INTERNATIONAL COUNCIL OF SCHOLARS

Mario SALMI, University of Rome, President

Marcel AUBERT, Membre de l'Institut; Director, Société Française d'Archéologie, Paris, Vice President
Ernst KÜHNEL, formerly, Director, Islamic Section, Berlin Museum, Berlin-Dahlem, Vice President
† Amedeo MAIURI, late Accademico dei Lincei, Naples
Gisela M. A. RICHTER, Honorary Curator, Metropolitan Museum of Art, New York, Vice President
Giuseppe TUCCI, University of Rome; President, Istituto Italiano per il Medio ed Estremo Oriente, Vice President

Alvar AALTO, Architect, Helsinki, Finland
Jean ALAZARD, University of Algiers
Andrew ALFÖLDI, University of Basel; Institute for Advanced Study, Princeton, N.J.
† Carlo ANTI, University of Padua
Gilbert ARCHEY, Director, Auckland Institute and Museum, Auckland, New Zealand
A. S. ARDOJO, Jakarta, Indonesia
Bernard ASHMOLE, Oxford University
Jeannine AUBOYER, Curator, Musée Guimet, Paris
Ludwig BALDASS, formerly Director, Kunsthistorisches Museum, Vienna
Sir John D. BEAZLEY, formerly, Oxford University
† Bernard BERENSON
W. BLAWATSKY, University of Moscow
† Albert BOECKLER, late Staatsbibliothekar, Munich
Axel BOËTHIUS, formerly, University of Göteborg; Director, Swedish Institute, Rome
† Helmut T. BOSSERT, University of Istanbul
Cesare BRANDI, University of Palermo
† Henri BREUIL, late Membre de l'Institut; Collège de France, Paris
Peter H. BRIEGER, University of Toronto
Joseph BURKE, University of Melbourne
A. W. BYVANCK, University of Leiden
Guido CALOGERO, University of Rome
Alfonso CASO, Escuela Nacional de Arqueología e Historia, Mexico City
† Carlo CECCHELLI, University of Rome
Enrico CERULLI, Accademico dei Lincei, Rome
Jean CHARBONNEAUX, Curator in Chief, Musée du Louvre, Paris
† Gino CHIERICI, late Superintendent of Monuments, Pavia
Fernando CHUECA Y GOITIA, Architect, Madrid
Sir Kenneth CLARK, Chairman, Arts Council of Great Britain, London
Giuseppe COCCHIARA, University of Palermo
George CŒDÈS, Honorary Director, Ecole Française d'Extrême-Orient, Paris
Paul COLLART, Director, Swiss Institute, Rome
W. G. CONSTABLE, formerly, Boston Museum of Fine Arts
Paolo D'ANCONA, University of Milan
Sir Percival DAVID, London
Guglielmo DE ANGELIS D'OSSAT, University of Rome
Otto DEMUS, President, Bundesdenkmalamt, Vienna
Paul DESCHAMPS, Director, Musée des Monuments Français, Paris
Roland DE VAUX, Director, Ecole Française, Jerusalem
Prince DHANINIVAT, President, Siam Society, Bangkok
Adrian DIGBY, Keeper of the Department of Ethnography, British Museum, London
† Einar DYGGVE, late Director, Ny Carlsberg Foundation, Copenhagen
Gustav ECKE, Curator of Chinese Art, Honolulu Academy of Arts; University of Hawaii
Vadime ELISSÉEFF, Curator, Musée Cernuschi, Paris
A. P. ELKIN, University of Sydney
Richard ETTINGHAUSEN, Freer Gallery of Art, Washington, D.C.
Bishr FARÈS, Institut d'Egypte, Cairo
† Paul FIERENS, late Curator in Chief, Musées Royaux des Beaux-Arts de Belgique, Brussels

NOTES ON THE ENGLISH EDITION

Standards of Translation. Contributors to the Encyclopedia, drawn from the outstanding authorities of over 35 different countries, have written in many languages — Italian, Spanish, French, German, Russian, etc. To ensure faithful translation of the author's thought, all articles have been translated into English from the original language, checked for the accuracy of technical terms and accepted English forms of nomenclature by English and American art historians, and correlated with the final editorial work of the Italian edition for uniformity and coherence of the over-all presentation. Naturally the McGraw-Hill Book Company, Inc., assumes full responsibility for the accuracy and completeness of all translations. Those articles written in English appear in the words and style of the authors, within the bounds of editorial attention to consistency and stylistic and organizational unity of the work as a whole. Article titles are in most cases parallel to those in the Italian edition, though occasionally they have been simplified, as *Dravidian Art* for *Dravidiche Correnti e Tradizioni.*

New Features. Although generally the English-language edition corresponds to the Italian version, a small number of purely editorial changes have been made in the interest of clear English-language alphabetization and occasional deletions or amplifications solely in the interest of clarity. Three major differences between the two editions do exist, however:

A considerable number of cross-references have been added in many places where it was felt that relating the subject under consideration to other pertinent articles would be of value to the reader.

A more extensive article on the Art of the Americas was projected for Volume One of the English edition with an entirely new text and many plates in black and white and color. This article was designed to give the completest possible coverage within the existing space of some 100,000 words to a subject which, because of its interest to the English-speaking public, was entrusted to a group of well-known American scholars, each expert in his respective area.

Some 300 separate short biographies have been added to the English edition to provide ready access to data on the lives, works, and critical acceptance of certain artists identified with schools, movements, and broad categories of historical development that are treated in the longer monographic articles. These articles are unillustrated, but works of the artists are represented in the plates accompanying the longer articles.

Bibliographies. The bibliographies of the original Italian edition have been amplified at times to include titles of special interest to the English-speaking world and English-language editions of works originally published in other languages.

In undertaking these adaptations of the Italian text and preparing original material for the English edition, the publisher has been aided by the generous advice and, in many cases, collaboration of the members of the Editorial Advisory Committee.

INDO-IRANIAN ART. Relations between northern India and the Iranian world or, more specifically, between the Indus Valley (see INDUS VALLEY ART) and occasionally the Ganges Valley and Iran, date back to very ancient times. Contacts were established mainly through the regions between the Indus and the Oxus (Amu Darya) rivers, such as Gandhara, through the provinces of Kapisa and Bactria (see BACTRIAN ART), which occupied the eastern part of the Iranian plateau, and at times through Drangiana (Seistan) and Arachosia.

Throughout the turbulent history of this vast zone, from the Achaemenian period until the arrival of the Arabs (ca. 6th cent. B.C. to 8th cent. of our era), these provinces were constantly changing hands, becoming either incorporated into northern India or annexed to Iran, to which their climate, way of life, and ethnic ties more closely related them.

Commercial exchanges and diplomatic relations alternated continually with conquests or migrations of populations who crossed the Hindu Kush and reached the Indus and the Punjab through the Kabul Valley. Historical events, trade, the exchange of man power and of religious beliefs were so many channels through which the art of Achaemenian, Parthian, and Sassanian Iran entered India. Thus elements of Achaemenian art (see IRANIAN PRE-SASSANIAN ART CULTURES) appear in ancient Indian art (from ca. 3d cent. B.C. to 1st cent. of the present era), while Parthian art influenced the Greco-Buddhist or Gandhara style (see GANDHARA), which flourished from the Oxus to the Punjab during the first centuries of our era, and to a certain extent the so-called "Mathura" style (see MATHURA), which flourished from the late 1st to the 4th century. It was during the Sassanian period (see SASSANIAN ART), however, that Iranian art made its most appreciable impact on India, particularly in the province of Kapisa, where an influx of Iranian culture promoted the flowering of a local style, called "Irano-Buddhist," which developed and evolved in the great monastic center of Bamian (3d to early 7th cent.; see AFGHANISTAN). Apart from its individuality, this style is of particular interest and significance for its relation to the art of the regions beyond the Oxus, in Sogdiana and Khwarizm (qq.v.), and for its influence on the art of Serindia (see ASIA, CENTRAL).

Bamian seems to have been the center for the transformation and diffusion of Iranian influence mixed with Indian elements, which appears in the frescoes of Kizil, Su-bashi, and Kumtura (late 4th–8th cent.) and which subsequently was modified and spread as far as China and even Japan. Toward the end of the 6th and during the 7th century, a fresh wave of Sassanian artistic influence, together with the stimulus provided by the art of Gupta (see GUPTA, SCHOOL OF) and Pala (see PALA-SENA SCHOOLS) India, gave rise to the development of a more sophisticated, rather baroque style, which might be termed "Sassano-Gupta." With this style, embodying an amalgamation or juxtaposition of contrasting tendencies, are associated the works of art discovered in a little monastery in Fondukistan and some late sculptures at Bamian.

SUMMARY. Historical relations between Iran and northern India (col. 2). Contributions of Achaemenian Iran to the artof ancient India (col. 3). Contributions of Parthian Iran to the Greco-Buddhis style and to that of Mathura (col. 5). The Irano-Buddhist school of Bamian (col. 8). Relations between Gupta and post-Gupta India and Sassanian Iran: the Sassano-Buddhist style of Fondukistan (col. 14). Reflections of Indo-Iranian art in the art of Serindia (col. 15).

HISTORICAL RELATIONS BETWEEN IRAN AND NORTHERN INDIA. "India, in centuries and perhaps millenniums B.C., was an integral part of an 'Ancient East' that extended from the Mediterranean to the Ganges Valley. In this ancient world there prevailed a common type of culture, which may well have had a continuous history . . . ." A. K. Coomaraswamy, in his *History of Indian and Indonesian Art*, thus emphasizes the ties which have bound India to Iran from the remote past. Excavations, many quite recent, have demonstrated the similarities that existed between the civilizations of Susa and Mesopotamia and those which flourished from the 4th to the 2d millennium at Harappa and Mohenjo-daro in the Indus Valley, in Baluchistan, and in southeastern Afghanistan (recent excavations at Mundigak). The migrations of the Aryans (or Indo-Iranians) toward the Punjab, during the 2d millennium B.C., still may be considered the source of the tie that existed between Iran and India. However, relations between the two regions were not permanently established until the end of the 4th century B.C., when the Achaemenids conquered and occupied the Indus Valley. This conquest may have been begun by Cyrus (558–529 B.C.) and continued by Darius immediately upon his accession. At all events, Bactria, Kapisa, Gandhara, the Punjab, and Sind became satrapies of the Great King, and it was as successor to the Persians that Alexander the Great laid claim to the suzerainty over these regions at the time of his expedition into India (327–325 B.C.). After the death of the Macedonian conqueror, cordial relations were established between the Seleucids and the Maurya emperors, who had extended their dominion as far as the southern part of the Hindu Kush by means of an agreement. The sojourn at Pataliputra of Seleucus's ambassador Megasthenes, between 304 and 297 B.C., attests to the reciprocal feelings of good will and suggests that exchanges took place between the two courts — exchanges that were expressed in the realm of art. Relations with India were maintained during the period of turmoil attendant on the decline of Seleucid power in the eastern part of the Iranian plateau, though often these were of a less cordial nature [Antiochus III's expedition up the Indus, 206 B.C.; conquests of Demetrius and Menander (Melinda), 2d cent. B.C.]. For about two hundred years, from the middle of the 3d century, India saw the establishment of a series of Greco-Bactrian and then Indo-Greek dynasties, which undoubtedly left a Hellenic stamp, tinged with Iranism, on the regions extending from the Oxus River to the Punjab and sometimes even beyond. The penetration of Iranian culture into India was promoted by the invasion of the Śakas, Scythian tribes who came from beyond the Oxus in about 130 B.C. Having settled for a time in Drangiana (which had become Sakastan), where they were exposed to the influence of Parthian Iran, these tribes finally reached the Indus Valley in about 75 B.C., under their leader Maues. From about 30 B.C. to the mid-1st century, first under Azes and then under Gondophares, a Śaka ruler of Parthian origin, they seem to have extended their dominion from Kapisa to Sind and to the eastern Punjab.

The arrival of the Yüeh-chih (probably another tribe of Iranian Scythians) opened a new era of contact between India and Parthian Iran, with subsequent artistic influences. Although established in Bactria by 130 B.C., the Yüeh-chih did not extend their dominion to the southern part of the Hindu Kush until about one hundred years later. The clan of the Kushans (see KUSHAN ART), having established its supremacy in the latter part of the 1st century of our era, under Kujūla Kadphises and his son Wima Kadphises, founded a powerful dynasty which immediately unified under its rule the provinces extending from Mathura to the north of Bactria. The great Kushan rulers, Kaniṣka in particular, brought peace and prosperity to these regions, where various composite cultures flourished side by side. The eclecticism of the dynasty is demonstrated by its coins, on which Greek inscriptions are combined with hybrid Iranian motifs, and Iranian divinities (such as Mithra) alternate with Hercules, the Buddha, sometimes Śiva, or with the symbols of these. Protectors of Buddhism (q.v.), the Kushans promoted the construction of numerous monasteries and religious monuments, thereby stimulating the development of a complex style known as Greco-Buddhist.

With the rise of the Sassanian dynasty in Iran relations with India were revived, although established on a different basis. After the conquest of Bactria by Ardashīr I (226–41), the Kushans were driven back to the southern part of the Hindu Kush and seem to have recognized the Sassanian supremacy. The subsequent diffusion of Sassanian culture is attested by the magnitude of its influence on the art of northwestern India (Irano-Buddhist school of Bamian). Although the Ephthalite invasion, in the mid-5th century, hardly affected the artistic production of this school in the region of the Hindu Kush, it caused tangible and irreparable damage in Gandhara and the Punjab, where most of the monasteries were totally destroyed.

The Ephthalites were driven out of Bactria by a coalition of the Turks and the Sassanians under Khusrau (Khosrau, Chosroes) I, who remained master of the province. Before 597, however, under their khan Tardu, the Turks had in turn driven the Persians out of Bactria, which was renamed Tokharistan. According to Hsüan-tsang, who visited the regions to the north and south of the Hindu Kush about 630, the Turkish rulers were favorably disposed toward Buddhism, whose vitality is attested by the works of art (PLS. 4, 6, 7, 11) found in the little monastery at Fondukistan (from coins of Khusrau II, it can be dated between 590 and 628). It was not until the arrival of the Arabs, in the latter half of the 7th century, that the development of Buddhist art in this region finally ceased.

Although it was primarily historical events which brought India and Iran into contact, several other factors contributed to the establishment of relations between the two countries. The discoveries made in such places as Taxila and Begram have proved the intensity of the commercial and other exchanges which went on between northwestern India, or Kapisa, and western Asia from before the beginning of the Christian Era. Regions where Iranian influence was paramount were situated along the road which ran from the Indus River to Balkh (anc. Bactra) and there joined the immense caravan route, called the "Silk Route," which linked China to Iran and to the Mediterranean world beyond. Even when traffic followed the maritime route, it continued to unite India with the Iranian border; beyond the Persian Gulf the route rejoined the great caravansaries of Dura-Europos and Palmyra — frontier zones where Roman and Parthian civilizations existed side by side. The regions open to continual Iranian influence were those closest to Iran, where geographical conditions imposed a similar mode of living and the art reflected a gradual penetration of religious beliefs. Although most of the regions which had once constituted satrapies of the ancient Achaemenian empire eventually drifted away from Iran and, chiefly through their adoption of Buddhism, entered the India orbit, the traces of their former heritage have remained very much in evidence.

CONTRIBUTIONS OF ACHAEMENIAN IRAN TO THE ART OF ANCIENT INDIA. A. K. Coomaraswamy (1927) frequently refers to the cultural and religious affinity between the ancient civilizations of Iran and India. This would account for the similarities in various decorative and symbolic motifs, in certain aspects of the mythology, and, more especially, in the importance of the worship of the sun and of fire. Numerous representations of the Devī (earth divinity or mother goddess) in the art of ancient India stem from this affinity of religious beliefs. Beginning with the nude goddess depicted on a small gold plaque found in a Vedic funeral mound (8th–7th cent. B.C.) at Lauriya Nandangarh, an assortment of terra cottas found between Pataliputra and Taxila perpetuate in a variety of forms the theme of the goddess as bestower of fertility [discoveries made at the Bhir mound in Taxila and at Mathura; the winged goddess from Basarh (anc. Vaisali), etc.]. These works, dating chiefly from the Maurya and Śuṅga periods, were the prototypes of later representations: those of Lakṣmī and especially those of Māyā (the Buddha's mother) as she is represented in the bas-reliefs on the stupas of Bharhut and Sanchi (ca. 2d cent. B.C.–1st cent. of our era) and, on a monumental scale, on the façade of the chaitya at Manmoda. The depiction of fire altars on seals and coins is further evidence of contact between India and Iran.

The influence of Achaemenian Iran is more readily discernible in the architectural and decorative fields; sometimes there are similarities in technique. However, Indian art had already passed through the preliminary stages of development by the time perishable materials were abandoned in favor of stone. Thus, we must base our judgment on its mature aspect and can only make conjectures as to its formation and the gradual process of adoption and incorporation of Iranian artistic traditions into its own.

Aśoka's palace at Pataliputra, built about the mid-3d century B.C., seems to have equaled in splendor the Achaemenian palaces at Susa and Ecbatana (mod. Hamadān). The remains of a great hall with stone columns are reminiscent, in their disposition, of the hypostyle halls at Persepolis. An indebtedness to Iran is palpable in the aspect of the tall pillars, or lats, scattered singly throughout the various provinces of Aśoka's empire, on which this pious Buddhist had his edicts inscribed (II, PL. 399). The beautiful polish of the stone implies an Iranian technique, probably introduced by the Iranian artists who worked at Aśoka's court. The bell capital is of a Persepolitan type: the effect of fluting, obtained from the carving around it of elongated lotus petals, is similar to that on Achaemenian capitals and bases. This type of bell capital was long retained in India, where it evolved and gradually assumed a more purely Indian form. Used to frame doors and gateways (e.g., the stupa at Bharhut), it also dominated the shafts of the columns in the rock-carved chaityas dating from the beginning of our era or possibly even later (Bedsa, Karli; II, PL. 410; VII, PL. 451). The Persepolitan combination of capital and protomas of animals, the latter functioning as a support for the architrave, was also taken over in India in a modified form. In the chaityas, now and then on the toranas, and in carved architectural details protomas of animals or (more often) crouching animals figured above bell capitals. Numerous examples of this combination are to be found in the relief carvings at Bharhut, Sanchi, Mathura, and Jaggayyapeta and among the carved ivories from Begram, Afghanistan, with representations of toranas. The animals often were winged and addorsed and served a decorative rather than structural purpose.

Together with a variety of obviously indigenous motifs, ancient India's decorative repertory contained many Iranian elements, or rather elements that had come to it through Iran. It was, in fact, through Achaemenian art that motifs of a far more distant and more ancient origin reached India (e.g., Hittite, Assyrian, Hellenic), and although the earliest evidence of their penetration into India is in works of stone of the Śuṅga period, they may have appeared much earlier in objects of wood, clay, ivory, and other perishable materials.

To this assortment of imported motifs belongs the majority of the mythical animals which abound in the relief carvings on the toranas and balustrades of stupas and which reappear on the collection of Indian carved ivories that came to light

at Begram: animals in profile with their heads turned to face the viewer, animals face to face or back to back, winged lions, griffins, and many others. The variety of imported motifs also includes decorative elements: the tree of life, the palmette, certain rosettes, perhaps the blue lotus depicted in profile, the saw-tooth molding, and the typically Iranian graded crenelation disposed in a frieze. Even composite themes were transmitted to India, such as the four-horse solar chariot, or chariot of Sūrya. These motifs often were modified slightly, as in the case of the flowing vase from ancient Mesopotamia, which reappeared as a vase of lotus flowers. As J. Hackin has suggested: might not the monster-tamers depicted on the ivories discovered at Begram be the ultimate descendants of the legendary Sumerian heroes, Gilgamesh and Enkidu, or of the enigmatic divinities of Luristan grappling with wild beasts?

The graded crenelations and the palmettes reappear almost unaltered at Mathura (2d–3d cent.), together with a host of winged monsters from Iran, which also appear in the more southern Amaravati style. These monsters, particularly the lion, as well as the motifs of the tree of life and the vase of abundance, eventually were transmitted as far as southeast Asia.

Contributions of Parthian Iran to the Greco-Buddhist style and to that of Mathura. The constant intercourse between India and Iran during the centuries preceding and following the beginning of the Christian Era brought a continual influx of Parthian artistic ideas into India. At the same time the establishment of Greco-Bactrian and Indo-Greek dynasties in the area between the Oxus and the Punjab certainly promoted the spread of Hellenic culture; however, it affected only the thin upper stratum of the population and was itself strongly admixed with Iranian elements, as is evident from the coins of this period: miscellaneous Greek deities among various Iranian divinities (Artemis-Anahita, the sun gods, and various bearded divinities). The contacts between India and Iran were multiplied by the arrival of the Scythians (Śakas) and then the Parthians, who had settled for a time in Drangiana before reaching the Indus. According to E. Herzfeld (1935), the frescoes at Kuh-i-Khwaja (Seistan) would seem to date back to the time of Gondophares (beginning of our era). These frescoes, of combined Greek and Iranian inspiration, may have influenced the art of the neighboring regions, but it is impossible to estimate the extent of their effect upon the Greco-Buddhist painting of northwestern India, since this painting is almost entirely unknown. It is, in fact, only on the coins of the Śaka and Parthian dynasties (III, pl. 399) and of the Kushan dynasty which succeeded them (pl. 409), that traces remain of this contact with Iran. Its influence and inspiration is manifest in the type of costume (long, flared mantle and high, supple boots), in certain poses, and in various details (circular or rayed halos, flames issuing from the shoulders of King Wima Kadphises and his successors). Such Iranian divinities as Mithra are included in the complex pantheon represented on the coins of the great Kushans, on some of which Kaniṣka himself is shown in the act of placing grains of incense on a fire altar.

The proximity of Iran affected religious beliefs and consequently art. Kaniṣka, who was one of the great protectors of Buddhism, and who had Buddhist monasteries and stupas built throughout his kingdom, had extremely eclectic tastes; this fact is confirmed by the recent discovery of the fire temple at Surkh Kotal in Bactria (II, pl. 86), which presumably can be attributed to him. Besides the Jandial temple near Taxila, which Sir John Marshall (1951) dates in the first century of our era, and which has been identified as a sanctuary of Ahura Mazda, other vestiges of Mazdaism would seem to subsist at Kunduz, while the old temple at Multan, near the Indus, appears to have been administered by Magi. Alfred Foucher (1942–48) drew particular attention to the influence exerted by Iranian Mazdaism on Buddhism, in consequence of which Buddhism evolved from a Hinayana to a Mahayana form. The whole conception of the Buddha as a human being was thereby altered; henceforth he was a deity. This evolution, which also brought about an expansion of the Buddhist pantheon, is reflected in the art of the Kushan epoch. Although anecdotal representations of episodes in the life of the Buddha Śākyamuni continued to multiply in relief carvings on minor stupas, the veneration for them tended to diminish in favor of more impersonal, more superhuman images of the Buddha and the bodhisattvas. This impersonal type of cult image became ever more frequently reproduced on stupas (at Hadda and Taxila) and in the painted vaults and niches of Buddhist sanctuaries (at Bamian). Halos, which perhaps were copied from Iran and its solar divinity, indicate this superhuman quality of the Buddhas and the bodhisattvas. At Paitava and Shotorak, near the Hindu Kush, flames issue from the shoulders of the Buddhas Śākyamuni and Dīpaṅkaṛa (pl. 2) and from the bodhisattvas. Jacques Meunié (1942) has suggested that the purpose of these flames was "to materialize in the eyes of the faithful the holiness and majesty of the person represented"; at Bamian they appear even on "human beings of great importance, such as certain kings of Persia." These flames and the flakes of fire bordering the halos on the steles at Paitava and Shotorak are strongly reminiscent of the veneration for the cults of fire and of light in this region.

The influence of Parthian Iran is manifest in the Greco-Buddhist style, or style of Gandhara (q.v.), which flourished under the Kushans, particularly between the Oxus and the Punjab, probably from the end of the 1st century of our era to about the middle of the 5th. The composition of this style appears increasingly complex; the influence of Parthian Iran is intermingled with elements of Alexandrian and Syrian Hellenism and with those of Roman origin, while themes and forms from the art of ancient India also appear. It is seldom easy to trace the origin or course of Hellenic themes and motifs, since these circulated throughout the whole of Asia Minor and were reproduced and exchanged over a period of several hundred years, from southern Russia to India, from Alexandria, and even from Rome, to the Scythian world of Transoxiana.

In the constant ferment of civilizations in and beyond what may conveniently be called the Near East, certain motifs and traditions persisted, although gradually they were transformed. Frequently, through the agency of Parthian Iran and under a Greco-Iranian aspect, they came to be incorporated into the art of northwest India, where they were further modified and transmitted to nearby Mathura, to Serindia, and through the latter to China and even to Japan.

A. Foucher (1905–22) perceived the relationship between the school of Gandhara and the contemporary schools of Antioch, Palmyra, Susa, and Seleucia, and pointed out the similarities between the Parthian city of Dura-Europos and that of Sirkap (Taxila). Sir John Marshall drew attention to the similarities between the palace at Sirkap (ca. 1st cent. of the present era) and the Parthian palaces at Ashur, Dura, and Nippur. However, it is chiefly Daniel Schlumberger's recent research in this field that has revealed the magnitude of the Parthian contribution to Kushan art and defined its nature. This archaeologist sees in Greco-Buddhist art "the Indian descendant of Greco-Iranian art," the former having derived from the latter its predilection for frontal representation and monotonous alignment. The existence of analogies between Parthian art at Palmyra, Dura-Europos, and Hatra and the art of the Kushan epoch in Bactria, Kapisa, northwest India, and to a lesser extent, Mathura, thus has been firmly established. Indeed, a striking similarity is often apparent in the treatment of drapery folds or acanthus leaves, in the use of the same motifs, and, for instance, in the profile of a laurel-leaf molding at Palmyra, which reappears as far away as Mathura.

Elements related to those of Iran are more prevalent in the regions closest to Iran, such as Kapisa and Bactria. At Shotorak the vine scroll and the eglantine with five petals (VI, pl. 25) were frequently reproduced, and there, as at Paitava, bearded donors are represented in the costume of the cold regions, worn by both Scythians and Iranians: a belted, pleated tunic, long trousers reaching down to soft shoes, and often a flared mantle of the type worn by the Parthians and the Kushans and also the fashion at Dura-Europos. The female donors were dressed according to a western fashion which

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

continued in Sassanian Iran: a long gown with sleeves, and a voluminous shawl fastened over the left shoulder, leaving the right one bare (PL. 3).

The spirit of Parthian Iran also pervades the fragments of a frieze found at Airtam, near Termez (anc. Tarmita). This extremely beautiful piece of carving (of the 1st or 2d cent. of our era), which probably came from a Buddhist monument, shows a row of musicians or bearers of garlands and necklaces, emerging from a border of acanthus leaves that separate the figures. The frontal representation, the alignment, the sturdy forms, and the rather heavy features of the beautiful, serenely smiling faces are all characteristics which relate this frieze to works of Greco-Iranian tradition. The arched squinches supporting the domes at Kunduz and Haibak (II, PL. 87) were derived directly from Iran, whose influence is also abundantly manifest in the fire temple at Surkh Kotal, in Bactria. Since its discovery by Schlumberger in 1952, this site has been the object of a series of excavations (II, PLS. 86, 87, 89). The vast ensemble is situated on the top of a hill and bounded by a rampart. The central temple stands in a rectangular court, which is enclosed on three sides by fortified walls, with the fourth side opening onto a monumental stairway that descends, in three stages, to the level of the plain some 800 ft. below. The complex also includes a secondary temple which is probably of a later date. The main temple would seem to date back to the time of the great Kushans, that is, to about the 2d century of our era, although more precise information on this point undoubtedly will be provided by an important inscription which has been discovered.

Schlumberger has clearly specified the relationship of this complex to the Buddhist monuments of the period and to Iranian tradition. His analysis covers the method of construction, the plan, details of architectural decoration, and similarities of costume, pose, and theme in the sculpture. As to the method of construction, "the association of unbaked bricks for the foundations, of freestone limited to certain organs, and of great heavy beams for the roof ceases to appear unusual when one recalls the Achaemenid monuments, which provide excellent examples thereof" (*JA*, 1952, p. 448). Originally, the square cella of the main temple was surrounded on three sides by an ambulatory; the roof was supported on four columns placed at the corners of the platform of the fire altar. To Schlumberger, this plan suggested comparison with the fire temples at Susa, Persepolis, Hatra (Mesopotamia), and Kuh-i-Khwaja. With regard to the architectural decoration, whereas the Attic bases of both the columns and the engaged pillars, distributed around the walls of the cella, are of Hellenistic origin and Greco-Buddhist tradition, the merlons are essentially Iranian, and their loopholes in the form of arrowheads are copied directly from Achaemenian and Parthian examples.

Of the sculptures that have come to light, the most, interesting are the badly damaged remains of three large statues which must have represented the investiture of the king by the god, a theme of Iranian tradition. Here again, Schlumberger noticed a correspondence between these three statues at Surkh Kotal and three statues found in the dynastic temple at Mathura, at the other extremity of the Kushan empire, and, indeed, in both costume and pose the Mathura statues bear a striking resemblance to the Surkh Kotal group. Each of the Mathura figures wears a long tunic with a wide galloon down the front, long trousers reaching to heavy felt boots, and a flared mantle which is held together across the chest with a clasp of double cabochons and which opens and stands out from the waist, giving the figure a pyramidal silhouette. These tunics and long trousers were the costume of the Scythian horsemen, worn by the Kushans during the 2d and 3d centuries and later adopted by the Parthians. The flared mantle, similar to those of the Surkh Kotal statues (II, PL. 89), reappears at Dura-Europos, at the other extremity of the Iranian empire, where Parthian fashions often were adopted. Likewise, the wide galloon down the front of the tunic, a handsome example of which is preserved on a statue at Surkh Kotal, recalls the ribbons which embellished the costumes at Dura-Europos and Kuh-i-Khwaja and which reappear on the statue of Sūrya at Khair Khaneh (Kabul region, ca. 5th–6th cent.). The effect of grandeur and stability induced by the rigidly frontal and hieratic pose of the Surkh Kotal statues is equally and similarly obtained by the statues of the Kushan kings at Mathura; even the divergent position of the feet is common to both groups (PL. 1). A corresponding quality of grandeur and vigor marks the few extant Parthian statues (e.g., the bronze statue from Shami, PL. 141), in which the same frontal representation and often even the same conception of form may be noted (particularly on the steles). As Schlumberger expressed it, Parthian art did not aim to create "an illusion": bodies were flattened out, their natural volume disregarded, and clothing was merely outlined on a convex mass (many of the Buddhas on the Greco-Buddhist steles were conceived in the same manner). A small figure carved in high relief on a merlon, seated with elbows and knees turned outward, is of the same style and is related to the statue of an enthroned king at Mathura with a fire altar on its base.

The art of Surkh Kotal thus constituted one of the more important manifestations of the great movement of Iranian, or rather Greco-Iranian, art that spread to the west as far as Palmyra and Dura-Europos and to the east as far as the Indus Valley, Mathura, and Kashmir (terra cottas of Harwan), and even beyond. A low relief from Mathura (to which the merlon figure of Surkh Kotal is also related) showing the god Sūrya crouched in his chariot and the horses deployed to either side of the axletree belongs to a series of representations of the same type. Henri Seyrig, in a study on the "spread eagle" chariot (as he called it, in reference to the position of the horses), and Mario Bussagli, in a study on the frontal representation of the divine chariot (1955), both have noted the persistence of this arrangement in India (at Bodhgaya and Khandagiri) and Serindia, to which the motif was transmitted, as well as in the more westerly regions. According to Bussagli, the frontal representation of this Iranian motif in India might correspond to an ancient indigenous tendency, encouraged by the Iranian influence of the Śakas, which may itself have come from the predilection for frontal representation noted in the art of Luristan and Sumer. Foucher (1942–48) also remarked on the persistence of Iranian influence in the representations of Sūrya, identified with Mithra. The white marble statue of Sūrya in the Brahmanic sanctuary at Khair Khaneh in the Kabul region (ca. 5th–6th cent.) appears to be descended directly from an Iranian prototype; not only the costumes of the god, his two assistants, and a donor, but even the gesture of a worshiper who offers the deity a beribboned crown are in the Iranian tradition. The bead molding, which emphasizes the details of the costume, reflects a fashion that became popular in the Sassanian period. This fashion, which also was transmitted to Bamian, spread to India with the development of the Gupta style. This accounts for the beaded medallions of lotus flowers and the ornamental fasciae on columns. It was Hackin who first pointed out the similarities between the figures of the group at Khair Khaneh and others found at Bhumara (in India; late 6th cent.?) with the characteristic Sassanian ribbons.

THE IRANO-BUDDHIST SCHOOL OF BAMIAN. The establishment of the Sassanian dynasty in Iran by Ardashīr I (226–41) appears to have had immediate repercussions on the art of the neighboring regions, particularly at Bamian, which came within the confines of the vast Sassanian empire upon the annexation of Bactria by the Sassanians during the 3d century. This dynasty promoted in Iran a revival of national traditions which extended to the arts in the form of a return to Achaemenian principles of symmetry and stability — notwithstanding their previous modification by outside influences. Ancient Iranian traditions, new Sassanian forms, and contributions from various other regions (particularly from Roman Syria) all penetrated to Bamian, there to amalgamate with the iconographic traditions of Indian Buddhism, with elements derived from the Gandhara style, and, later on, with the influence of Gupta India. The fusion of all these elements gave rise to a highly individual local style which Hackin, because of its predominantly Sassanian qualities, called "Irano-Buddhist."

As a major stopping place on the road from Bactria to Taxila, where caravans crossing the Hindu Kush stopped to rest and revictual, the fertile valley of Bamian was renowned especially for its great monastic establishment, which flourished from the 2d to the 8th century. Nothing remains of the monasteries built at the foot of the great sandstone cliff dominating the valley to the north, their domes having long since been damaged by the fall of loose rock. The Buddhist monks, however, profiting from the facility with which the sandstone could be worked, carved enormous images of seated and standing Buddhas (PL. 10) and a network of monasteries out of the cliffs all around and beyond the valley. Most of the monasteries comprised a vast assembly hall, a sanctuary, and a few cells for the monks. A large number of them were uncovered and explored between 1923 and 1933 by the Godards and Hackin, aided after 1930 by J. Carl. Giuseppe Tucci recently directed the investigation of another group of caves a little farther off.

The sculpture contributes but little to the knowledge and understanding of the art of Bamian. Neither the colossal standing Buddhas (one 120 ft. high, the other 175 ft. high; PL. 10) nor the various seated Buddhas are of much interest apart from the influence they had on the art of nearby and distant regions through the small-scale copies carried by pious pilgrims. The numerous Buddhas in high relief which occupied the large niches in the sanctuaries and the coffers in some of the domes all have disappeared. The few heads recovered seem to correspond either to the models in stucco found at Hadda (those of Cave G) or to some of a later date found at Fondukistan.

An examination of the various monasteries at Bamian reveals the characteristics of the Irano-Buddhist style of architecture and painted and relief decoration, to which the sanctuary exacavated in the nearby valley of Kakrak (PL. 8) is also related. According to B. Rowland (1938), the paintings found at Bamian may be regarded collectively as having been executed within a short period of time and at a relatively late date. On the contrary, it seems more probable, as Hackin repeatedly had occasion to argue, that the processes of carving out and decorating the monasteries and of decorating the niches of the colossal carved Buddhas went on continuously throughout the long period of occupation of this site. Although it remains almost impossible to put a definite date to any of the work at Bamian, careful study reveals an evolution in its style, the main lines of which still seem to be those set forth by Hackin. To a framework of Greco-Buddhist traditions were added Sassano-Iranian elements which were initially predominant in the local style evolving from this fusion. Subsequently, Gupta Indian influence came to balance and at length outweigh that of Iran, thereby modifying the character of the later work. As a group, the caves in the vicinity of the 120-ft. Buddha at the eastern end of the valley (commonly designated by letters) are earlier than those near the 175-ft. Buddha on the far side, to the west (designated by Roman numerals). The colossal image of the 120-ft. Buddha probably was begun toward the 2d century of our era, while the most recent work (around the 175-ft. Buddha), from the later period of activity on this site, would seem to be of the 6th or even the 7th century.

The sanctuaries and assembly halls are simple in plan, either rectangular, circular, or octagonal; some have quite an elaborate type of ceiling (cells of Group F, Caves V and XV) composed of beams superimposed diagonally across the corners of a square to form successive tiers of squares progressively diminishing in size (PL. 13). This type, which also was used in the region of the Pamirs, would seem to be of western origin and to have come from Armenia, Anatolia, and Georgia. Most of the sanctuaries, however, have vaulted ceilings of Iranian type, which underwent a clearly discernible evolution here at Bamian. Thus, whereas in Cave G, which appears to be the oldest, a representation of arched squinches effects the transition from the square sanctuary to the dome (an expedient which was applied in some of the halls of Group E), in the majority of the caves, for which either a circular or an octagonal plan seems generally to have been adopted, the transition from the vertical surface of the walls to the dome is effected by one or two courses of corbeling. This corbeling subsequently assumed increasing importance in a number of the caves near the 175-ft. Buddha (I, II, and XI), tending to raise considerably the level of the dome, which then became flatter. On the other hand, it appears that the decoration of the oldest caves (C, D), which had consisted primarily of paintings, was later replaced by ornament in relief (I, XI). In a recent study Bussagli discusses the adoption by the monks at Bamian of the octagonal plan traditional in Iranian architecture.

The art of Bamian was essentially religious and dedicated to the service of Buddhism in its Hinayana form (see BUDDHISM). The tendency toward constant repetition of the same or similar aspects of the Buddha, which recalls the endless reproduction of the figure of the Master on the stupas at Hadda and Taxila, appears early. Through these frescoes it is possible to trace the formation and development of the Irano-Buddhist style and, despite the confusing interspersion of hybrid elements, to distinguish the main lines of its evolution.

Apart from the Iranian contribution of the arched squinches, the decoration of Cave G, with its clay heads from the central stupa (resembling those at Hadda), its garland motif, and the Buddhas painted in the dome, is in the Hellenistic and Greco-Buddhist tradition. Only a donor displays the regional costume of a long tunic with double revers, which reappears in Serindia.

Sassanian influence, which probably penetrated toward the end of the 3d century, is first manifest in various details of the decoration and thereafter in the iconography, in the costumes, and even in the style of painting. Traces appear in Groups C and D, near the 120-ft. Buddha, in the typically Iranian ribbons of pleated material that widen out at the ends. These ribbons, or kusti, apparently were an emblem of dignity in Iran. They are found on the diadems, vestments, and sometimes even the mounts of gods and monarchs and are also used as architectural decoration; they figure as often in the great relief carvings on the rocks (at Naqsh-i-Rustam, Shapur, and Taq-i-Bustan) as in Sassanian goldwork. Transmitted to Bamian, where they enjoyed an equal vogue, they first appeared as accessories in the decoration of the painted domes of the assembly halls and sanctuaries of Group C, where they framed a vaselike motif — an Iranian element — above the arches surrounding the standing Buddhas or were strewn over a background studded with little flowers. In costume, pose, and gesture the seated and standing Buddhas in this group remain within the Greco-Buddhist tradition, but their halos — composed of concentric circles of different colors — and the bold contrast of tones is characteristic of the Irano-Buddhist school. These details, and the entire composition in the dome of Sanctuary C, later were transmitted to Serindia, to Kirish, and to Sim-Sim, and, in a more fully developed form, to Kizil (Cave of the Pigeons; I, PL. 480).

The influence of Iran is still more apparent in the decoration of Group D. In the vestibule, the beaded moldings and the motifs in the medallions on the flat ceiling are unmistakably of Iranian origin: the winged horse, the often repeated boar's head, and the extremely beautiful composite design of two birds, back to back, heads turned to face the spectator, holding in their beaks a string of pearls. On the ceiling of the sanctuary, which has an unusually large number of simulated beams, are a series of heads in relief; these vigorous masks of mustached men with sinuous beards and conical caps also are descended from an Iranian tradition, though one of more ancient origin.

The painted decoration of the niche sheltering the 120-ft. Buddha attests to a renewal of influence from Iran. The soffit of this niche is covered with a vast composition, the subject matter of which is derived directly from the cults practiced in Parthian Iran and western Asia and, in particular, in the caravansaries of Palmyra and Dura-Europos, to which several details can be traced. The painting shows a towering solar or lunar divinity in a chariot drawn by four winged horses grouped in pairs and shown in profile on either side of the chariot. The large halo encircling the divinity is bordered with short rays, recalling the rayed halos of Iranian tradition. The figure was first identified as a lunar divinity, because of a whitish crescent

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

perceived within the lower part of the halo. A closer examination, carried out under better conditions at the time that Carl was making a copy of the composition, has shown that this supposed crescent is merely a space left blank between the halo and the voluminous cloak that unfurls in a semicircle around the god. Since the identification of this figure as a lunar divinity thus would seem to have lost its foundation, it is perhaps equally plausible to regard him as a solar divinity, unless the flight of geese depicted in the upper register is to be considered a reference to the role of the lunar god as escort of the souls of the departed to paradise. As Hackin pointed out, in the paintings of Central Asia, and notably in those at Kizil, geese symbolizing these souls frequently were shown hovering around the moon. The veneration of the sun god in his chariot, as M. Rostovtzeff has noted (1938), is of very ancient origin, going back to the dawn of Iranian history; in the Vedas Mithra is also described as riding in a chariot. The representation of the sun god in his chariot would seem to have originated from a Greek prototype modified by Greco-Iranian artists (ca. 3d cent. B.C.), while representations of the Indian Sūrya, of the type found at Bodhgaya, probably were derived from the Greco-Iranian model.

The disposition of the horses deployed to either side of the chariot, common to Bodhgaya and Mathura and preserved in this composition, was not adopted for representations of the sun god at Dura-Europos, but it reappears in Sassanian portrayals of this theme. His armament and costume relate the divinity at Bamian to the solar and lunar gods deeply venerated and often represented at Dura-Europos and Palmyra and in Parthian and Sassanian Iran. He holds a long sword and a spear and wears a great cloak which is fastened across his chest with a clasp and which falls behind from his shoulders. The same mode of adjusting the cloak across the chest and the same cabochon clasp with which it is held are noted on the figure of a winged genie in a mosaic at Bishapur (latter half of 3d cent.). The long tunic with the galloon down the middle is a variant of the tailored garment worn throughout the Iranian plateau regions and in both Russian Turkistan (e.g., Pyandzhikent, Varakhsha) and Chinese Turkistan (e.g., Kumtura, Kizil; I, PL. 479). On either side of the central motif of the divinity in his chariot is a row of donors on a balcony. The bearded faces and vigor of these figures are reminiscent of Iran, while various details are derived directly from Sassanian art. Kusti flutter from the shoulders of each donor and from those of the bodhisattva in the center of either row. According to Hackin, the coiffure is the same as that on Sassanian coins of the 4th and 5th centuries, notably those with the image of Bahrām II. Particularly characteristic is the diadem with a large sphere in the center.

The hieratic conception, rigid pose, and bold coloring of a bodhisattva painted on the soffit of the niche of a seated Buddha (Group E; PL. 13) attest to the presence of Iranian stylistic tendencies in the Irano-Buddhist school at Bamian; the immobile pose and intense gaze lend this figure a certain mystic strength. The details of the coiffure and of the costume are Iranian, while the chaitya arch that frames the bodhisattva and the balconies, each dominated by a figure, are typical of the Greco-Buddhist style. The constant juxtaposition of Indian and Iranian elements at Bamian was due partly to the consistent dealings there with both India and Iran and partly to the fact that artists of both schools frequently worked side by side. A typical example of this cooperation is a bodhisattva of Group I (published by Rowland) in a rigid pose, with costume of Indian fashion, who holds a stem with three flowers like the plants of Sassanian landscapes; at the same time, the conventional use of a fluttering ribbon resembles the kusti of Shāpur I and Bahrām II at Naqsh-i-Rajab and Bishapur. The scarf wound sketchily around the body is another detail characteristic of the Irano-Buddhist art of Bamian; the motif of this perennial strip of gossamer, with its unrealistic undulations, may be seen on the figure of a stringed-instrument player at Pyandzhikent (Russian Turkistan, 7th cent.) and appeared in the later works of Tun-huang (q.v.; II, PL. 398), at the eastern terminus of the Silk Route.

The influence of Gupta Indian art often was blended quite felicitously into the already assimilated influence of Iran. The essentially Indian motif of a balcony with figures half-concealed (first used at Bharhut) appeared constantly. In Group I (PL. 12) a troupe of supple and lively, if rather heavy, female dancers and musicians appear in an otherwise austere and schematic composition with rows of medallions each containing a Buddha. These fair and dark-skinned female figures of different ethnic types display the familiar Iranian ribbons, which here float more naturally. The figures seem to wear tight-fitting, low-cut corselets exposing their breasts (I, PL. 476); like the braided coiffure, this fashion is encountered frequently in Central Asia, at Tumshuk, Kizil, Kumtura, and Shorchuk.

The same amalgamation of Indian and Iranian elements and features of the fully developed Irano-Buddhist style stands out in the paintings that embellish the dome of one of the sanctuaries in the nearby valley of Kakrak. The iconography has remained extremely simple: the same Buddhas are constantly associated and repeated in a sort of monotonous "litany," which nevertheless is not lacking in a certain austere grandeur (PL. 8). This composition at Kakrak assumes the aspect of a mystic diagram, or mandala. In the center of the dome is a huge image of Maitreya seated in the Indian style and surrounded by a circle of smaller seated Buddhas. Around this central motif is a broad fascia enclosing a series of lesser circles of small Buddhas, each grouped about a larger seated Buddha; more Buddhas of the same type occupy the spaces between the circles, all of which have borders of beading. The lower register comprises a row of Buddhas seated under a succession of pedimented arches supported on small, beribboned columns. Gupta India's contribution is manifest in the suppleness of the bodhisattva, draped in the toga of the great Buddhas, which leaves the chest and right shoulder bare, and tracing the prescribed symbolic gestures (mudra); the beauty of the graceful and expressive hands is likewise an Indian attribute, at Kakrak as at Bamian. The essence of Irano-Buddhist art is manifest in the robustness, rather stocky proportions, and square faces of these Buddhas, in the almost diagrammatic regularity of the composition, and in the boldness of the colors. The bodhisattva and all the Buddhas are surrounded by large, multicolored halos, which recurred constantly at Bamian and which later were transmitted to Central Asia. Warm tones are dominant: deep cinnabar for the monastic robes of the multiple Buddhas and yellow ochre for the flesh and various details. Touches of brown and milk-white appear here and there, while the warm tones contrast with patches of fairly bright greens and blues, primarily in the background. The influence of Iran is felt at Kakrak in the diadem of cabochons and crescents worn by the bodhisattva and especially in the princely figure, called the "hunter-king," seated among the Buddhas under the arches in the lower register. This figure, probably a local princeling, is dressed in baggy trousers and boots and has a diadem with three crescents, each encompassing a white disk. Hackin compared this diadem to that on a Kushan-Sassanian coin found at Ghazni; it reappears on several bodhisattvas at Bamian and on a bejeweled Buddha depicted in the niche of the 175-ft. Buddha. The princely diadems at Kizil are similar.

The majority of the caves near the 175-ft. Buddha seem to belong to a later period (6th and even early 7th cent.) and are marked by an increase in relief decoration (Caves I and XI). Below the flattened dome are two rows of superimposed arches; those in the lower row are trefoil and correspond to the type frequently used on the stupas at Hadda and Taxila. A beautiful rinceau of leaves separates and borders the two rows; Buddhas in high relief appear under the arches, which are supported on short, squat pilasters, remnants of the Greco-Buddhist style; the Indian motif of the balustrade also is reproduced. Besides the perennial flowing vase of Mesopotamian and Assyrian origin placed above the arches, some curious grotesque masks (PL. 9), their mustaches and eyebrows treated as foliage scrolls, also would seem to be of ancient origin (masks of Luristan and the Gorgon's head); they foreshadow one of the aspects assumed by the Indian *kīrtimukha* (grotesque mask) at the beginning of the post-Gupta period, when foliage decoration was partic-

ularly prevalent (e.g., at Bhumara). The greater part of the relief decoration in the dome of Cave XI has survived intact. An elaborate network of hexagonal coffers, each containing a small seated Buddha, surrounds a central octagon with another seated Buddha. In spirit the composition is close to that at Kakrak, while this system of coffering is reminiscent of that observed in various Syrian monuments, at Dura-Europos and Baalbek in particular (ceiling of the Temple of Bacchus); subsequently, hexagons were used as decorative motifs in Sassanian art, in textiles and stuccowork of the late period (Bishapur, Ctesiphon). Hackin also found some curious heads with pointed hats in this dome at Bamian, which he compared to certain images of priests from Dura-Europos; their headdress, too, reappears on a few Sassanian coins (on the son of a king) and on the priests represented around a fire altar at Pyandzhikent. The complexity of the elements which penetrated to Bamian thus is demonstrated vividly in Sanctuaries I and XI, where Iranian motifs of widely diverse epochs mingle with motifs of Indian and even Roman west Asian origin; some perpetuate themes from the immemorial past (e.g., the vase of abundance), while others anticipate new themes (masks with mustaches and eyebrows of leaf scrolls).

The decoration in the upper part of the niche of the 175-ft. Buddha seems to have been executed during the final period of activity at Bamian. Although certain parts have disappeared completely, enough remains to give an idea of the compositional scheme and figure style. Under the arris of projection of the niche are contiguous, oval medallions containing genies and their companions, in groups of three, flying toward the Buddha to present him with flowers and garlands. High in the vault, above ornamental bands of draperies and flowers, looms a pantheon of huge seated Buddhas and bodhisattvas, encircled with multicolored halos. Here again, Iranian inspiration is conspicuous in such details as the beribboned vases, the diadems with three crescents, and the flying ribbons. A donor bearing a tray of offerings wears a long, tight-fitting tunic with revers, high boots, and a baldric holding a short dagger — an ensemble worn throughout the regions between Iran and Serindia, examples of which recur at Pyandzhikent, Kizil, and Kumtura. It is, however, the influence of Gupta India that predominates in this composition, manifesting itself in the presence of the female figures with strongly inflected posture, in the theme of the flying figures, in the predominance of Indian fashion, as exemplified by the bare torsos and gossamer draperies, and in the affectation of the hands, which are extremely elegant, expressive, and slender. The slight mannerist tendency discernible here and there is a reflection of the sensibility of Ajanta (q.v.).

The art of Bamian, founded on Greco-Buddhist traditions and subsequently permeated by elements proceeding chiefly from Sassanian Iran, evolved an Irano-Buddhist style. It assimilated and blended a variety of influences and, attaining full maturity (late 4th and 5th cent.?), revealed its truly individual character in such works as the "beautiful Bodhisattva" of Group E and the dome at Kakrak. A fresh influx of Gupta Indian influence (6th cent.?) subsequently modified the style, causing it to assume what might be described as a Sassanian-Gupta aspect, which was to be expressed in the slightly later work at Fondukistan (PLS. 4, 6, 7, 11). The art of Bamian, religious in nature, was principally concerned with the exaltation of the Buddha and the bodhisattvas; indeed, from the hieratic representation of these superhuman beings to the timeless quality of the schematic compositions with their endless repetitions, everything seems to serve this purpose. It is the predisposition toward repetition and the formalism pervading the art of Bamian which make it, if not the direct prototype, a close ancestor of subsequent manifestations of Buddhist art: the theme of the Thousand Buddhas, which first appeared in Chinese art of the Wei dynasty and reached full development in depictions on the walls and ceilings of sanctuaries in Central Asia (at Turfan and Tun-huang); the mystic diagrams, or mandalas, which spread through the esoteric Buddhism of Nepal, Tibet, and Japan. In accord with its religious purpose, Bamian's art was preeminently symbolic and decorative, seldom including anything in a picturesque or anecdotal vein; representations of donors were rare, while the vivacious aspect of the musicians in Group I, or in the niche of the Great Buddha, were absolutely exceptional. The color range employed at this site varied: the warm tones used at Kakrak reappear in some of the paintings in Group I at Bamian, while a certain ponderousness is created by the abundance of browns and greens on the domes of Groups C and D. In the main, however, light, refined color prevails; intense pink contrasts and harmonizes with bright blue, grey, and white (e.g., fresco of the "beautiful Bodhisattva"). The style and type of the figures vary considerably — a diversity due to the passage of time, no doubt, but also to the heterogeneousness of the artists who worked at Bamian.

RELATIONS BETWEEN GUPTA AND POST-GUPTA INDIA AND SASSANIAN IRAN: THE SASSANO-BUDDHIST STYLE OF FONDUKISTAN. It was apparently with the radiation of Irano-Buddhist art that elements of pose and dress, derived from Sassanian Iran, were transmitted to Central Asia. Some of these details reappear in India itself, at Ajanta. Here, however, their presence is due not to stylistic influence but to the recollection of Iranian visitors to the region. The figures in a libation scene on the ceiling of Vihara I at Ajanta exhibit the physical type and costume of Iranians and even hold Iranian objects (goblet and flask). Their heads, covered with the characteristic felt caps, are portrayed with a scrupulous attention to ethnic authenticity, giving them a slightly burlesque aspect; moreover, the masculine tunic and boots and the long feminine gown with pleated ribbons create a bulging, deformed contour which is alien to the classic Indian silhouette. This fresco at Ajanta, and another in which figures the typical Iranian, or Phrygian cap, constitute visual proof of the exchange between India and Sassanian Iran, of which the embassy sent by Khusrau to the Chalukya king of the Deccan, in the 7th century, is but one instance. It was owing to these relations that Ajanta came to exert its influence on the later paintings at Bamian and, to a marked degree, on those at Fondukistan.

Excavations carried out by Hackin in 1937 brought to light a collection of paintings and sculptures in a small monastery at Fondukistan, between Bamian and Begram. The style of these works, as well as some coins found here in funerary urns (drachma with the effigy of Khusrau II, and pieces of the Napki type, 5th–6th cent.) would seem to date the creative activity at this site in the early 7th century. The monastery had a square sanctuary with a central stupa of the usual type and deep, arched niches in the walls. The rinceaux of molded clay framing the arches are very similar to those which adorn Caves I and XI at Bamian, a fact which would indicate their proximity in time. The niches were filled with sculptures, while their walls and the wall spaces between niches were covered with paintings. The coarse material of the sculpture is the same as that used at Bamian and often in Central Asia: clay mixed with chopped straw and plant or animal fibers; a wooden armature served to support the amalgam for the head, the torso, and the arms (PL. 4). The images of the Buddha, bodhisattvas, and devata have a distinctive style, dominated by Pala Indian elements which have been somewhat exaggerated. Bussagli (1953) accurately pointed out the affinity of these sculptures produced at Fondukistan with those executed in Central Asia; the figures in the great relief carvings at Tumshuk (I, PL. 472) show a corresponding tendency toward affectation. In this case, however, the art of Serindia, hitherto constantly inspired by that of the Afghan region, influenced the work of the artists at Fondukistan; this seems to be confirmed by a comparison of the ornamental elements. The details of the diadems, for example, harmoniously assembled at Tumshuk, appear to be somewhat modified and dissociated on similar ones at Fondukistan, indicating a slightly later date for the latter (PLS. 6, 7). The facial type, with arched eyebrows, and the treatment of the hair (PL. 11), generally arranged in short, separate locks, are factors which contribute to the unusual aspect of the images on this site. A similar novel effect is achieved in the late heads of Bamian and in others found in Kashmir (chiefly at Ushkur), which again show this rising mannerist tendency. Conversely, the princely couple found in a niche comes from an entirely different sphere of influence: the tight-

fitting tunic with revers, adorned with medallions, recalls Sassanian dress and materials.

The boldly colored frescoes exhibit a similar complexity of trends. The elegance, skill, and knowledge of the human body which are manifest in a nude figure seem to derive from the frescoes at Ajanta. In a portrayal of Maitreya an essentially Indian suppleness in the pose and hands combines with a certain ponderousness of form and stolidity of the face, around which float the characteristic ribbons constantly reproduced at Bamian. The theme and details of a panel representing a solar and a lunar divinity, standing side by side, belong in quite a different category and are a reflection of the ancient cults which were perpetuated in this region. The details of the costume and attributes of these divinities are Iranian, while the lunar deity's diadem, bearing three crescents, repeats those of Bamian and Kakrak.

Before disappearing from this region, Buddhism thus stimulated the flowering of yet another distinctive style of art in a monastery at Fondukistan. Despite the fact that they too embodied elements of a widely divergent nature, the products of this art remained within the main stream of evolution which progressed from northern India and nearby Kashmir (see KASHMIR ART) to Serindia.

REFLECTIONS OF INDO-IRANIAN ART IN THE ART OF SERINDIA. This rapid review of the various styles of art that flourished successively in northwestern India and the Afghan region has demonstrated the tremendous influence of the Indo-Iranian culture, which pervaded this area throughout almost ten centuries. Echoes of it continued to reverberate through the later art of India until the advent of the Moslem era, which brought a wave of Iranian culture of an entirely different kind to bear upon the age-old traditions of India.

Symbolic and decorative motifs adopted directly from the Iranian world, or transmitted through its agency, enriched the repertory of Indian art from its first inception; indeed, its versatility is early attested by the Buddhist monuments of the 2d century B.C. (balustrades at Sanchi and Bharhut; see BUDDHIST PRIMITIVE SCHOOLS). Two esthetic ideals were thus confronted from the earliest times and throughout numerous styles. The Iranians, on the one hand, sought to impart a quality of impassive majesty and stability to their sculpture, which was in most cases dependent upon architecture; figures, whether represented in profile or fullface, were rigidly posed and had no effective volume, since they were outlined rather than modeled; the clothes appeared to be superimposed on the body, which they neither fitted nor revealed. The Indians, on the other hand, with their innate, sensual feeling for life and living things, preferred the animated pose, sought to reproduce the plastic qualities of a figure, and closely observed nature; their costume and soft, diaphanous drapery, which either exposed or suggested the body, promoted the representation of the nude. From time to time new styles were born of this constant dialogue between the eminently official and formal art of Iran and the more human and more deeply religious art of India. Such was the case at Bamian, where the Iranian and Indian esthetics were forcibly associated and their eventual compromise and fusion gave rise to a hybrid style of original aspect. This new style in turn influenced the artistic production of various localities in Serindia, to which Indian and Iranian forms, modes, and motifs often penetrated through Bamian's agency. A number of similarities already have been pointed out between the frescoes on the latter site and those at Kizil, which are nevertheless of a more episodic and picturesque nature (PL. 14). Although a certain affinity to Sassanian art noted in the art of Tumshuk does not extend much beyond the similarity of a few ornamental motifs, the association of Indian and Iranian elements and motifs is widely encountered in Serindia, notably in the frescoes executed before Chinese T'ang influence became predominant in this region, probably toward the beginning of the 8th century. The composition in the dome of Sanctuary C at Bamian was evidently the prototype for those at Kirish, Sim-Sim, Kizil, and elsewhere. The tripartite diadems with floating ribbons constantly reappear at Su-bashi, Duldur-akhur, Kizil, and Kumtura, and even figure on a Chinese stele. The familiar chaitya arch returns, though somewhat modified, while the theme of the musicians appearing at half-length on a balcony has likewise remained in vogue, together with that of the carpets hung over a balustrade (also from Bamian), which has here become a decorative motif. The tendency to treat thrones and other architectural elements as decoration began at Bamian; the bead motif used there to outline series of arches and to border medallions becomes so much *pointillé* ornamentation at Kizil. Sassanian motifs are to be seen in the rich costumes of donors and in the decoration; these include medallions bordered with bead molding and enclosing a boar's head or birds adorned with ribbons. Numerous other examples could be cited, among which are the flames issuing from the shoulders of various personages, the multicolored halos, and the enduring prestige of representations of the solar and lunar divinities. Portrayed from Kumtura to Tun-huang, these divinities are always conceived frontally, but the quadriga gradually disappears; at Kumtura only the heads and front legs of the horses are shown, while at Kizil even these are omitted. On the other hand, the deities of the wind and the flight of geese associated with the lunar deity at Bamian are repeated frequently. The analogies are not limited to theme or details, but include the invariably angular pose, the sense of form, and the technique. The ponderous flight of the genii in the Cave of the Painter at Kizil is identical to the flight of the figures at Bamian, whose faces also were to become typical in Central Asia. Rowland (1938) observed that shadows of orange pigment, as seen at Bamian, appear also in the later caves at Kizil; in fact, the coloring at the two sites is similar.

Until the diffusion of Chinese influence, in Serindia as at Bamian, color was applied in a composition for its own sake; it served neither to model form as in India, nor to emphasize particular details of a design as in China. On the contrary, a wide range of color was boldly and yet harmoniously contrasted and combined to produce a preeminently decorative effect. The Irano-Buddhist art at Bamian contained many elements which subsequently became characteristic of the art of Central Asia; indeed, there exists a definite correspondence between the art of Bamian and that of the immense region extending beyond both the Pamirs and the Oxus. Even in the frescoes on a site such as Pyandzhikent (8th cent.), which derive from a different source and produce quite another effect, certain details of costume and some of the decorative motifs betray a distant connection: the medallions bordered with bead molding; the conventional floating scarf of a harpist, whose instrument is similar to those of the musicians at Bamian. However, it was chiefly toward China that elements of Indian and Iranian origin were transmitted, with the propagation of Buddhist art and its iconography. Thus the cross-legged pose, the schematic draperies, the multicolored halos and those with flames, and the framework of beams treated as decoration are encountered in the sculpture and painting of the Wei dynasty, while a number of other Indo-Iranian motifs, including the diadems and ornaments, were transmitted in T'ang art.

Indo-Iranian art thus continued its progress toward the east, a progress extensive in time as in space. Just as the Iranian cameo representing a bearded personage holding a flower turned up at Oc Eo in Indochina alongside Indian and Chinese objects, so Indo-Iranian art eventually reached the shores of the Pacific. Henceforth, tripartite diadems and waving scarves in Japan and ornamental trees of life or vases of abundance in Java alike reflect its radiation, while even comparatively late relief carvings in Burma seem to preserve qualities reminiscent of Sassanian ornamentation.

INDO-MOSLEM SCHOOLS. This term refers to certain Islamic creations on Indian soil that differ from the great Moghul tradition. The productions of these schools reflect and embody the encounter of Islamic esthetic tradition with the more tenacious elements of Indian tradition, elements that managed to survive in the environment of the new religion. The so-called "Indo-Moslem schools" are of great interest not only because of the frequently high quality of their creations but also because, more than any other cultural phenomenon, they mark the variations and progressive adaptations of the Indian converts to Islam, who found it easy to accept the orthodox Moslem way of thinking and conception of the world. The sources of inspiration of these Indo-Moslem schools — which arose from violent conflicts and altogether disrupted the social and cultural milieu of India — are predominantly Iranian and Central Asian (Turkish). For this reason, too, the violent meeting of different traditions in a world like pre-Moghul Moslem India — a world in formation and development — is of great interest. In other cases the Indo-Moslem schools affected the development of peripheral or semiprovincial traditions, which also have an interest for the esthetic evolution of the Indian subcontinent. See INDIAN ART; ISLAM; MOGHUL SCHOOL; and TIMURID ART.

SUMMARY. General character (col. 18). The process of style development (col. 18). Earliest phases (col. 19). The art of the Delhi sultanate (col. 20). The art of the north Indian provincial sultanates (col. 23). The art of the sultanates of the Deccan (col. 26).

GENERAL CHARACTER. Indo-Moslem art is fundamentally different from and antagonistic to the Hindu and Buddhist art of India preceding it (see BUDDHISM; HINDUISM), but it is linked to it in innumerable ways: by common geographic, even ethnic, background; by the use of the same materials; by the employment of Hindu masons, painters, and other artisans; and by the infiltration of Hindu taste via Hindus converted to Islam and the Hindu women in the royal and aristocratic zenanas (women's quarters). It is basically a branch of Islamic art in its essential typology and remained faithful to the forms inherited from Iran and Turkistan during the first century of Moslem rule in India, with the cautious addition of later innovations in southwestern Asia and North Africa. The contemporaneous Hindu traditions were absorbed whenever they did not clash with the religious prejudices of the Moslems. The Indo-Moslem style developed in different ways in various parts of India, and later on these variants influenced one another.

THE PROCESS OF STYLE DEVELOPMENT. The Islamic styles which developed in the West were imported by conquerors or

immigrants. Conquerors, however, had been few: the Arabs in Sind in the early 8th century, the Ghaznevids and Ghorids in northern India about 1200, and the Great Moghuls in the 16th century. The invasions of the Mongols in the 13th–14th century, of Tamerlane in 1398–99, of Nādir Shah in 1739, and of the Afghans in the late 18th century proved to be abortive, and also created a prejudice against the civilizations of the invaders. Much more important was the influence of peaceful immigration. Most of the immigrants were military adventurers not interested in art, and the importation of new Persian, Turkish, and Egyptian (Ayyubid and Mameluke) ideals of art was the work of a handful of highly cultured statesmen of foreign extraction. Art was also used as a means of social distinction when the subject Hindus had succeeded too well in imitating their masters. The Indians themselves did not wish to imitate Islamic art too closely, for this would have been an admission of provincial inferiority, and hardly any Indian sultan or emperor would have been prepared to acknowledge such an inferior cultural status.

The situation was different with regard to the influence of Hindu art on the conquerors. The Moslems formed a diminutive ruling class of soldiers, with a sprinkling of scholars and religious teachers. They were forced to rely on indigenous labor. Good artists from other Moslem countries would be attracted by any successful ruler, especially if he showed a real appreciation of their work. But an ambitious ruler would want numerous, grandiose, and costly fortresses, palaces, mosques, furniture, apparel, illustrated manuscripts, etc., and the most the few Moslem artists could do was to provide general designs and supervise their execution by Hindu artisans. The latter were highly skilled and brought a great tradition of their own. It was inevitable that most minor details would be left to them, so long as they avoided whatever might appear idolatrous or obscene to the Moslem planners: anthropomorphous figures, and especially representations of deities and nude women.

As both the Hindu and Moslem regimes were more or less theocratic, every conquest required the destruction of the royal temples of the overthrown Hindu dynasties, the temples of other Indian rallying centers, and the great places of pilgrimage and the erection of mosques, symbols of victory which also served the religious needs of the Moslem garrisons. The successive conquests were so sweeping that at first there was no time for extensive building programs. The pillars, doors, beams, and ceilings of the destroyed temples were rearranged into mosques after the most objectionable sculptures had been eliminated. From using Hindu spoils to the conscious introduction of Hindu motifs into Indo-Moslem art was but a step.

Another channel of Hindu art was the great zenanas, with their many Hindu ladies only superficially converted to Islam and faithful to their native costumes, jewelry, and articles of daily use. Even when these women adopted Islamic fashions, there were still the maidservants, singing and dancing girls, jesters, and astrologers who did not. This unobtrusive but lasting influence became stronger when relations with the Hindus were peaceful; when there was war, the differences became accentuated. Eventually not only the exterior aspects but also the spirit of the arts of the two cultures mingled and fused into a new entity.

EARLIEST PHASES. A distinct Indo-Moslem style did not develop until the foundation of the Mameluke sultanate of Delhi about the beginning of the 13th century. However, Arab art of the Abbasside caliphate (see ABBASSIDE ART) had maintained a foothold in Sind since the 8th century, especially at its capital, Brahmanabad. Remnants of fortifications, a mosque, ivory "chessmen" (parts of a piece of furniture), and potsherds recall the finds at Samarra. Abbasside ornaments survived in the Hindu art tradition, for example, in the "Ghazni throne" of the rajas of Pugal and in the Hirmā Devī temple of Manali (16th cent.).

The capital of the Ghaznevid empire (see GHAZNEVID ART), which comprised Afghanistan, Sind, and the Punjab (10th–12th cent.), was Ghazni. The only remaining monuments are the tombs of Maḥmūd (998–1030) and of Ibrāhīm (1059–99), the minarets of Mas'ūd III (1099–1115) and of Bahrām Shah (1117–53), the ruins of the Gōsha-i Mas'ūdī palace, and some tombs, all in a style related to Samanid-Seljuk art (see SELJUK ART). The door of Maḥmūd's tomb (now at Agra), which is supposed to have been part of Maḥmūd's loot from the Somnath temple in Saurashtra, is in the best Samanid tradition. Ghazni, however, reveals the hand of Hindu masons, and the murals of the palace of Lashkari Bazaar anticipate many characteristics of Rajput painting in India (see RAJPUT SCHOOL). Early Rajput applied art has often proved to be a late echo of the Seljuk-Ghaznevid tradition.

THE ART OF THE DELHI SULTANATE. The first mosque was the Quwwat-ul-Islām at Lalkot, begun in 1193 by expanding the court of a former Jain temple with the spoils from other Hindu shrines and adding a Seljuk façade where pure Hindu flower arabesques form the background for quotations in Arabic from the Koran. Beside it is a huge tower of victory, begun in 1199, the world-famous Quṭb Minār (PLS. 15, 164). The Ghorid minaret of Jam (Iran) is a copy of it. The first three stories of the Quṭb Minār are of tapering tent shape, fluted, with projecting balconies resting on beautiful *muqarna* (stalactite) niches, and attractive friezes of inscriptions from the Koran, Islamic arabesques, and Hindu ornaments. Another mosque, the Arhai-dīn-kā-Jhōnpṛa, was erected in 1200 at Ajmer, with a rich screen of trefoil and five-scalloped arches and fluted buttresses at the corners. Sultan Īltutmish (1211–36) expanded the Quwwat-ul-Islām in 1230; the screen here does not have Hindu ornamentation. Īltutmish also completed the Quṭb Minār, but the top two stories had to be rebuilt by Fīrūz Shāh III Tughlaq in 1368. The top was renovated in 1503 and 1828; at present the tower is 238 ft. high. Īltutmish also built a mosque at Budaun in 1223, of rather heavy proportions. His tomb, behind the Quwwat-ul-Islām, is cubic in form and was once covered by a dome; inside it is decorated with remarkable Hindu-Islamic arabesques. The oldest mausoleum, of 1231, is that of his eldest son at Mahipalpur (4 mi. southwest), an underground chamber (therefore called "Sultān Ghārī") of Hindu spoils embedded in the flooring of a fortified court of simple Hindu colonnades, with marble mihrab and entrance.

Of the still surviving buildings of the later Mameluke sultans, the most important ones are those erected under Balban: the heavily renovated mausoleums of the saints Bahā-ud-Dīn Zaqariā (1262) and Shams-ud-Dīn Tabrīzī (1276), both at Multan, the small mosque at Jalali, and the badly damaged mausoleum of Balban (1266–87) at Mahrauli. The famous palaces of that time — Daulat Khāna, Kōshak-i Safīd, Kōshak-i Lāl, and Kilokheri — no longer exist, having been used as quarries by later rulers. The vast figural murals in the palace of Kilokheri, erected by Kai-Kūbād (1287–90), were later destroyed by Fīrūz Shāh III Tughlaq.

Under the Khiljī (1290–1320) and Tughlaq (1320–1414) dynasties Indo-Moslem art at last broke away from the Seljuk tradition. The defence against the Mongols of Persia, the setting up of a highly efficient war machine, and the conquest of almost the whole of India inspired an art of megalomaniac dimensions, pronouncedly military, and of increasingly Indian character. A'lā-ud-Dīn (1296–1316) laid out a new town, Siri (1313), northeast of Lalkot. His plan to expand the Quwwat-ul-Islām mosque to three times its size never proceeded beyond the foundations, and the A'lāī Minār, intended to reach a height of almost 500 ft., reached only the first turn of its winding staircase. Only the south arcade with its entrance, the A'lāī Darwāza, was completed. It is a cube with a low dome, four doorways, genuine and blind windows, red sandstone walls carved with Islamic and Hindu ornaments, panels of white, yellow, and black marble or of bluish schist, flowering cusped arches, Hindu flower-garland arches, and pillars. A'lā-ud-Dīn's son Khiẓr Khan erected a mausoleum of the same type for the saint Niẓām-ud-Dīn Auliyā; under Fīrūz Shāh III Tughlaq this was transformed into a congregation hall (Jam'at Khāna) by the addition of two similar wings. Most provincial buildings of this time are crude constructions from Hindu spoils; only

a few are of artistic interest, such as the mosques at Anhilwara (mod. Patan; 1305), Cambay (1314), and Broach in Gujarat and the one at Daulatabad (1315) in the Deccan.

Ghiyās-ud-Dīn Tughlaq (1320–25) inaugurated the pure military style in the fortress, palace, and mausoleum of Tughlakabad (5 mi. east of Lalkot); his son Muḥammad ibn-Tughlaq built the fort at Adilabad to protect the dam of the artificial lake which provided the fortress and its moat with water. The mighty fortifications encircle a hillock 65 to 98 ft. high. In the lower citadel there are still ruins of a vast palace. South of it, connected by a dyke, the mausoleum of Ghiyās-ud-Dīn Tughlaq stands in the midst of a small but strong fort. Like the walls and bastions, it has sloping walls of red sandstone, sparsely decorated with sculptured ornaments, deriving its esthetic effect mainly from the color contrast of the panel friezes of white and black marble. In its circumvallation, halls of pure Hindu character with Hindu pillars, lintel beams, and eaves of sandstone slabs have been inserted. Ghiyās-ud-Dīn Tughlaq also built the mausoleum of Rukn-i ʿĀlam at Multan, of octagonal ground plan and sloping corner buttresses.

Muḥammad ibn-Tughlaq (1325–51) moved the capital in 1327 to Deogiri (mod. Daulatabad) in the northern Deccan, in order to control the north and south from this immensely strong fortress (on an extinguished volcano) near the most important passes. Returning to Delhi in 1332, he connected Lalkot and Siri by the town of Jahanpanah, where he built a palace, the Bijai Mandal. This very strong private palace, consisting of a zenana on the top floor, ascending zigzag passages for palanquins, and some garden pavilions of simple massive forms, once probably painted in gorgeous colors, still exists; all that is left of the audience hall of huge wooden pillars, called Chihīl Sutūn (Forty Pillars) or Hazār Sutūn (Thousand Pillars), is the flooring.

Muḥammad's pious successor Fīrūz Shāh III Tughlaq (1351–88), who salvaged at least northern India from the chaos created by the megalomania of his uncle, was a great builder, founder, and resettler of many towns and village colonies, such as Jaunpur, Shahpur, Hissar, and Dholka. He surrounded Delhi with many garden palaces and hunting lodges, such as the Kotila-i Fīrūz Shah, Hauz-i Khās, Boli Bakhtiyāri-kā Mahal, and Kōshak-i Shikār. They are cheaply built of rubble, roughly cut stones, and mortar, and covered with plaster, once, however, nicely painted; their forms are more elegant, rich, and involved than under Fīrūz Shah's predecessors. Persian (Timurid) influence makes itself felt alongside more Hindu forms; inscription friezes and ornaments of carved stucco are rare. The most interesting palaces are those of the Kotila and the Hauz-i Khās. The first is a summer palace, the main buildings of which — a Hawā Mahal (wind-exposed step pyramid of halls and terraces), a mosque (PL. 16), and a zenana — skirt the banks of the Jamuna River; a garden with a well surrounded by cool underground chambers, a reception hall, offices, and the barracks of the guards are situated near the strong entrance gate. The Hauz-i Khās is a palace on the banks of an artificial lake (west of Siri), with its southwestern corner flanked by two wings of domed halls and open colonnades, behind which gardens and courts housed the royal ladies. Fīrūz Shah was buried in the principal hall, and the garden pavilions were later given over to professors and students of theology. Fīrūz Shah built no mosques at Delhi, but he did build several dargahs (places of pilgrimage around the tombs of saints): at Mahrauli (south of Lalkot) that of Quṭb-ud-Dīn Bakhtiyār Kākī (1355); at Nizam-ud-Din a new tomb (later rebuilt) for the great Auliyā saint, Niẓām-ud-Dīn, altering the older one into a congregation hall; at Siri that of Roshān Chirāgh-i Delhī (1374); and at Paharganj (near the present New Delhi station) the Qadam-i Sharīf, a small shrine for a relic of the prophet Mohammed inside a strong fort.

The three Delhi mosques of his reign were built by his prime ministers, Khan Jahān Tēlingānī and his son Khan Jahān Jūnān Shah. That at Nizam-ud-Din (1370/71) has four courts separated by colonnades; that at Begampur (PL. 17) is a huge structure raised on a high platform, with a Persian aiwan (vaulted hall) behind the main entrance, an arched pylon in front of the *maqṣura* (hall in front of the principal mihrab), and a charming ladies' mosque; the small Kalā(n) Masjid (near the Turkoman Gate) stands on a high substructure of shops, the rent from which once served for its maintenance. Other buildings of the time are at Dholka and Mangrol in Gujarat, Sarhind in the Punjab, and the Bihār-i Sharīf.

From then on, monuments were erected by the nobles who set up or overthrew the last Tughlaqs, or who became practically independent in the provinces, for example, the Lāl Gumbad and Kharēra Īdgāh at Delhi, the mosques and tombs of the Khanzāda amirs of Mewat, the Jilvānī-Auhadīs of Bayana, the Dandānīs of Nagaur, and the Malikshāhs of Kalpi in Bundelkhand. Echoes of the Tughlaq style survive in the architecture of the sultanates of Jaunpur, Malwa, Gujarat, and the Deccan.

The Sayyid dynasty (1414–51) and originally also the Lōdī dynasty of Delhi (1451–1526) had started as vassals of the Timurids of Central Asia in Delhi and the Punjab. They broke with the Tughlaq art tradition, again building mosques and tombs with vertical walls and high domes, sometimes also with heavy, but no longer tapering, buttresses. They decorated them with purely Central Asian inscriptions and arabesque friezes of deeply carved and painted stucco, enriched by an admixture of encaustic tiles, niches, and battlements of irregular shapes. The type of mausoleum that Khan Jahān Tēlingānī had first introduced in 1372 now became the rule: it consisted of an octagonal ground plan, surrounded by an open colonnade covered inside by fluted domes and outside crowned by small *chattrī*s (Hindu pavilions) of broad eaves and high domes resting on slim pillars. Hindu pillar bases and capitals, brackets, lintels, eaves, balconies, and *chattrī*s now became an integral part of most buildings. The edifices of the Sayyid dynasty are confined to Delhi (the township of Mubarakpur) and the tombs at Khairpur (now Lodi Gardens) as well as Mubarakpur. The Lōdīs, who annexed the kingdom of Jaunpur up to the frontier of Bengal and north-central India, have left a considerable number of monuments. Those in the Delhi area include the mausoleum of Sikandar Lōdī (PL. 16); the small, beautifully decorated Lōdī Mosque at Khairpur, built by Abū-Amjad in 1494; the Mōth-kā Masjid at Siri (PL. 18); and other buildings at Mahrauli and Siri. In Sarhind, Sikandra, Agra (two Lōdī foundations), Bayana, Dholpur, and Sambhal are other buildings of the Lōdīs.

The Lōdī style survived the first conquest of northern India by the Moghul emperors Bāber (1526–30) and Humāyūn (1530–40), as seen especially in the Jamālī Masjid and the small, beautiful mausoleum of Maulānā Jamāl Khan at Mahrauli (PL. 18). It experienced a splendid revival under the Pathan emperors of the Sūr dynasty (1540–54) before it was incorporated into Moghul architecture between 1554 and 1575. Shēr Shah (1540–45) not only built many towns and fortresses, such as Patna, Rohtas in Bihar, Kanauj, Shergarh, and Rohtas in the Punjab, but also erected fine buildings in Monghyr, Patna, Chainpur, Sasaram, Rajgarh, and Merta. Best known are his imperial citadel Purana Qila at Delhi, with the grandiose Qila-i Kohna Masjid (PL. 18) and the gates (e.g., the Lāl Darwāza) of the town connected with it (PL. 19); and his own grandiose mausoleum and the tombs of his family at Sasaram and Chainpur in Bihar. They represent a synthesis of all the achievements of the preceding Moslem dynasties of northern India. The mighty walls and huge bastions of Purana Qila are decorated outside with slabs of red and yellow sandstone and white and black marble (as in Tughlaq times) and with the Sūr coat of arms (Solomon's seal); within, the fort has Lōdī friezes of richly cut stucco. The Qila-i Kohna Masjid, near the old riverside, is a large-scale repetition of the (Sayyid) Muḥammadī Mosque (PL. 17) and the (Lōdī) Mōth-kā Masjid, both at Siri, and of the Jamālī Masjid at Mahrauli. Its decoration is a mixture of styles: Hindu pillars, brackets, and lotus ceilings; Khiljī arches and panels; Tughlaq multicolored stone intarsia; Lōdī inscriptions and arabesques; Central Asian encaustic tile friezes; and Mameluke marble mosaic, probably introduced by Egyptian emigrees after the fall of the Mameluke empire in 1517. Shēr Shah's mausoleum at Sasaram, a huge dome resting on an octagon surrounded by open colonnades, is on a platform in

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

the center of an artificial lake which is reached by a causeway; at one time the great emperor's tomb was richly embellished with green, yellow, and blue glazed tiles. The mausoleum of his successor Islām (Salīm) Shah at Sasaram was never completed. The tombs of Shēr Shah's relatives at Chainpur are much simpler. Of later Sūr buildings the tomb and mosque of 'Īsā Khan (1547) near Nizam-ud-Din (Delhi) and the tomb of the governor Fatḥ Jang (1547) at Alwar are best known. The former is of the octagonal type, in the center of an octagonal fortified garden; the latter is a domed cube surrounded by two stories of open galleries, covered by fluted cupola ceilings.

The Moghul emperors (after 1526, and more precisely from Akbar's reign, 1556–1605) introduced the Timurid art of Turkistan and the Safavid style of Persia that derived from it. But like the earlier conquerors of India they were soon forced to employ indigenous architects, masons, and painters. The earliest example of Sūr architecture for the Moghuls is the Rām (originally Ārām) Bāgh at Agra, the next the tomb of Adham Khan at Mahrauli (1562). The decoration of white (and also black) marble panels on red sandstone walls was soon adopted, as in Delhi in the Arab Serai, 1561; the Khair-ul-Manāzil Madrasah, 1561–62 (X, PL. 109); and the mausoleum of the emperor Humāyūn, ca. 1568–80 (X, PL. 111). The mosaic of Shēr Shah's Qila-i Kohna Masjid recurs in part of the decoration of the exquisite tomb of Ataga Khan at Delhi (d. 1562; PL. 89) and in the *maqṣūra* of the Great Mosque (1571–80) at Fatehpur Sikri. Thereafter the Lōdī-Sūr style was integrated into the eclectic Moghul art of the late 16th and early 17th centuries, as were all the Islamic and northern Hindu styles of the time.

Of painting and the minor arts under the Delhi sultanate very little is known. The *History of Fīruz Shāh* mentions that the pious emperor had figural paintings removed from the walls and doors of the Delhi palaces, but nothing is preserved. The so-called "Kanauj throne" of the Bikaner maharajas, with its many carved wooden panels, may be regarded as the sole piece so far known of 15th-century furniture (V, PL. 458). Encaustic tiles and potsherds have been excavated at Adilabad. There is a brass aquamanile in Boston (Mus. of Fine Arts) and a lion tapestry (14th cent.?) in Ahmadabad (Calico Mus. of Textiles).

THE ART OF THE NORTH INDIAN PROVINCIAL SULTANATES. Kashmir, a Moslem state from 1339, had never been subject to Delhi. Bengal and the Deccan had become independent under Muḥammad ibn-Tughlaq in 1345–46; after the sack of Delhi by Tamerlane in 1398, Jaunpur, Malwa, and Gujarat also became independent sultanates. These sultanates, antagonistic to Delhi and closely linked with the traditions of their respective provinces, cultivated local art styles.

This was not so pronounced in the case of Delhi's most dangerous adversary, the Sharqī sultanate of Jaunpur (1394–1479), which ruled over the Ganges plains between Delhi and Bengal. Most of its monuments are found at Jaunpur (northwest of Benares) with its strong citadel, the Ātala Masjid (PL. 19); the huge Jāmi' Masjid (1438–48, enlarged 1478); and the Lāl Darwāza Masjid (ca. 1457), built by the queen Bībī Rājī near the royal palace of the same name, which no longer exists. Although Hindu spoils were extensively used in these mosques, they represent a further development of the mosque of Khan Jahān Jūnān Shah at Begampur; the Timurid aiwans and arched pylons dominate the buildings; in the ornamentation Khiljī motifs (especially floral scallops along the arches) interpreted in a "baroque" spirit and mosaic of innumerable small encaustic tile cubes are characteristic.

The architecture of Malwa is much more complex. It too derived from the late Tughlaq tradition, but here vertical walls of yellow limestone, even of white marble, were retained, as well as some Khiljī decorative motifs; to this were added many elements from other architectural styles: contemporary Persian (especially huge aiwans, high hemispherical domes, corner turrets, etc.), Mameluke (columns, "Gothic" arches), and Rajput (projecting eaves, perforated stone screens, pillars, and lintels). The chief centers are Dhar and Mandu in south Malwa and Chanderi in north Malwa. In Dhar, the first capital of Malwa, the Lāt Masjid, which enclosed a Hindu iron column, was erected from Hindu spoils by Dilāwar Khan (1392–1406). Mandu, the later capital, was founded on an almost inaccessible spur of the Vindhyas by Hōshang (1406–35), the actual creator of the Malwa style; he also founded Chanderi at the foot of a former Rajput hill fort. Other Malwa monuments are found at Udaipur, Singhapur, Ujjain, Kalyada, Mandasor, and Narsinghgarh. Examples of the earlier, simple style of Hōshang are his mausoleum of white marble, the Old Palace, mosque of Malik Mughīs ud-Dunyā (1432), Hindōla Mahal (audience hall with Tughlaq tapering buttresses), and Delhi Gate (1411), all at Mandu, and the Jāmi' Masjid at Chanderi. The classic style of Maḥmūd I (1435–69) is seen at Mandu in the Ashrafī Mahal (madrasah, tomb, and tower of victory, of which little remains), great audience hall ("Gadā Shah's Shop"), Northern Palace (Egyptian influence), and Jahāz Mahal (zenana); at Chanderi, in the Kōshak Mahal and Shāhzādī-kā Rauza. The Jāmi' Masjid (on a high platform) at Mandu was begun by Hōshang and completed by Maḥmūd I. Examples of the late, ornate style under Ghiyās-ud-Dīn (1469–1500), Nāṣir-ud-Dīn (1500–11), and Maḥmūd II (1511–31) are the vast zenana town, Lāl Mahal, Chappan Mahal, Palace of Bāz Bahādur and Rūpmatī's Pavilion, "Gadā Shah's House" (with the only surviving murals), all at Mandu, and the various mosques and palaces in other places, especially the Jal Mahal (water palace) at Kalyada near Ujjain. A Moghul echo of the Malwa style is the mausoleum of the saint Muḥammad Ghaus at Gwalior (1563). Recently two illustrated manuscripts have been discovered, the *Ni'mat-nāma* of Ghiyās-ud-Dīn (London, India Office Lib.) and the *Būstān* of Nāṣir Shāh Khiljī (New Delhi, Nat. Lib.).

The architecture of Gujarat, Bengal, and Kashmir, however, evolved from Hindu prototypes. In the Gujarat sultanate (1401–1573) pure Islamic architecture was confined to buildings in brick and plaster, such as the mausoleum of 'Azam and Mu'azzam at Sarkhej, near Ahmadabad (1457), the gigantic mausoleum of Daryā Khan (1453) at Ahmadabad, an unknown tomb at Champaner, and the palace of Maḥmūd III (1538–54) at Mehmadabad. Otherwise Hindu architecture (first used as spoils) was adapted, because excellent Hindu masons were available in great number. Hindu shrines, placed atop one another, became minarets; Hindu cult halls, set side by side, became the naves of mosques; the entrances of Hindu sanctuaries became mihrab niches. Only the ogival arches (or at least the central arch) of the mosque façade follow a purely Islamic pattern, the transition to the much lower nave of Hindu columns and corbeled ceilings behind them being achieved by means of an upper story of balconies and open galleries. All Hindu forms and ornaments were retained, though purified of idolatrous figures and enriched by Islamic arabesques and Arab inscriptions.

In principle the style of Gujarat had already been anticipated in the Khiljī and Tughlaq mosques at Anhilwara, Sidhpur, Cambay, Broach, Dholka, and Mangrol, but it assumed definitive shape under Aḥmad I (1411–41), founder of the new capital Ahmadabad and of Himatnagar (mod. Ahmadnagar in Gujarat). The early, simple style is exemplified in Ahmadabad by the mosque of Aḥmad I (1414; constructed partly of Hindu spoils) within the Bhadr, or royal fort; the mosques of the Rani (in the Mirzapur quarter), Sayyid 'Ālam, and Haibat Khan, all of 1412; the Jāmi' Masjid (1423/24); and the Tīn Darwāza, or Triple Gateway (ca. 1425), of the palace square. Aḥmad I also built a mosque in Himatnagar. Representative of the transitional style under Muḥammad II (1448–51) and Quṭb-ud-Dīn Aḥmad II (1451–58) in or near Ahmadabad are the mausoleum of Aḥmad I; the Tombs of the Queens (Rānī-kā Hujrā, ca. 1440); the mosques of Quṭb-ud-Dīn (ca. 1450) and Malik 'Ālam (ca. 1450–60); the tombs (and mosques) of Shakar Khan (1450), Sheik Aḥmad Khatri (1446–51; at Sarkhej), Malik Sha'bān (1452/56), and Sheik Burhān-ud-Dīn (at Batwa); and Kankariya Lake. There were two types of mosque, one with ogival arches, the other with Hindu pillars and lintels; ornaments were still sparsely used and had not yet become stereotyped.

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

The classic style flourished under Maḥmūd Bēgadā (1458–1511) and Muẓaffar II (1511–26). Maḥmūd Bēgadā expanded Ahmadabad, founded the second capital Champaner (1482/84) at the foot of the former Rajput mountain fortress of Pawagarh, and founded or rebuilt Mehmadabad, Baroda, Mustafabad (now Junagarh), and Jalor. In Ahmadabad are the mosques of Dastūr Khan (1486), Muhāfiz Khan (1492), and Bābā Lulū'ī, the Gumti Masjid (ca. 1510; in the Isanpur quarter), the mausoleums of Sīdī 'Usmān (1460; in the Usmanpur quarter), Bībī Achyut Kūkī (1472), and Shah 'Ālam (1475), and the step-well of Bāi Harī (1500). Another well of 1500 is in Adalaj. Other buildings of this period are the royal palaces and lake at Sarkhej; the sluices of Kankariya Lake; at Champaner the Jahānpanāh citadel with ruins of royal palaces, Jāmi' Masjid (1508/09), Nīla Gumbaz, several tombs, the Sat Manzil, and a hunting lodge perched at the top of a deep gorge halfway up to Pawagarh; the Kevadā and Halol mosques; at Mehmadabad the Bhamaria well (with underground chambers) and the mausoleum of Mubārak Sayyid (1484); at Jalor the Tōpkhāna Masjid. The architecture during this time was well balanced, its conception grand, its ornamentation rich but not yet exuberant; after about 1500, however, it became increasingly rich and elegant and was finally smothered in a wealth of decoration. The most famous examples of this elaborate style are the tombs of Rani Rūpvatī (1500) and Rani Siparī (1514) at Ahmadabad and the mausoleum of the Nagīna Masjid at Champaner. To the late, degenerating style (1526–97) belong the mausoleum of Sultan Sikandar at Halol (1526) and the following buildings at Ahmadabad: mosques in the Sarangpur quarter (1528), of Shah Khūb Sayyid (1538), Sīdī Sayyid (1572; PL. 19), and Muḥammad Ghaus (1562); and the mausoleums of Sheik Ḥasan Muḥammad Chishtī (1566) in the Shahpur quarter and Abū-Turāb (1597). The Khan Sarovar (artificial lake; 1589–94) at Anhilwara is another example of the late style and was constructed under Moghul rule as was the mausoleum of Sheik Salīm Chishtī at Fatehpur Sikri (1571–80).

Gujurat painting, which we know only from a few original miniatures, remnants of murals at Champaner (since destroyed), copies in contemporaneous Jain manuscripts (mainly the *Kālākācāryakathā*), and echoes in a 16th/17th-century manuscript from Marwar, seems to have been a late offshoot of the "Baghdad" school, possibly via Delhi. Glazed and unglazed pottery has been discovered in Baroda and other places, and printed textiles have been excavated in Egypt.

Architecture under the Bengal sultanate (1287/1345–1576) also developed from Hindu art, but from brick prototypes and not limestone. Stone had to be brought by boat from the quarries of Rajmahal, where the Ganges skirts the easternmost spurs of the central Indian mountain ranges. Massive brick walls decorated with delicate reliefs of intricate Hindu ornaments (generally leaf scrolls) or with richly carved inserted stone slabs and *bangaldār* (curved) roofs (inspired by the bamboo roofs of the local village huts) are the characteristics of this art. Its centers were Gaur at the head of the Ganges Delta, capital of Bengal in 1211–1354 and 1442–1576, and, in the interior, Pandua (14 mi. to the north), both vast cities surrounded by broad moats and high dikes. The only remnants of the first Gaur period are the Seljuk mihrab of the mausoleum of Zafar Khān Ghāzī (rebuilt 1493–1518) at Tribeni (Hooghly district) and the Sālik Mosque at Basirhat (1305). At Pandua Sikandar Shah (1358–89) built the gigantic Adīna Masjid, and Jalāl-ud-Dīn Muḥammad (1414–31) built the Eklākhī Mosque in classic style.

Most monuments at Gaur belong to the second period. Nāṣir-ud-Dīn Muḥammad (1442–59) restored the town, erected the tomb of A'lā-ul-Haq at Pandua, the mosque at Satgaon, and the Sāth Gumbaz Masjid at Bagerhat (1459, echoes of Tughlaq style); Rukn-ud-Dīn Bārbak (1459–74) built the imposing Dakhil Darwāza (palace entrance) in Gaur. After Yūsuf Shah (1474–81), Bengalese art became mannered and effeminate (Tāntipāra, Daras Bārī, Nattan, Chamkhan, and Gunmant mosques, all in Gaur). The mosques of Bābā Ādam Shahīd at Vikrampur (1483) and of Muẓaffar Shah (1490–93) at Kusumbha and the Fīrūz Mīnār at Gaur (1486) show how the style became progressively decadent, ending in empty repetition. However, in the 16th century there was a renaissance, overelaborate and flamboyant, as seen in the Choṭā Sonā (Little Golden) Masjid (1493–1518) and Barā Sonā (Great Golden) Masjid (1526) — the two best-known Moslem buildings in Bengal — and the tomb of Ākhī Sirāj-ud-Dīn (1510), all at Gaur; the mosques of Bara Goali, Tribeni, and Masjidkur (1493–1518), Malda (1533–38, 1566), and Bhaga (1523/24); and finally the Sonā Masjid of Pandua (1585). The only painting we know is a portrait of Sultan A'lā-ud-Dīn Fīrūz Shah (1532), attributed to the school of the Persian master Bihzād. The Gaur-Pandua style (lotus columns, *bangaldār* roofs) first influenced Moghul architecture during the reign of Shah Jahān (1628–58), who had been governor of Bengal before he became emperor.

In Kashmir the Hindu-Buddhist background was still different. There were few Hindu ruins of the 8th–10th century, and a living tradition of indigenous wood and imported Persian brick and tile architecture persisted (see KASHMIR ART). Some Hindu temple ruins were transformed into tombs, such as the ziara of Bumazuv on the road to Pahlgam; the shrine of Mādīn Shah near Srinagar, simply a temple ruin roofed in; and especially the mausoleum of the mother of Sultan Zain-ul-'Ābidīn (1417–67) in Srinagar, a brick construction (decorated with encaustic tiles randomly spaced) with a high dome and supplementary turrets, which rests on Hindu foundations. Other mosques (e.g., at Pampur) and ziaras (the most famous one that of Shah Hāmadān in Srinagar) are huge blockhouses with a sod-covered sloping roof and a curious *ma'zīna* (low minaret) ending in a spire; probably they are adaptations of a late type of Buddhist temple, crowned by a *chattrāvalī*, such as is still found in Tibet (though without the latter). In the Jāmi' Masjid of Srinagar, originally founded by Sikandar Būtshikān (1390–1416), these spired blockhouses form the four aiwans of a mosque of Persian ground plan. Almost all these wooden constructions had burned down and been rebuilt time and again; except for minor details they retained the original design.

THE ART OF THE SULTANATES OF THE DECCAN. In the southern Deccan, the area farthest away from Delhi, the Hindus had recovered from their defeat by the Khiljī and Tughlaq sultans and rallied under the Rāyas of Vijayanagar. The Bahmanī sultans of the northern Deccan (1347–ca. 1528), who were equally antagonistic to Delhi, nevertheless regarded Vijayanagar as their principal enemy. In search of a style of their own, they adopted contemporary Persian art, but the influence of the Indian milieu — through the royal and aristocratic zenanas, Hindu converts to Islam, Hindu vassals and mercenaries, courtesans, and artisans — resulted in a strong admixture of Hindu motifs, especially in secular architecture and the minor arts. (See DECCAN ART.) The Bahmanī sultans strengthened their hold over the country by a net of mighty fortresses built according to the most modern methods evolved in southwestern Asia during the Crusades.

Zafar Khān Ghāzī (1347–58) moved the capital to the center of the new kingdom, Gulbarga. The earliest buildings still followed the Tughlaq style, but Muḥammad I (1358–75), who first gave to the state its characteristic organization, introduced the Persian style in the Jāmi' Masjid, which was built by a Persian architect from Qazvin. It is one of the very few mosques in India without court or minarets and has an open hall covered by 68 domes surrounded by vaults, all resting on broad keel arches supported by low piers. The royal tombs to the east and west of Gulbarga are of pure Ilkhan type (see ILKHAN ART): cubes decorated with two stories of blind keel-arch niches and crowned by a hemispherical dome flanked by four turrets. During the rule of the tolerant Fīrūz Shah (1397–1422) Hindu motifs (among them the Deccan coat of arms, a lion holding diminutive elephants in his claws) began to infiltrate. Fīrūz Shah built a summer residence at Firozabad on the Bhima River. Aḥmad I Wālī (1422–36) transferred the capital to Bidar in 1428, but it was not completed until 1532. In Bidar, which is partly surrounded by a triple moat cut into the rock, the Persian taste dominated, as is evidenced in buildings covered with brightly painted encaustic tiles: the Takht Mahal, Shāh

Burj, Lāl Bāgh, Sōla Khumba Masjid, and the later series of royal tombs at Ashtur. During the reign of Aḥmad I the mausoleum of the saint Banda Nawāz (Gēsū Darāz) was built at Gulbarga; the huge freestanding arch, six stories high, was added later by Aḥmad III.

Aḥmad II (1436–58) built a madrasah with a Takht-i Kirmānī (hall for Shiite festivals) in Bidar, the garden palace of Ni'matabad (now destroyed), and the Chānd Minār at Daulatabad (1436), a slim tower encircled by broad balconies. Under Aḥmad III (1461–63) and Muḥammad III (1463–82) the Gagan, Tarkash, Chīnī, and Nagīna mahals were added to the royal palace at Bidar; these represent the zenith of Bahmanī art. The actual power at this time was in the hands of the prime ministers, the most important of whom, Maḥmūd Gāwān (1466–81), built the great madrasah (1472), of purely Persian style, in Bidar. To the period of decadence belong the buildings erected at Bidar under Maḥmūd (1482–1518), a powerless tool in the hands of his quarreling nobles: the Sharza Darwāza (with tile pictures of the sun behind a lion rampant), the New Palace, and the Rangīn Mahal, which is richly decorated with walls of encaustic tiles, Hindu carved wooden pillars and ceiling, and door frames incrusted with mother-of-pearl.

Some illustrated manuscripts of late Bahmanī times have been traced but are not yet published. These reveal the same mixture of an essentially Persian art with some Hindu influences. Minor arts are so far known only from literary references.

During Maḥmūd's reign the Bahmanī empire broke up into the five sultanates of Bidad, Berar, Ahmadnagar, Bijapur, and Golconda. To these must be added the principality of Khandesh, which had been independent since 1382/88.

The art of the Fārūqī dynasty of Khandesh (1382/88–1600) was dependent on the neighboring areas of Gujarat, Malwa, and the Deccan. The principal stronghold of the Fārūqīs was the mountain fortress of Asirgarh, and their capital was Burhanpur; however, several princes were buried at Thalner on the Tapti River, the original family fief. In Burhanpur (1400/01) are the Jāmi' Masjid (by Raja 'Alī Khan), the Bībī Masjid, and the mausoleum of Nādir Shah (Nāṣir Khan, 1399–1457). At Thalner the mausoleum of Mīrān Mubārak I (1441–57) is remarkable for its beauty. The Barā Darwāza at Chikalda has a huge arch like that of the Banda Nawāz shrine at Gulbarga.

The art of the Niẓāmshāhs of Ahmadnagar (1490–1633) was also rather eclectic but with a stronger Deccan accent. Like the Bahmanīs, they built many fortresses, though mainly as a protection against the Moghuls. Their first capital, Ahmadnagar (founded ca. 1490 by Aḥmad Niẓāmshāh Bahrī), was one of the finest works of military engineering in India; because it was subjected to many sieges, it is badly damaged. The best buildings are the Dāmarī Masjid, in a mixed Deccan-Gujarat style, and, outside the Fort, the tomb of Salābat Khan and the Fāriā (Pērī) Bāgh, both in the Moghul style. The second capital, Daulatabad (the former Deogirī), has two sets of Niẓāmshāhī palaces on the terrace of the Lower Fort, between the rock-cut moat surrounding the old Hindu Deogiri and the town (PL. 20). The palace proper is rather small, as befits the powerless boy kings kept there by Negro and Marāṭhā regents; the Chīnī Mahal, which is an imitation of the Hindōla Mahal at Mandu, was once completely covered with brightly colored encaustic tiles. The town Khirki (which later became the Moghul capital Aurangabad), founded in 1610 by the regent Malik 'Ambar, contains two mosques of this time, the Jāmi' and Kalā masjids, both in the Bijapur style.

Painting is represented by the manuscript of the *Tārīkh-i Ḥusain Shāhī* at Poona, which is a history of Ḥusain I (1553–65) and describes the great victory over the Vijayanagar kingdom at the battle of Talikota in 1565; the style of the manuscript is partly Turkoman, partly Vijayanagar-Hindu. To the court of Murtazā I Diwāna (1565–86) we may possibly ascribe part of the Deccan *Rāgmālā* miniatures (Coll. Maharaja of Bikaner), in a very elegant style (the rest being decidedly of Bijapur origin).

The Barīdshāhs (1492/1528–1618), who originally were prime ministers of the Bahmanī sultans, ruled over Bidar, the former Bahmanī capital. They have left few monuments of their own. In their tombs at Bidar the usual domed cube is transformed into a towerlike open hall resting on four pilasters, the dome of which is borne by a high cornice of friezes with inscriptions.

The two Deccan styles of great importance were those of the sultanates of Bijapur ('Adilshāhs; 1490–1686) and Golconda (Quṭbshāhs; 1512–1687). The art of these sultanates can be divided into three phases: the aftermath of the Bahmanī tradition (until ca. 1570–80); the period of typological and esthetic Hinduization from the decline of Vijayanagar (until the middle of the 17th cent.); and the period of growing Moghul influence (throughout the 17th cent.).

The first 'Ādilshāhs, in a difficult position between the Hindus of Vijayanagar and their Moslem colleagues, could not build much. Yūsuf (1490–1510), who resided at Raichur, erected the Shaykh Rauza at Gulbarga; Ismā'il (1510–34) settled in the Arh Qila (citadel) of Bijapur, and Ibrāhīm I (1534–57) built a small mosque there; his minister 'Ain-ul-Mulk built a mosque (1556) in the suburb of Ainapur; all these are in the late Bahmanī style. Under 'Alī I (1557–80) an intensive building activity began at Bijapur. Most of the fortifications of the town were constructed at this time; the 'Adālat Mahal and the lofty Gagan Mahal (used as an audience hall) were built within the Arh Qila; the Jāmi' Masjid (1565–70), Chānd Baōri (a pond constructed by the queen Chānd Bībī in 1579), palace and mosque of Mustafā Khan (d. 1581), and 'Alī I's mausoleum were erected. Probably the water palace at Kumatgi (with Persian murals) also dates from this period. The style of these buildings is still that of the Bahmanī period, but enlarged to grandiose proportions; Vijayanagar-Hindu elements are added to it, richly carved wooden pillars and brackets in the ladies' balconies of the Gagan Mahal, Hindu eaves and peacock brackets at Kumatgi, and Hindu female figures in the frescoes there. In the *Nujūm-al-'Ulūm* manuscript (Dublin, Chester Beatty Lib.), we find side by side almost pure Vijayanagar female figures and ornaments and Turkoman male figures.

Ibrāhīm II (1580–1626; PL. 21) erected the following buildings at Bijapur: the Ānand Mahal (ladies' audience hall, 1580) and the Jal Mandir (water pavilion), both in the Arh Qila; the Mihtar Mahal (a small mosque with high gateway, 1620); the Andū Masjid (1608); the mosques of the queen Malika-i Jahān (1587) and Ikhlās Khan (1597); and the Tāj Baōri (another pond, built by the queen Tāj Sultana). To the west of Bijapur Ibrāhīm II constructed the new palace town of Torwa (Nauraspur) after 1599, which contains the palaces of the sultan's Hindu dancing girls, the Sangīt Mahal (PL. 20), and Nārī Mahal; to the east, the ruined tomb of Malika-i Jahān. In these the Hindu element predominated (especially in the Jal Mandir, Mihtar Mahal, and Andū Masjid); it then became more and more integrated until at last it determined the general taste of Bijapur art, notwithstanding another strong influx of Islamic motifs from Arabia, Persia, and the Moghul empire. Architectural forms lost their technical functions and assumed a predominantly sculptural character, with an exuberance of richly modeled details, restless "baroque" outlines, pronounced chiaroscuro effects, and a dreamy unreality.

Painting too followed the same pattern: first the semi-Vijayanagar style (see DRAVIDIAN ART), of 'Alī I's reign (the *Rāgmālā* miniatures in Bikaner; *Mālavī Rāgiṇī*, Baroda); then the Moghul style, which was developed during Akbar's reign, but with a copious addition of gilding; and finally the later Safawid style of Riẓā-i-'Abbāsī (q.v.). Examples of minor arts include a very interesting ivory box with portraits of the young Ibrāhīm, Chānd Bībī, and Ikhlās Khan, as well as textiles and china.

Under Muḥammad (1626–56) the taste of the Moghul empire began to make itself felt. The Ibrāhīm Rauza (mausoleum of Ibrāhīm II; IV, PL. 132) represents the most extreme Hinduization of Bijapur art, but its wall decorations reveal Ottoman influence, which is most in evidence in Muḥammad's tomb at Bijapur, the Gōl Gumbaz (X, PL. 156). This immense domed hall (135 sq. ft. in area, 200 ft. high, with a dome 124 ft. in diameter) was inspired by the Hagia Sophia in Istanbul and is one of the mightiest buildings in the world. Other edifices of this reign are the Sat Manzil (Seven Stories) and the mosques of Chinch Diddī and Bukhārī, all in the Arh Qila at Bijapur; the Champak

Mahal, for favorite Hindu queens; the Āthār Mahal, a Persian garden palace clumsily painted with murals in the style of Paolo Veronese, later transformed into a Moslem sanctuary; the mosques of the "Two Sisters" and Rangīn; and the mosque in the suburb of Shahpur. Painting succumbed more and more to Moghul influence, distinguished merely by stronger outlines, much gilding, and depiction of the local costume.

To the period of decline (1656–86) belong the last additions to the impressive fortification system, which permitted the town to survive seven sieges by the Moghul emperors. 'Alī II, whose unfinished mausoleum in the Arh Qila was intended to be even more impressive than the Gōl Gumbaz, was buried by the side of his father. Sikandar ended his days as a Moghul prisoner. Only the palace of Khawāss Khan, regent for the last boy king, survives from this dreary period. 'Adilshāhī monuments are, of course, found over the whole length and breadth of the Bijapur kingdom, but with few exceptions they are either utilitarian or small and simple.

In the eastern Quṭbshāhī kingdom of Golconda, art developed on parallel lines. However, as it was farther from the Moghul empire as well as from the sea routes to southwestern Asia, other Islamic style influences hardly penetrated and Hindu art was more extreme and persistent. The late Bahmanī style dominated the early Quṭbshāhī period (1512–50), especially in the Fort at Golconda, founded by Sultan Qulī (1512–43). The Fort is on a steep granite hill, surrounded by 87 bastions and mighty gates, and encloses the Jāmi' Masjid, Naqqar Khāna (music gallery), Sila Khāna (armory), palaces, and the Bālā Hissār (citadel at the summit). The period of Hindu influence set in with Ibrāhīm (1550–80). He expanded the Fort from 1550 to 1559 in order to make room for his vast palaces; the Lower Fort and the town, which had no natural defences, were strengthened by mighty granite bastions (e.g., Ibrāhīm Burj) and gates (e.g., Makkī Darwāza) behind a broad moat and the artificial Langar Lake. On the plain east of Golconda a garden city began to develop near the Husain Sagar (lake) and the Purāṇa Pūl (Old Bridge) over the Musi River. In the new palaces, the mosques of Mustafā Khan (1562) and Mullā Khiyālī (1570), and finally in Ibrāhīm's tomb in Golconda, the Bahmanī tradition reached another peak of refined elaboration, but for the first time Hindu elements of style and ideals appeared, especially the bulbous dome emerging from a circle of lotus petals.

The reigns of Muḥammad Qulī (1580–1612), Muḥammad (1612–25), 'Abdullāh (1625–72), and Abū'l-Ḥasan (1672–87) represent the golden age of Golconda art: at Golconda are the mausoleums of Jamshīd (1543–50), Muḥammad Qulī, Muḥammad, 'Abdullāh, and of the princesses Hayātbakhsh Begam (1617) and Fāṭima Khānum (1673), and the 'Ambar Khāna (treasury); at Hyderabad, the town founded in 1589 south of the Purāṇa Pūl, are the Chār Minār (1591; 186 ft. high), the Jāmi' (1598), Mushīrābād (1611–25), Pēmatī (1662), Sāliha Bībī (1656/57), and Tolī (1761) masjids, the Bādshāhī 'Ashūr Khāna (1593–97), and the Gōsha Mahal Hauz (ca. 1672–87); at Bhagnagar (between the two towns) are the mosque of Bhāgmatī and the garden palace of Tārāmatī; finally, at Janwada are the mosque and tomb of the princess Ḥusaina Begam. In Muḥammad Qulī's tomb the Hindu element is confined to arcaded porches. But thereafter Islamic and Hindu elements fused into a bizarre style — overelaborate, restless, and full of chiaroscuro effects, with far-projecting balconies, galleries of miniature pavilions, bulbous domes, and onion-shaped minaret cupolas in the form of lotus buds or open lotus flowers. The sole exception is the Bādshāhī 'Ashūr Khāna, with its walls of encaustic tiles painted in a modified Ottoman taste.

Early Quṭbshāhī painting is lost but can to some degree be reconstructed from the painted cotton chintzes (pintados) exported from Masulipatam in the 17th century. The earliest known illustrated manuscripts are the *Hāṭifī* of Patna (1576) and the *Khāwar-nāma* (1645; Bombay, Prince of Wales Mus.). Most miniatures (brought to Europe by Dutch merchants) belong to the last years of 'Abdullāh and the reign of Abū'l-Ḥasan (i.e., after the sack of Hyderabad by the Moghuls in 1656). Their style is very similar to that of late Bijapur, but the Vijayanagar style also continued to be used for portraits of famous Hindu courtesans.

Both the Bijapur and Golconda styles disappeared before the end of the 17th century, but they had a decisive influence on Moghul architecture after the reign of Aurangzēb and on painting at the court of the Nizams of Hyderabad in the 18th century.

Moghul art, which superseded the earlier Indo-Moslem styles, was strongly dependent on them only from about 1560 to 1620. Its later "imperial" style, an original creation, absorbed little from Bengal and the Deccan and definitively ousted all older traditions in the late 17th and early 18th centuries.

INDONESIA. The Republic of Indonesia, which gained independence in December, 1949, comprises in the main the group of islands situated to the southeast of the Asian continent, extending from the Malay Peninsula to Australia and surrounded by the South China Sea, the Pacific Ocean, and the Indian Ocean. The northern and northwestern area of Borneo and the eastern half of Timor (with adjacent small islands) are not a part of the Republic. However, they are included in the following geographical discussion of the region. The principal Indonesian islands are Sumatra, Java, Borneo, and Celebes. The art of Bali, also, has attracted particular attention, and various other islands are of special interest in the field of primitive art.

SUMMARY. General considerations (col. 31). Nias and the Batu Islands (col. 32). Mentawei Islands (col. 32). Engano (col. 33). Sumatra (col. 33). Java and Madura (col. 34). Bali (col. 35). Lombok (col. 36). Sumbawa (col. 36). Eastern group of the Lesser Sunda Islands (col. 36). South West Islands and South East Islands (col. 37). Borneo (col. 37): *Kalimantan; Sarawak, Brunei, and North Borneo.* Celebes (col. 39). Moluccas (col. 39). Modern Indonesia (col. 40): *Djakarta; Bogor.*

GENERAL CONSIDERATIONS. The Indonesian archipelago owes its importance largely to its location near the straits utilized in the maritime routes between India and China. By virtue of the contacts thus afforded, particularly the settlement of Indian colonists along the coasts, the great religions of India and Indian designs and traditions were introduced during the first centuries of the Christian Era (see INDIA, FARTHER). A strongly Indianized civilization was added to and often superimposed upon the native Malayo-Polynesian beliefs and customs. Indianization developed principally in Sumatra and Java, especially from the 7th century in the prosperous kingdom of Śrivijaya and under the Śailendra dynasty. Although there are a few works dated to an earlier period, it is possible to trace the evolution of art in the two centers only from the time when the monuments and sculptures were executed in durable materials. This art, serving the great religions of India (see BUDDHISM; HINDUISM) and clearly marked by Indian artistic influences, developed over many centuries, shaped more and more by local tendencies (particularly after the 10th century). Its evolution was arrested or transformed by the introduction of Islam, the influence of which was intensified during the 15th and 16th centuries; from that time the ancient traditions survived occasionally in monuments of an entirely different type, such as mosques and palaces (*kraton*). On the small island of Bali, east of Java, the evolved Javanese art succeeded in maintaining itself, though it was more and more impregnated with an indigenous character. The art of Bali remained faithful to the cults and legends drawn from Hinduism, but these also were altered by autochthonous contributions.

Madeleine HALLADE

Following the Dutch conquest of Java in the 17th century, Indonesia was opened to European influences which, although not determinative, became noticeable in architecture and in some forms of handicrafts. Only in the years since its independence has Indonesia integrated into its life those aspects of international civilization which have greatly modified the appearance of the country.

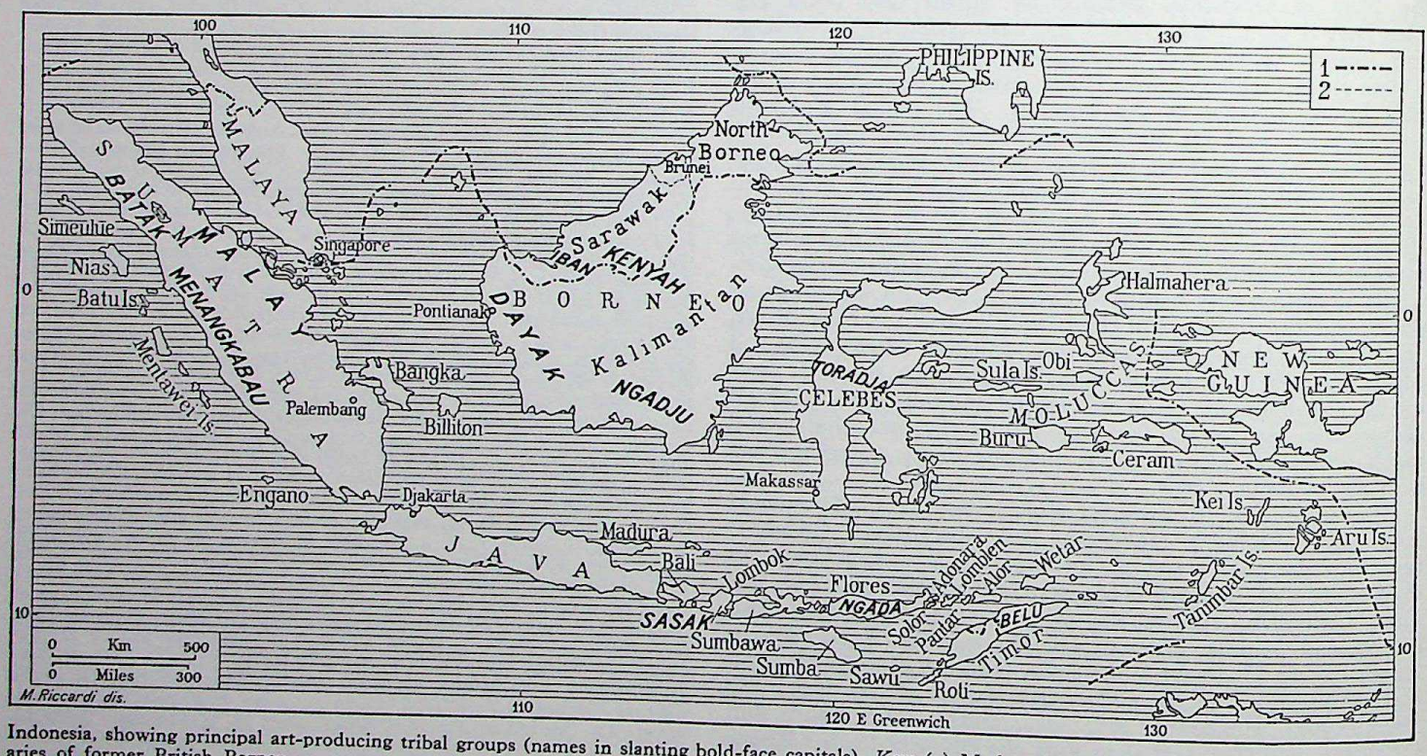
BIBLIOG. See bibliog. for INDONESIAN CULTURES.

NIAS AND THE BATU ISLANDS. The island of Nias abounds in wooden sculptures, ancestor images (PL. 25), and figures serving apotropaic or magic purposes. The practice of erecting megalithic monuments survived until recently. In southern Nias these monuments were frequently given artistic forms, the menhirs being replaced by obelisks and the dolmenlike structures by well-shaped stone benches. Ancestor images of stone, some of superhuman size, and fantastically stylized stone animal figures are found in southern and central Nias. The large stone stairs giving access to the hilltop villages of southern Nias are works of true artistic merit, as are the houses of southern chiefs, supported by large wooden columns and covered by powerful towering roofs; some of the relief decorations on the inner walls and columns of these houses correspond to motifs characteristic of the early Buddhist art of India. Together with the floral designs in relief on some megalithic monuments, these decorations suggest that the flowering of art in southern Nias and in the Batu Islands may have been stimulated by slight contact with Indian culture, probably not later than the 3d century of our era.



Indonesia, showing principal art-producing tribal groups (names in slanting bold-face capitals). *Key*: (1) Modern national boundaries; (2) internal boundaries of former British Borneo.

BIBLIOG. E. E. W. G. Schröder, Nias, 2 vols., Leiden, 1917; J. P. Kleiweg de Zwaan, Het eiland Nias en zijn bewoners, Nederlandsch-Indië Oud en Nieuw, XI, 1926–27, pp. 322–41, 355–72; P. Wirz, Het oude Nias, Nederlandsch-Indië Oud en Nieuw, XIII, 1928–29, pp. 163–74, 197–207; R. Heine-Geldern, Survivance de motifs de l'ancien art bouddhique de l'Inde dans l'île de Nias, Artibus Asiae, XXIV, 1961, pp. 299–306.

MENTAWEI ISLANDS. The lintels and walls of the large communal houses are decorated with paintings representing men, animals, scenes of hunting and fighting, and the like. Ornamental designs, consisting of spirals and plaited bands, correspond to those found in various regions of Sumatra.

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

BIBLIOG. A. Maass, Die primitive Kunst der Mentawai-Insulaner, ZfE, XXXVIII, 1906, pp. 433–55; P. Wirz, Het eiland Sabiroet en zijn bewoners, Nederlandsch-Indië Oud en Nieuw, XIV, 1929–30, pp. 337–48.

ENGANO (Enggano). The native population of Engano and its very archaic culture have become extinct. Specimens of its art, surviving only in museums, consist of wood carvings, human figures and heads, and figures of birds. The style, unique in Indonesia, resembles that of the Cook Islands in Polynesia.

BIBLIOG. E. Modigliani, L'isola delle donne, Milan, 1894; J. Keuning, Holzschnitzereien von der Insel Enggano, Nachr. der Gesellschaft für Natur- und Völkerkunde Ostasiens, LXXXIII, 1958, pp. 10–17.

SUMATRA. The Pasemah plateau in southwestern Sumatra is rich in stone sculptures and reliefs of a highly dynamic style, representing single persons or groups, men riding on buffaloes (PL. 25) or elephants, and the like; similar subjects appear in paintings of the same style on the inner walls of some of the stone cist graves and chamber tombs of the region. The weapons, ornaments, and bronze drums depicted in the sculptures indicate a date in the second half of the 1st millennium B.C., possibly extending into the first centuries of the Christian Era.

Among the Batak, wood carving (ancestor images, protective figures, masks, staffs, or so-called "magic wands") is richly developed (PLS. 26, 28). The country also abounds in ancient and recent stone sculpture (PL. 24), the outstanding works of Batak monumental art being the magnificent sarcophagi of the region of Lake Toba. Personal ornaments, sword hilts, scabbards, and other brass castings are richly decorated with ornamental designs and frequently with representations of buffalo heads and lizards as well. In the 19th century Batak goldsmiths still produced fine ornaments decorated by the granulation technique. Textile art, formerly distinguished by splendid *ikat* cloth, has badly deteriorated. The houses of the Toba and Karo Batak excel in their graceful roof forms and their carved or painted decoration (PL. 23).

The decorative designs of Sumatra Malayan wood carvings and metal objects generally take the form of stylized plant motifs derived from the art of the Hindu-Buddhist period. The most artistic silverwork is produced by the Malays of the Riouw Islands. In textile art the finest examples are the gold and silver brocades, which occasionally are combined with decorations in *ikat* technique. The weaving and embroidery of the Kroë region, in southwestern Sumatra, with such motifs as the soul boat (X, PL. 431), perpetuate designs and styles dating from the pre-Hindu period. The houses of the Menangkabau (Minangkabau) area of Sumatra, with multiple roofs which telescope into one another and with carved and painted decorations, merit special mention (PL. 23).

Robert HEINE-GELDERN

Palembang. The great artistic activity which characterized Sumatra from the 7th century to the 13th, and even into the 14th, was particularly evident during the height of power of the kingdom of Śrīvijaya, which had its capital in the Palembang region, on the Musi River. The radiation of this activity was felt as far as Ligor in the northern part of the Malay Peninsula, where several monuments of a similar character were erected. Nonetheless, the evolution of Sumatran art most often resembled that of Javanese art, the contacts between the two regions having multiplied unceasingly. The Palembang region was an important center of Buddhist culture. Among the oldest objects which have been discovered there is a large image of the Buddha in granite (5th–6th cent.), probably imported from the island of Bangka to the northeast.

Gedong Sura. The site of Gedong Sura, to the southeast, as well as others in this region, has provided beautiful stone and bronze sculpture (8th–14th cent., perhaps 15th cent.). According to F. M. Schnitger, a group of funerary temples was constructed at Gedong Sura during the 16th century.

Malayu and Jambi. Various remains of monuments have been discovered at the site of Malayu, farther to the north, while at Jambi, near the mouth of the Batang Hari River, seven groups of ruins have been brought to light, of which one, the Stano, or royal mausoleum, could have been a Moslem edifice. The importance of the other (Buddhist) temples leads one to suppose that they formed part of a great city. These temples were built between 1050 and 1250. To the west, near the source of the river, the site of Sungei Langsat has yielded a great image of the deified king Ādityavarman.

Muara Takus. Farther to the north, in the high valley of the Kampar River, the ruins of Muara Takus (11th–12th cent.) were included in a part of the city surrounded by a wall of earth; the best preserved edifice is the Maligai stupa.

Padang Lawas. Numerous monuments in ruins are found in the area of Padang Lawas on the Upper Baruman River and its tributary, the Panei; probably located here was a kingdom bearing the latter name, which is mentioned in the inscriptions at Tanjore and must have been subject to the king of southern India in 1024. The Si Pamutung, the three sanctuaries of Bahal, and others of these temples are among the largest in Sumatra; according to F. M. Schnitger, the large temples date from the 11th and 12th centuries. Numerous monuments have been restored by the Dutch archaeological services, and many sculptures from Sumatra are preserved in the museum at Palembang.

JAVA AND MADURA. Of the early art known in these islands, there are bronze drums and richly decorated ceremonial battle-axes which date from the late prehistoric Dông-so'n period. Western and central Java are rich in stone sculptures, more or less primitive in character, occurring in large accumulations at such places as Artya Domas near Bogor (Buitenzorg). Apart from the genuinely primitive works, which cannot be dated but might be truly prehistoric, others show some Hindu-Buddhist influence. The production of sculpture in this style continued at least until the 14th century. Some stone statues and stone reliefs of eastern Java may date from the last centuries before Christ or from the first millennium of our era.

Robert HEINE-GELDERN

Two regions of the island of Java were successively the chief areas of artistic development: first, the central region, from the end of the 7th to the middle of the 10th century, then the eastern region, from that time until the 16th century.

The earlier period, called "Indo-Javanese" or, after the geographical area, "Central Javanese," was marked by the ascendancy of the dynasty of the Buddhist Śailendras, who reigned during the 8th century in the region; this ascendancy resulted in the spread of Buddhism and the building of numerous monuments consecrated to it. Meanwhile, other sanctuaries were dedicated to the Hindu divinities, for Hinduism also had been introduced from India during the first centuries of our era. Two archaeological zones may be distinguished in central Java. The plateau of Dieng, in the northern part, appears to have been occupied for nearly five centuries. Some forty Saiva monuments were built there, of which the earliest may date to the end of the 7th or the first half of the 8th century. The principal remains are those of eight temples (candi; Jav., *caṇḍi*), which survive in an old crater: candis Bhīma, Dvaravati, and Gaṭotkatja, each separate; the Arjuna group (candis Arjuna and Semar); and candis Śrikaṇḍi, Sembadra, and Puntadeva. In another crater is the group of temples of Gedong Sanga, while a little to the south are found Candi Perot and Candi Pringapus.

The most important groups of remains or monuments are found in the southern zone of central Java, distributed in the plains of Kedu and of Prambanam (a little more to the east). Borobudur (ca. 750–850) is the great Buddhist monument of the Kedu plain (PLS. 30, 33; III, PL. 485); not far off are candis Mendut and Pawon (PL. 34), probably its dependent temples. At the Hindu Candi Banon many sculptures of excellent quality have been found. In the Pram-

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

banam plain are grouped other Buddhist monuments: Candi Kalasan (consecrated 778, according to an inscription); Candi Sari, a monastery (vihara) of similar age; and Candi Sajiwan; then the great ensembles built later, candis Sewu (PL. 34) and Plaosan, built probably at the end of the 9th century and perhaps at the beginning of the 10th. The growth of power of the kings of Mataram engendered a revival of Saivism during the second half of the 9th century that was manifested in the great Hindu temple complex of Prambanam, Lara Jongrang, which was probably erected at the end of the 9th or the beginning of the 10th century.

Eastern Java became the center of development of civilization and art when the capital was moved to the area during the reign of Sindok (ca. 929–47), thus initiating what is called the "Eastern Javanese" period. Not far from the coast is the Gunung Gangsir (ca. 950), and near Mount Penanggungan sepulchral bathing places were erected at Djalatunda (end of 10th cent.) and Belahan (11th cent.). New construction, which seems to have been less frequent during the ascendancy of the kingdom of Kediri (12th cent.) on the middle course of the Brantas River, became more common at the end of the second decade of the 13th century.

Lying east of the Brantas, Singhasāri became the capital in the 13th century and remained so until the end of the century. The majority of its monuments are Hindu; examples are Candi Singhasāri and, a little to the south, Candi Kidal. Nearby is Candi Jago, consecrated to a Buddhism mixed with Saivism.

At the end of the 13th century the capital was shifted again, this time to Majapahit, south of the Brantas delta and west of Penanggungan. The power of the kingdom of Majapahit was manifested during the 14th century by an abundance of new construction scattered throughout eastern Java; among the chief monuments may be noted Candi Jabung (Buddhist) and Candi Kedaton in the east, Candi Surawana to the west, Candi Simping and Candi Sawentar in the south. Of particular importance is the large complex of Panataran, also in the south, probably begun in the 12th century but with principal monuments of the Majapahit period.

In the middle of the 15th century, from Mount Lawu (to the west) and from Mount Merbada and Mount Wilis as far as Penanggungan (to the east), the mountains scattered in the interior of the island became places consecrated to late Hinduism mingled with indigenous cults. Religious edifices, such as Candi Sukuh on Mount Lawu, were erected; some of these persisted even after the definitive establishment of Islam. Following the end of the kingdom of Majapahit (beginning of 16th cent.) and the growth of power among the Moslem sultanates, palaces, mosques, and tombs were built. Some monuments conserved stylistic traditions of the preceding period in eastern Java; examples are the minaret in Kudus and the mosque in Sendangduwur on the northern coast. Until the middle of the 18th century immense and magnificent palaces (*kraton*) were built of timber in Jogjakarta and Surakarta, cities of central Java.

The Dutch archaeological services have restored a large number of Javanese monuments; numerous sculptures are preserved in various museums in Java itself, particularly in the museum at Djakarta (formerly Batavia), while others may be found in the museums and private collections of many lands, particularly in those of the Netherlands, in Amsterdam (Koninklijk Instituut voor de Tropen) and in Leiden (Rijksmuseum voor Volkenkunde).

BIBLIOG. See bibliog. for INDONESIAN CULTURES.

Madeleine HALLADE

With the establishment of Islam, the art of Java and Madura came to be expressed chiefly in textiles, particularly those decorated by the batik technique, and in masks, wayang (shadow-play) puppets, metalwork, and weapons. Many krises are of high artistic quality. Ornamental wood carving has been dominated by stylized plant ornaments derived from the ancient Indian lotus motif; it is seen at its best in the exuberant interior decorations of houses at Kudus and Japara.

Robert HEINE-GELDERN

BALI. The tiny island of Bali was influenced very early by Hindu culture, in the earliest period probably by India directly, and later through the intermediary of the Javanese kingdoms. Before the 10th century there existed on the island a society with an Indo-Balinese culture which was independent of Java and had adopted Buddhism and Saivism. Then, under Sindok and in particular under Erlangga (Airlangga; 991–1049?), closer relations between Bali and Java introduced Javanese culture into Bali and favored the predominance of Hinduism. These relations were intensified under the kings of Majapahit (14th–15th cent.) and, in the face of the invasion by Islam, the island became the refuge for Javanese faithful to their beliefs and to their older traditions.

Several sculptures of the 8th–10th centuries (contemporary with the Central Javanese period) have been discovered on Bali, some of which must have belonged to wooden temples which have disappeared, although others may have been imported from the large neighboring island. The oldest monuments, which are not earlier than the Eastern Javanese period, are found in the southern part of the island. These include the tomb complex of Tampaksiring (end of 11th cent.), the cave of Goa Gajah (13th cent.?) in which the entrance has the appearance of a *kala*, or monster's head, and the temple and bathing place of Ye Ganga near Perean (ca. 14th cent.). The style of these monuments is related to that of central Java.

The more typically Balinese temples (*pura*) are particularly numerous, and many are very recent. In each village they are dedicated respectively to the village itself, to the dead, and to the sea. The most important temples are in the south, though some are found in the north. Among those of the late period (17th cent. to date) characteristic of the architecture of the south are the Pura Kehen near Bangli, the Pura Sempidi near Tabanan, the Pura Satria near Denpasar (or Badung), and the Pura Dasar near Klungkung. In the northern region are the temples of Singaraja, Sangsit, Bila, Jagaraja, and others. Although elements borrowed from the Eastern Javanese style continue to exist, the originality of Balinese art is more and more strongly affirmed in such temples as these by the increasing importance of the entrances and by the local, and often fantastic, sculptures which adorn them.

Madeleine HALLADE

A notable survival of the Dông-so'n period is a huge bronze drum, of hourglass shape and richly decorated, preserved in a temple at Pedjeng.

In the present day, wood and stone sculpture in the traditional style continues to flourish, and figures of gods, demons, men, and animals are still being produced. The reliefs found on the doors of princely mansions are of high artistic quality (PL. 37). Paintings in the traditional style on wood and cotton, as well as the illustrations of palm-leaf manuscripts, represent scenes from myth and epic and from the ancient literature. Silverwork, kris hilts, and textiles are outstanding among the minor arts. The textiles made in the village of Tenganan are unique in that they are decorated by the double *ikat* technique (warp and weft *ikat*; PL. 40). The designs include geometric and flower patterns as well as figures in wayang style.

Completely new styles in painting and sculpture, which came into vogue about 1930, soon inspired many native artists to produce works of great charm and originality.

BIBLIOG. W. O. J. Nieuwenkamp, Bali en Lombok, 3 vols., Edam, 1906–10; W. O. J. Nieuwenkamp, Zwerftochten op Bali, 2d ed., Amsterdam, 1923; P. A. J. Moojen, Kunst op Bali, The Hague, 1926; W. O. J. Nieuwenkamp, Bouwkunst van Bali, The Hague, 1926; W. O. J. Nieuwenkamp, Beeldhouwkunst van Bali, The Hague, 1928; M. Covarrubias, Island of Bali, New York, 1947; R. Goris and P. L. Dronkers, Bali, Djakarta, n.d.

LOMBOK. The art of the descendants of Balinese conquerors who came in the 18th century conforms to that of Bali. The princely pleasure seat at Narbada, with terraced gardens, waterworks, and bathing places, is noteworthy. The art of the Mohammedan Sasak, the indigenous population, is of little consequence.

BIBLIOG. W. O. J. Nieuwenkamp, Bali en Lombok, 3 vols., Edam, 1906–10.

SUMBAWA. A few sarcophagi, discovered in the western part of the island, are decorated with human and animal figures in relief, corresponding in style to those of eastern Java and probably of the same date. Six bronze drums of late Dông-so'n style, found on the small island of Sangeang, off the coast of Sumbawa, are now in the museum at Djakarta.

The art of the present population is little known. Ornamental wood carvings utilize mainly plant motifs and bird and serpent (naga) figures. The very fine krises and ceremonial weapons, as well as the elaborate gold crown, set with diamonds, of the sultans of Sumbawa may have been imported from Java or Celebes rather than of local manufacture.

BIBLIOG. J. Elbert, Die Sunda-Expedition des Vereins für Geographie und Statistik zu Frankfurt am Main, II, Frankfurt am Main, 1912.

EASTERN GROUP OF THE LESSER SUNDA ISLANDS. This group comprises the islands of Sumba, Flores, and Timor and the smaller islands of Sawu, Roti, Adonara, Solor, Lomblen, Pantar, and Alor. Unlike the people of Lombok and Sumbawa, who are Mohammedan, the inhabitants of the eastern group adhere to tribal beliefs, with the exception of considerable numbers of Christian converts. Accordingly, the local arts belong to those indigenous styles which did

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

not come under the influence of Javanese art. Exceptions are the flower patterns of Javanese derivation on a few textiles and the decoration on bamboo receptacles in western Timor.

The island of Sumba has magnificent megalithic tombs and monuments, which are richly decorated with ornamental designs as well as with human and animal figures in relief or in the round (PLS. 24, 25). In Flores occur ancestor images of wood and some of stone, while the island of Alor abounds in dragonlike cult figures of serpents, many decorated with spiral motifs in openwork. Some of the houses of the Ngada in central Flores and of the Belu in central Timor are particularly rich in ornamental carvings. Fine personal ornaments of gold, silver, and brass have been produced in Sawu and Flores in recent times.

The bronze or brass drums of hourglass shape (*mokkos*), used as currency on the island of Alor until the early part of the 20th century (see COINS AND MEDALS; III, PL. 416) are not of local manufacture but were imported from Java. The oldest ones, decorated in a degenerate version of the Dông-so'n style, are related to the drum of Pedjeng in Bali, while later *mokkos* have motifs corresponding to the Eastern Javanese style of the Hindu-Buddhist period or, in some cases, derived from the European baroque.

Sumba combs of tortoise shell, horn, or wood, as well as spoons of wood, horn, or coconut shell from Timor, are notable for their rich openwork decoration. Among textiles decorated by the *ikat* technique, those from Sumba (PL. 40) and Timor are outstanding.

Three ceremonial bronze axes of the Dông-so'n period with unusually rich decorations have been discovered on the island of Roti.

BIBLIOG. W. O. J. Nieuwenkamp, Iets over Soemba en de Soembaweefsels, Nederlandsch-Indië Oud en Nieuw, VII, 1922–23, pp. 294–313; W. O. J. Vroklage, Ethnographie der Belu in Zentral-Timor, 3 vols., Leiden, 1952.

SOUTH WEST ISLANDS AND SOUTH EAST ISLANDS. These easternmost island groups of Indonesia abound in wooden sculptures, images of ancestors and protective deities. Some are boldly stylized, their features reduced to the simplest possible forms, while others manifest an impressive realism; all are typical examples of the survival of the ancient Indonesian monumental style into recent times. By contrast, the ornamental designs of the region, spirals and their derivatives, are characteristic of the Indonesian ornamental style of Dông-so'n origin. Among the works most representative of this style are the decorative wood carvings (PL. 26) and the openwork scrolls of combs, carved of bone or ivory, of the Tanimbar Islands.

Only in the Kei Islands, where a large proportion of the population is Moslem, were the old designs to some extent displaced by plant motifs of Malayan style.

BIBLIOG. J. F. Snelleman, Houtsnijwerk van Groot-Kei, Nederlandsch-Indië Oud en Nieuw, V, 1920–21, pp. 326–32; P. Drabbe, Het leven van den Tanembarees (IAE, XXXVIII, Sup.), Leiden, 1940.

BORNEO. The political division that exists between Kalimantan, which pertains to the Republic of Indonesia, and the remaining area of the island (Sarawak, Brunei, and North Borneo), is not readily applied to the art. In some cases tribal groups as well as motifs extend across the border and related trends may be pointed out in different areas.

Kalimantan. Among the scarce monuments of the Hindu-Buddhist period the most noteworthy is a bronze statue of the Buddha from Kota Bangun in eastern Borneo. Gold objects of this period include Buddhist and Hindu images, incense burners, and jewelry. The island abounds in ancient earthenware and porcelain vases of Chinese and Indochinese origin, which are highly appreciated and treasured by the native tribes.

The art of the native peoples today manifests a variety of styles and of subjects. The Olo Ngadju in the southeast erect memorial and sacrificial posts carved with reliefs of men and animals, characteristically surmounted by figures in the round (PL. 26; X, PL. 133). Their paintings on wooden boards depict the boats of the gods, the soul boat, the abodes of the deceased, and the celestial tree. The neighboring Ot Danom excel in designs on bamboo depicting scenes with many figures which represent the death rites, mythological subjects, and the like. Masks of southern Borneo represent human or demoniac faces, those of western Borneo mostly animals.

Excellent carved figures of hornbills, used in certain ceremonies, are produced by the Iban group, settled in the northwest on both sides of the border. The ornamental designs these people execute on bamboo are influenced by the Malayan floral style of Indian origin; by contrast the patterns of their *ikat* cloths display the genuine old Indonesian style of textile decoration at its very best.

The art of the central Borneo tribes (PL. 29; IX, PL. 244), such as the Kayan and Kenyah, who extend into Sarawak as well, surpasses all other primitive styles of Indonesia in the variety and refinement of its ornamental designs. Characteristic of this area are richly decorated funerary huts, supported by two wooden columns and having two stylized animals, so-called "dogs" (*aso*), on the roof. The art of the Moslem coastal population conforms to the general Malayan and Javanese patterns.

Sarawak, Brunei, and North Borneo. In this area the indigenous arts have survived with particular vigor, partly for historical reasons, partly because of the great size of the island and its lack of internal communications. Although this situation is undergoing rapid change, particularly as a result of the labors of missionaries, it is still possible to find here a "living museum" of primitive art.

In recent years valuable information concerning earlier art forms in this area has been recovered. A magnificent set of wall paintings has been found in the Great Caves of Niah, about halfway up the western coast of the island. Though crude in conception, they manifest at least two themes which persist into the present. The first is the curving and twisting line, representing in one case probably the same rhinoceros hornbill that dominates many contemporary designs, particularly among the Iban or Sea Dayaks of the southwest. The second is the repeated representation of the soul boat, or ship of the dead, on the deck of which figures dance with arms akimbo. The latter motif has become stylized almost beyond recognition in this area, though it survives strongly among the Ngadju in southeast Borneo, where the resemblance between Ngadju patterns and Dông-so'n designs has often been pointed out. The wall paintings discovered at Niah in 1958 provide a link between the ancient Dông-so'n and the living present; they are associated with actual carved soul boats lying on the cave floor, which contain human remains and are surrounded by objects of the early metal age along with very early Chinese ceramics imported from the mainland.

In the far hinterland of the Kelabit uplands, at the junction of the Sarawak, North Borneo, and Kalimantan borders, other evidence of prehistoric art forms is provided by megalithic remains. The contemporary inhabitants preserve a living megalithic culture but do not execute the same designs that appear on the older forms, which they attribute to a pre-Kelabit people. A classic example of this early design in stone is a nearly life-size figure spread-eagled across a boulder, represented with elongated ears and a headdress of Buddhist type; the swirled and curved treatment of the feet is paralleled in the decoration of modern bark coats worn by warriors on the Baran and Bahau rivers.

Undoubtedly Chinese influences were, both directly and indirectly, constantly intermixed with the local art for as much as two thousand years. Particularly among the Iban, patterns occur which closely correspond to those on Chou bronzes, though here executed most often in textiles and tattooing.

Mohammedanism was introduced very late (14th cent.) and in diluted form. Its effects on the art were limited, though, along the coastal fringe, the convoluted and spiralistic treatment of human representations branched out into a different symbolism.

In the present day, although only three or four wood carvers (in the village of Long Jigan on the Tinjar River) are to be viewed as professional artists, almost every individual has some sort of artistic skill, evidenced in the decoration on the walls of long houses, tattoo patterns, wooden images and door carvings of apotropaic significance, dance shields, magnificently carved coffins, and carved prows of boats, as well as in the decoration of many objects such as parangs, bamboo pipes, woven mats, seat pads, or boxes for blowpipe darts.

While there is great variety from tribe to tribe (for example, in the decoration of wooden plank surfaces), a continuous thread of

UP State Museum, Lucknow

approach and expression is a striking feature of the design. Certain types of baskets with elaborate red "tendril" patterns are produced in almost identical form by fifteen to twenty different groups. Perhaps the chief distinction to be drawn in different areas (though they overlap) lies in the preference for either animal or vegetal motifs, and here tribal lore plays a considerable part. The Sea Dayaks produce some of their finest art in great wooden carvings of the rhinoceros hornbill, the tribal ancestor, and the northwestern peoples are mainly oriented to animal mythology, whereas the Land Dayaks in the extreme southwest prefer vegetal themes, a tendency which increases toward the east in Kalimantan. However, it is clear that deep trends out of the past are widespread. Perhaps the most overwhelming impression produced by the art is the predominance of spiraling or curving lines and forms, which prevails throughout a very large part of the country, notably in the dynamic design of the Kenyah, Kayan, and Kelabit.

CELEBES (Sulawesi). Noteworthy among prehistoric monuments is the rock painting representing a boar, probably of the mesolithic era, discovered in a cave in southwestern Celebes. Central Celebes abounds in menhir statues and in large stone vats which originally served as tombs but which have been robbed of their contents. Some of the vats are decorated with reliefs, mostly depicting stylized human faces, which may date from a late phase of the Dông-so'n period. A large and richly decorated bronze drum of continental origin, probably from the first 500 years of the Christian Era, is preserved on the small island of Salayar, south of Celebes.

Representative of the Hindu-Buddhist period is a fine bronze image of the Buddha, half life size, now in the museum at Djakarta. It was found on the Karama River near the western coast; its style indicates that it must have been imported from southern India or Ceylon, probably between A.D. 200 and 500.

At Minahassa, in the extreme northeast, are found a number of sarcophagi (*waruga*) that date from the 15th to the 19th century. These sarcophagi are monolithic rectangular receptacles with lids in the form of house roofs, and many are richly decorated with ornamental designs and with human and animal figures in relief.

The various tribes of central Celebes, now partly Christianized, are usually grouped together under the name Toradja. Wood carving (human figures, bulls' heads, etc.) and ornamental design are well developed among them; the houses, rice sheds (PL. 23), and covered bridges of the Saadang Toradja excel in the graceful form of their roofs as well as in their carved and painted decorations. The western Toradja produce large *ikat* shrouds with geometric patterns derived from interlinked human figures. Some of the northern Toradja dress in bark cloth decorated with painting or appliqué work.

The art of the Makassarese, Buginese, and other Moslem peoples of Celebes (wood carving, metalwork, krises and other ceremonial weapons, textiles) forms a subdivision of the general art style of the Moslem peoples of Indonesia; ornamental designs of Indian origin are favored.

MOLUCCAS. In the western part of Ceram a very original version of the ornamental art of Indonesia, based on the spiral and its derivatives, appears in wood carving and the decoration of bamboo objects. Bark loincloths and jackets from Ceram and Halmahera are richly decorated with painted ornaments, some of which are related to those of the northern Toradja of Celebes. Halmahera plaited ceremonial mats, which display geometric designs and human figures, are of excellent artistic quality. Peculiar to the Moluccas are wooden shields with inlay of shells and mother-of-pearl in geometric patterns. Ancestor figures (PL. 27) are striking here, as elsewhere. The art of the Moslems manifests the same characteristics as in other regions of Indonesia.

Robert HEINE-GELDERN

MODERN INDONESIA. No single influence can be said to determine the development of modern Indonesia, in spite of the Dutch occupation for nearly three and a half centuries and the concomitant growth of a group of mixed population. Having conquered some Javanese territory, the Dutch built Batavia (now Djakarta) in 1619 to further the growth of their commerce; it was a walled city on a Dutch model, with canals and brick houses. In the course of years, however, adaptation to tropical life produced the tendency to adopt as a model the Javanese open house, with the rooms opening onto galleries and arcades and with service quarters generally behind the house and connected to it by an open corridor.

European influence on architecture was sporadic from the 17th to the 19th century. It may be noted in the Dutch-style fortifications of Bantam (Fort Speelwijck, 1685), of Makassar (Celebes), and of the Moluccas, as well as in the simple Protestant churches (Ambon has an example). Sometimes it is limited to specific elements of decoration, as in several mosques built at Djakarta about 1760 in late Régence style, in a minaret and an adjacent structure for the mosque at Bantam, perhaps the work of a Dutch Moslem, and in the outer wall of the *kraton* (palace) in the same city. Unlike the architecture, local furniture, made by Chinese craftsmen under Dutch direction, was almost always inspired by European models; the rich production of the 17th and 18th centuries is characterized by European structural design decorated with carved plant motifs of Indonesian origin. Louis XIV, XV, and XVI, Queen Anne, Chippendale, Sheraton, and Adam styles were also widely copied in valuable Indian woods. This rather heavy and provincial output, originally destined for Europeans, afterwards found its way also into the kampong.

Active in painting in the 19th century was the Javanese Raden Saleh (Sjarif Bastaman, 1814–80), of European education and training, a portraitist and landscapist in the romantic tradition of Géricault and Delacroix. But a local center of artistic activity developed under direct European influence only in the 20th century, spurred, no doubt, in the 1930s by exhibitions of works from the collection of P. A. Regnault, which included such artists as Picasso, Campigli, Chirico, Chagall, and Ensor. The group of Indonesian painters born in the decade 1910–20 includes the names of Affandi (X, PLS. 418, 419), Hendra, Henk Ngantung, S. Sudjojono, and Agus Djayasuminta; their work reflects sentiment and instinctive enthusiasm but lacks stylistic vigor and is frequently weak in technique. (See ORIENTAL MODERN MOVEMENTS.)

The artistic tradition of Bali, strongly dictated by the cultural requirements of Hinduism, has retained both autonomy and originality in its representations of gods and goddesses, demons, and religious themes in general. One might speak of "European influence" in those temple bas-reliefs, strikingly grotesque, which depict Dutchmen on bicycles, in automobiles, or drinking beer; of more serious significance is the influence, particularly since 1925, of European and American artists who have been attracted to Bali, including Walter Spies, Rudolf Bonnet, and Miguel Covarrubias. The Balinese Anak Agung Gde Sobrat was the pupil of Spies and drew inspiration from him. Genre scenes, inspired by the activities of everyday life, have continued to increase in favor both in painting and in sculpture. One may observe in the latter medium a fairly consistent use of elongated and sharply stylized animal or human figures, a tendency fostered by I Tegelan and Ida Bagus Ketut Gelodog about 1930. Portraits made for the souvenir trade bring to mind the idealized Florentine portraits of the Cinquecento.

Jeanne TERWEN

In the years following World War II, and particularly since independence, Indonesia has undergone radical transformation. The most modern experiments of international architecture have been called into service to meet problems of urbanization and architectural needs. Many cities have been enlarged and modernized; examples are Jogjakarta and Bandung, the latter with new commercial centers and residential quarter, two large hotels, and monumental government buildings. A completely new city was created at Sumberdjaja in southern Sumatra (1952). In addition to the significant new building at Djakarta and Bogor (see below), examples may be singled out in the buildings of Stanvac Oil Company and the large new hospital in Palembang, southern Sumatra (both 1958), the Bank of Indonesia in Jogjakarta (1950), a Protestant church in Ambon (1952–56), an institute for the handicapped in Solo (1950), and the

Red Cross Institute in Malang. The Gajah Mada University was built at Jogjakarta in 1945 and the University of Indonesia (distributed among Bogor, Bandung, and Djakarta) in 1952, followed by at least ten other important educational centers in the next decade. The same period was marked by numerous new factories as well as airport, harbor, and other facilities.

* *

Djakarta (Batavia). The present name dates from 1948. Batavia was founded on the marshy coast of Java, following the conquest by J. P. Coen of the town of Jakarta (1619), which has almost completely disappeared. Batavia bore a Dutch stamp, with its canal system for the swamp, a walled *enceinte* and a rectangular fort to the north, a square with a city hall in Dutch style, Protestant churches forming a central core, and rows of Dutch houses. Slowly but continually, especially during the 19th and 20th centuries, the city spread out to the south. During the 19th century a type of "colonial" house, with galleries and arcades consonant with the demands of the climate, was widely used; these were substantially on an Indonesian plan, though the Europeans furnished the luxury of columns as external decoration. Remaining 17th- and 18th-century monuments are few: the town hall of 1712; the Portuguese Buitenkerk (1695), and some country houses. There are also many houses in colonial style, the President's palaces at Konigsplein and Rijswijk, as well as the Willemskerk (1839) on the central square and the Neo-Gothic house of the painter Raden Saleh at Tjikin. Among modern buildings are the Parliament, the Ministries (particularly that of foreign affairs, erected in 1958), the Central Hospital near the School of Medicine, and numerous office buildings (Bank of Java, Pasaad-Musin Corporation, state salt and soda agencies, Central Trading Co.). Noteworthy also are Tandjung (1952), the new residential area; the satellite suburb of Kebajoran (1958); and the Christian University of Indonesia (1953).

Bogor (Buitenzorg). In the middle of the 18th century, Buitenzorg grew up around the summer residence of the Governor-General, in the cool mountain area south of Batavia; in 1948 the city changed its name to Bogor. The architects were inspired by the English Blenheim Castle (Oxfordshire). In the northern part there still remains a suggestion of the older Pabatonweg, the original avenue of entrance. In 1834 the summer residence was destroyed by an earthquake; it was rebuilt on its former foundation, one story less in height.

English inspiration is also to be observed in the park, achieved under the Lieutenant-Governor Sir Thomas Raffles (1811–16). Characteristic of the city are the old avenues with tall trees and numerous 19th-century colonial houses. In the mid-20th century the city underwent substantial urban development; among the most modern edifices is the President's Palace (1952), which rises in the midst of a great botanical garden.

INDONESIAN CULTURES. The areas reached by the spread of Indonesian cultures are not strictly limited to the archipelago of Indonesia (q.v.) but include also Madagascar (see MALAGASY REPUBLIC), and extend eastward as far as the Philippines (q.v.) and the mountainous region of Formosa (see CHINA) with the neighboring island of Botel Tobago.

In order to understand the origin and history of Indonesian art styles, it is necessary to free oneself of the conception that styles change, as in the case of European art, with relative rapidity. In archaic cultures such as those of Indonesia, where the artist is strongly bound by tradition and finds little scope for innovations, styles may survive for thousands of years if not disturbed by outside influences. The art of Indonesian tribes is not exactly the same as it was two thousand years ago, of course — there were always changes and internal developments — but the essential characteristics of the respective styles survived. This makes it possible to trace the current art styles of Indonesia to their distant prehistoric origins.

A glance at the map will show that the mountain ranges and river valleys branching off fanlike from eastern Tibet and western China provided natural migration routes for prehistoric peoples. These routes were bound to lead to the sea and eventually into Indonesia. Therefore it is to the north, to continental southeastern Asia and to China, that one must look in order to discover the origins of the earlier art styles of Indonesia.

The first sections deal with these earlier styles, which preceded the introduction of Hindu-Buddhist art, and at the same time with tribal arts surviving in modern times. Here the emphasis is on their relationships, sources, and parallels; the distribution of tribal arts and an outline of their products are discussed in the article on INDONESIA. The succeeding sections deal with the Hindu-Buddhist art that evolved following the penetration of the Indian religions in the early centuries of the Christian Era, particularly with the great monuments and sculptures of Java and Sumatra and, to a lesser extent, Borneo; the two major periods or styles take their names from the central and eastern sections of Java, where they were centered, although the same divisions serve as well for all Indonesian Hindu-Buddhist art. In a third or "late" period, beginning in the 15th century, Moslem influences have become mixed with the earlier traditions.

The art of Bali, which pursued somewhat independent directions, is discussed separately, as are the minor arts, in which Moslem characteristics found their fullest expression. More recent developments under the impact of Western civilization are discussed more fully under INDONESIA and the article ORIENTAL MODERN MOVEMENTS.

See also INDIA, FARTHER.

Summary. Ancient cultures and modern tribal art (col. 42): *The monumental style. The art of the Dông-so'n culture. The ornamental styles: a. The Dông-so'n influence; b. Chinese influence of the later Chou period; c. Painting; d. Sculpture; e. Megalithic monuments and sarcophagi; f. Architecture; g. Textile art. Marginal Indonesian cultures: a. Formosa; b. Botel Tobago; c. Nicobar Islands; d. Madagascar.* Hindu-Buddhist art (col. 59): *Historical background. Religious beliefs. Evolution of the art styles. Central Javanese period: a. Architecture and its decoration; b. Principal monuments; c. Sculpture. Eastern Javanese period: a. Architecture and its decoration; b. Principal monuments; c. Sculpture.* Late period (col. 83). Art of Bali (col. 83). Minor arts (col. 85). European influences (col. 86). Conclusion (col. 86).

Ancient cultures and modern tribal art. *The monumental style.* Archaeological and linguistic evidence indicates that the original home of the peoples with Austronesian (or Malayo-Polynesian) languages lay in southwestern China and in the northern part of central Indochina, around the middle Mekong River, and that they entered Indonesia with a late neolithic culture by way of the Malay Penisula, probably in the 2d millennium B.C.

Some of the primitive stone ancestor figures of Sumatra and Java may conceivably be of the Neolithic age, but there is no way of dating them. Since the ancient artists used primarily wood and other perishable materials, it is not surprising that no single known art object can be ascribed with certainty to the Neolithic period. It is nevertheless possible to discern the probable characteristics of the neolithic art style in Indonesia on the basis of its connections with the custom of erecting megalithic monuments.

Megalithic cultures, comparable and related to those of the hill tribes of Assam and Burma, are, or were until recently, flourishing on the islands of Nias, Flores, Sumba, and Timor, on the Tanimbar Islands, in parts of Celebes, among the Kelabit of Borneo, and among some of the hill tribes of northern Luzon. As no excavations have been undertaken at Indonesian megalithic monuments, with the exception of stone cist graves in Sumatra and Java and megalithic tombs of eastern Java (all of which date from the Bronze or the Iron Age), circumstantial evidence must be utilized in order to establish the date of the introduction of the megalithic complex into Indonesia.

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

It is well known that the Munda languages of India are related to the Mon-Khmer languages of southeastern Asia, that Mongoloid racial features occur among the Munda tribes, and that their cultures manifest many traits also observed in southeastern Asia, including types of megalithic monuments and the rituals which accompany their erection. It is also in the Munda region that quadrangular and tanged stone adzes have been found, of types common in southeastern Asia but totally lacking in the rest of India. This evidence reinforces the conclusion that the migration of those who carried into India these linguistic, racial, and cultural traits originating in southeastern Asia took place in the late Neolithic. This means that at least in Assam and Burma, and probably in other regions of Indochina as well, the custom of erecting megalithic monuments must have existed already in the Neolithic period. Therefore, chronologically, there is no objection to the assumption that the megalithic complex reached Indonesia in the course of the Austronesian neolithic migration.

There are also indications of the age of the megalithic complex in Indonesia itself. The spread of megalithic cultures to the Lesser Sunda Islands, in eastern Indonesia, must have taken place before the routes for tribal migrations were interrupted by the establishment of organized Hindu-Buddhist states on the islands of Sumatra, Java, and Bali. Furthermore, the existence of megalithic monuments on those three islands and the survival there of numerous conceptions and customs derived from the megalithic complex show that in western Indonesia, too, Hindu-Buddhist civilization was preceded by megalithic cultures. This would date the introduction of the megalithic complex at least as early as the beginning of the Christian Era; an earlier, i.e. neolithic, date is suggested by the fact that those influences of Bronze Age art which are so conspicuous in most of Indonesia are either absent or of little importance in the art styles of such megalithic cultures as Nias, northern Luzon, and the northern part of central Celebes.

In order to make clear the art style connected with the megalithic complex, it is necessary to refer to the hill tribes of Assam and western Burma, where the complex has undergone fewer modifications than in Indonesia and where, above all, the style in question survives in its pure form, untouched by all those later influences which spread over most of the Indonesian islands (see ASIA, SOUTH: TRIBAL STYLES). Among the Naga and Kuki-Chin tribes of Assam and western Burma megalithic monuments (menhirs, dolmens, stone platforms) are erected, either as memorials to the dead or by wealthy men as memorials to themselves, in the course of "feasts of merit" which entail an enormous expenditure in sacrificial animals, rice, and rice beer in order to entertain the members of the clan or village. These feasts and the erection of megaliths raise the host to a higher social rank, entitle him to various privileges, and are intended not only to keep the memory of his name alive but also to assure his soul of a preferential lot after death. At the same time they are intended to promote the fertility of herds and fields and are linked to a very pronounced "wealth complex." The core of the rituals accompanying the erection of megaliths is the sacrifice of bulls, which, although the motivation for the practice varies, is thought to be particularly important from the eschatological point of view. Among some of the tribes there is a close connection between head hunting and megaliths, the heads being either temporarily deposited on stone monuments or suspended on menhirs, or a menhir being erected as a memorial for every head taken. Like the feasts of merit and the erection of megaliths, head hunting raises a man's social status and assures his soul of a better lot in the hereafter; taking of heads is thought to promote magically the fertility of the fields as well.

These beliefs are reflected in the art of the tribes concerned (I, PL. 495), which is almost wholly sculptural. Purely ornamental designs are of the simplest geometric character, quite insignificant when they exist at all, but there is an abundance of symbols carved on house fronts, village gates, and wooden monuments. There are rows of women's breasts as symbols of fertility and wealth, rosettes as symbols of the sun and the moon, weapons and rows of human heads as memorials of achievements in war and head-hunting, and innumerable bulls' heads as memorials of feasts of merit and of the erection of megaliths. The front pillars of some houses are adorned with figures of elephants, tigers, lizards, and hornbills, in relief or in the round, some displaying a simple but striking realism while others are stylized almost into geometric forms. Both these tendencies can also be observed in human figures in the round, though figures of ancestors, set on graves or memorial platforms, are always strictly frontal and are generally more or less stylized.

The ideas underlying the sculpture are exactly the same as those fundamental to the feasts of merit and the erection of megalithic monuments. Menhirs and wooden statues, or menhirs and wooden monuments with relief representations of bulls' heads, are actually interchangeable, having the same commemorative function. The motifs frequently carved in wood, particularly the ubiquitous bulls' heads, were occasionally sculptured on the megalithic monuments themselves; so close are the links between this art and the megalithic complex that both may be assumed to have been introduced into Assam and Burma at the same time, that is, in the late Neolithic period.

Since the art style was used largely for memorials, whether of ancestors or of the achievements in ritual or war by the living or the dead, it may be called the "monumental style" in the strict sense of the Latin *monumentum*. In the best works, particularly in some of the powerful and skillfully stylized bulls' heads, it is monumental also in the esthetic sense of the word. Megalithic monuments and living remnants of the monumental style are found not only in Assam and Burma but also in the central and eastern regions of Indochina; there can be little doubt that this style once extended over most of continental southeastern Asia.

In Indonesia the art styles of most tribes are dominated to such an extent by rich, curvilinear ornamental designs that they are fundamentally different from the art of the hill tribes of Assam and Burma. There are, however, a few regions where the ornamental designs did not penetrate at all or where they exercised only a slight influence. This is particularly true of the mountain region of northern Luzon and the island of Nias, but the art styles of these two areas, though undoubtedly related to that of the mainland tribes, do not lend themselves to easy comparisons. The sculptural art of the hill tribes of Luzon, almost totally restricted to the representation of ancestors (PL. 27) and other human figures, seems to have undergone a process of impoverishment; on the other hand, the art of Nias came for some time under early Indian influence and underwent what might be called a process of incipient sophistication.

More significant is a third area, in which the monumental style, with a few ornamental additions, survives almost in its pure form, that is, among the northern Toradja tribes of central Celebes. Bulls' heads and such symbols of fertility as women's breasts and male and female genitals abound in the art of these tribes, the stylistic rendering being the same as in that of the Naga of Assam. The fact that these closely related variants of a single art style are found in regions more than two thousand miles apart suggests, of course, that the style must be of considerable antiquity. In addition there are numerous indications of an earlier and far wider expansion. Single motifs corresponding to those of the continental tribes and of north central Celebes, such as women's breasts, figures of lizards and hornbills, bulls' heads, and a human figure standing between the horns on a bull's head, occur also within such highly ornamental and curvilinear styles as those of the Batak of Sumatra and the Saadang Toradja in southwestern central Celebes. The masks of the Batak show unmistakable traits of the monumental style, as do the majority of ancestor images in the non-Moslem regions of Indonesia (PLS. 27, *left*, *right*; 28). Obviously remnants of an older style, they survived within the strongly ornamentalized styles of a later period because of their religious or symbolic connotations. The inevitable conclusion seems to be that, contrary to prevailing opinions, it is not the magnificent ornamental designs of the Batak or Dayak which represent the original Indonesian art; rather, at an earlier period the Indonesians

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

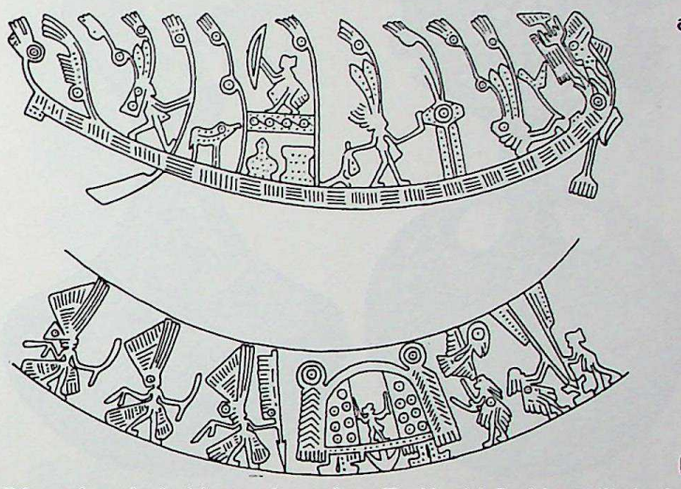
possessed a purely sculptural, monumental, and symbolic art, closely corresponding to that of the hill tribes of Assam and Burma, probably very poor (or perhaps lacking altogether) in ornamental designs. Since the curvilinear ornamental styles were introduced between 700 and 200 B.C., in the early metal age, the preceding monumental style must have been that of neolithic Indonesia. There can be little doubt that in Indonesia, as on the continent in southeastern Asia, the style was originally linked to the megalithic complex.

The art of the Dông-so'n culture. The contrast between the current art styles of most Indonesian tribes, with their wealth of curvilinear ornamental designs, and the monumental style which must have preceded them is so striking that a purely local development of the current styles from the monumental is inconceivable, and it is necessary to search for foreign influences that may have caused this complete change in style. Such influences are to be found in Chinese art of the later Chou period (ca. 7th–3d cent. B.C.), which are discussed below, and even more clearly in the art of the Dông-so'n culture, which stemmed from Yunnan and eastern Indochina. (See ASIATIC PROTOHISTORY.)

The character of Dông-s'on art can be understood only in relation to its origins. In the last quarter of the 9th and the early part of the 8th century B.C. China, which at that time comprised only the northern part of its present area, was constantly engaged in fighting the inroads of "western barbarians," a struggle which culminated in 771 B.C. in the capture of the Chinese capital by one of these tribes. The account of these troubles reflects one of those ethnic migrations which from time to time upset the political and cultural systems of the ancient world. This is confirmed by archaeological evidence. In this period new types of weapons, tools, personal ornaments, and designs, all of Western origin, appeared in eastern Asia where they were previously unknown. In them may be discerned influences of the early Iron Age cultures of the Caucasus, of the Cimmerian and Thracian areas of southern Russia and southeastern Europe, and of the Hallstatt culture of the Middle and Lower Danubian regions. Several Indo-European, as well as Caucasian, tribes must have participated in this migration. In Central Asia some of the invaders kept their ethnic identity until medieval times, while those who penetrated farther east were probably soon absorbed by the local population. Since this migration started from the areas bordering the Black Sea, it may be called the "Pontic migration." Apparently some of the invaders turned south after reaching the western borderlands of China. Following the river valleys, they reached Yunnan and northern Vietnam without passing through what was then the political and cultural area of China. They gave rise, perhaps in the 8th century B.C., to the first metal-using culture of southeastern Asia, called "Dông-s'on" after the village in northern Annam, near the border of Tonkin, where it was first identified as a distinct entity. It was essentially a bronze-using culture, but at least in its final phases iron was also known and occasionally used. Numerous Chinese imports of the later Chou and Han periods show that its bearers were in contact with China.

From its centers in Yunnan and northern Vietnam the Dông-so'n culture, or at least its influence manifested by the use of bronze, spread to Laos, Cambodia, Siam, and Burma, and eventually to Indonesia and to the northern coast of New Guinea, probably mainly from northern Vietnam and the lower Mekong region. The first Dông-so'n influences must have reached Indonesia at some time between 700 and 300 B.C. The Dông-so'n culture persisted in northern Vietnam until the country was forcibly Sinicized about the middle of the 1st century of our era. In Cambodia and southern Vietnam it must have come to an end in the 1st or, at the latest, the 2d century through the foundation of Hindu colonial kingdoms.

Dông-so'n art, as known through the decorations of numerous bronze objects, lacks all those complex and highly sophisticated designs so conspicuous in the contemporaneous art of the later Chou period of China, but shares with it some of the motifs of Western origin that were introduced in the course of the Pontic migration. There is, however, an important difference: In China these Western designs, incorporated into an already existing rich ornamental art, underwent various adaptations and modifications; Dông-so'n art, on the other hand, had been preceded in southeastern Asia by the monumental style, with its lack of ornament. Since the Western ornamental designs had no competition from indigenous ones, they were accepted with little or (in many instances) no change at all. Designs of Caucasian and Hallstatt origin predominate. The former comprise S-shaped double spirals and motifs which represent either twisted strings or strings and bands plaited from two strands. The most conspicuous among the designs derived from the Hallstatt culture are the meander in its classic form, rows of circles linked to one another by oblique tangents, rows of unconnected



Dông-so'n style, incision on drums from Tonkin: (*a*) Soul boat; (*b*) the feast of the dead (*after V. Goloubew, 1929*).

circles, saw-tooth patterns, and the so-called "ladder" pattern. A somewhat more pretentious design, a band consisting of linked double spirals, may be derived from the Cimmerian or Thracian regions of Europe.

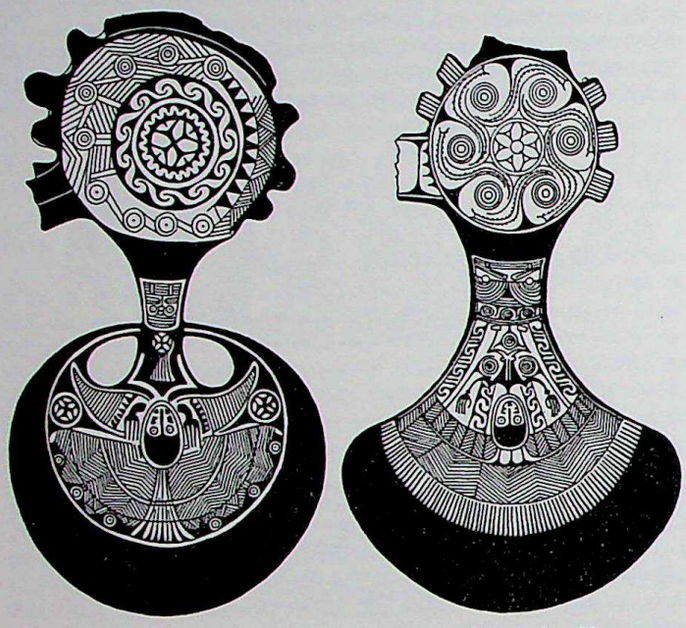
All these patterns are found on the most important works of art surviving from the Dông-so'n culture, namely, the large bronze drums or (more correctly) drum-shaped gongs, the oldest of which come from Yunnan and northern Vietnam and date probably from the second half of the 1st millennium B.C. The center of the tympanum is invariably marked with a large star. This is surrounded by concentric zones, some of which are filled with ornamental designs, while others show rows of birds or quadrupeds. The larger and more elaborate drums have one zone depicting houses, dancing men wearing large feather headdresses, and musicians playing mouth organs or beating drums, scenes which probably represent either the great annual feast in memory of the dead or the life of the souls in the hereafter. On the bulging upper side of the drums are pictures of boats, manned by crews wearing feather headdresses; on the basis of comparisons with recent paintings from Borneo this motif has been identified as a representation of the boat which is thought to carry the souls of the dead to their final abode (FIG. 46; see also ESCHATOLOGY).

Bronzes of the Dông-so'n culture and the contemporaneous stone sculptures and grave paintings of the Pasemah plateau of southern Sumatra (PL. 25) are the oldest Indonesian art objects that can be definitely ascribed to a particular period. Some of the Dông-so'n bronzes found in Indonesia, however, were not local products but must have been imported from Indochina. This is the case, for example, of a bronze vessel of unusual shape from the island of Madura and of a similar one from Sumatra; both are apparently imitations of baskets, and both are decorated with spiral designs. In addition the neck of the one from Madura has rows of magnificently stylized figures of deer and peacocks. Its continental origin is indicated by the finding in Cambodia of a vessel of identical shape and decoration. Some bronze drums found in Java and Sumatra are so similar to the oldest types of northern Vietnam that they may be as-

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

sumed to have originated there. Eastern Indonesia is particularly rich in ancient bronze drums imported from Indochina. These show, however, some deterioration of the original designs of plumed warriors and, at the same time, greater sophistication in the figures of men and animals which are of types not found on the oldest drums and reveal Chinese and Indian influences. They obviously date, not from the Dông-so'n period proper, but from the first centuries of the Christian Era, when the coastal regions of eastern Indochina were already under Chinese and Hindu domination.



Bronze axes from Roti (*after J. Teillers, Ethnographica in het Museum van het Bataviaasch Genootschap van Kunsten en Wetenschappen, 1910*).

The art of bronze casting was introduced into Java and Bali, and probably into other islands as well. Casting molds for socketed axes and lance heads have been found in Java. On some of the islands bronze tools, weapons, and bracelets of the Dông-so'n period occur in fairly large numbers, but works of art of indubitably local origin are few. The most important work is a bronze drum kept in a temple at Pedjeng (Bali), which differs from the drums of the mainland not only in its enormous height (ca. 6 ft.) but also in its shape and decoration. It is undoubtedly a magnified equivalent in bronze of the wooden drums of hourglass shape still in use on various Indonesian islands. The star in the center of its tympanum is surrounded by broad curvilinear bands derived from spirals, while its sides are decorated with stylized heart-shaped human faces. Several tympanums of similar drums, as well as stone molds for casting drums of this type, have been discovered in Java and Bali. The type survives in the *mokkos*, bronze or brass drums of hourglass shape which until the 20th century were used as currency on the island of Alor (see COINS AND MEDALS; III, PL. 416).

An enormous bronze socketed ax from Celebes, apparently ceremonial, is decorated with a stylized human face and with ornamental designs of Dông-so'n character. Three ceremonial axes from the small island of Roti, with blade and handle cast in one, excel in their rich decoration, including tangent circles, spiral bands, stars, whorl motifs, and stylized human figures (FIG. 47). A curious type of battle-ax, apparently ceremonial, is peculiar to Java; its large crescent-shaped blade and short handle are cast in one piece, while its decoration comprises fantastically stylized bird figures and small S-shaped double spirals.

A few small bronze figures of men and animals in the round, found in Java, have been tentatively ascribed to the local branch of the Dông-so'n culture. A bronze find made at Kuwu (Sumatra) contained 4 bracelets with decorations in Dông-so'n style and 14 small human figures representing men with extended arms. The latter are remarkably similar to several from the early Iron Age Koban culture of the Caucasus; one Sumatran and one Caucasian figure share even such a very special detail as a horizontal S-shaped double spiral on the body.

Despite their small number, these and a few other bronzes indicate that the continental models were not simply copied but that local variants of Dông-so'n art developed in Indonesia. Such characteristic motifs of far Western origin as double spirals, spiral bands, plaited strings, and tangent circles are still present, but they are combined in a way different from that found in Indochina; moreover, new and original designs were added, such as the stylized bird figures on the ceremonial axes from Java and the heart-shaped faces on the drum of Pedjeng.

Apart from the art of bronze casting, there are good reasons to assume that the innovations introduced into Indonesia during the Dông-so'n period also included various artistic activities using perishable materials, goldwork, the art of weaving, certain house types, a type of plank-built boat, and, apparently, some new religious conceptions and rituals, as well as the custom of burying the dead in urns or stone cists.

The relation between the ornamental designs of the Batak, Dayak, and other modern Indonesian tribes and those of the Dông-so'n culture of northern Vietnam was first pointed out by V. Goloubew in 1929. He concluded that the Indonesians had created the Dông-so'n culture prior to their emigration from the continent and eventually introduced it into the archipelago. This erroneous notion was so widely accepted that it seems to be ineradicable. Archaeological and linguistic evidence shows that the Indonesians came, not from the coast of northern Indochina, but from its interior by way of the river valleys and the Malay Peninsula, and with a neolithic and not a bronze-using culture. Moreover, Chinese reports make it clear that when northern Vietnam first appeared in history in the 3d century B.C., it was inhabited not by Indonesians but by the ancestors of the modern Vietnamese. It may therefore be assumed that the spread of the Dông-so'n culture and art to Indonesia was largely due to the ancient Vietnamese; various facts indicate that these people must have been keen mariners. Other contemporaneous movements, originating among the peoples on the lower Mekong and perhaps also among those of Siam and Burma, all speakers of Mon-Khmer languages, may have contributed to a certain extent to the expansion of Dông-so'n influences in the islands. In no instance, however, can there have been a question of large-scale migrations, but rather of small groups of immigrants which, while exercising a profound influence on local culture, were soon absorbed by the local populations. To a certain extent the manner in which the Dông-so'n culture spread to Indonesia may be compared to that of the expansion of the Indian civilization that followed it in the first centuries of the Christian Era.

The Dông-so'n style must have deeply impressed the peoples of Indonesia, precisely because of their former dearth of pure ornament. Its arrival seems to have resulted in a sudden flowering of decorative art; the few ancient objects so far found give the merest indication of this phenomenon, but its results survive in the recent art styles of Indonesian tribes.

The ornamental styles. The term "ornamental styles" has been chosen here to indicate the art styles of Indonesia in which ornamental designs predominate, with the exception, however, of those of the Moslem peoples and of Bali, the decorative designs of which are in the main derived from the art of the Hindu-Buddhist period.

The character of the ornamental styles is in every respect opposite to that of the monumental style which preceded them. This fundamental difference concerns not only outward stylistic aspects but the very meaning of the art. While the monumental style was used almost exclusively in memorials and symbols, the ornamental styles are applied not only in religious art but also in the purely esthetic decoration of secular objects.

The ornamental styles prevail in the following areas: the Batak region of Sumatra; the Mentawei Islands; Borneo, with the exception of the Moslem coastal regions; Celebes, with the exception of the Moslem regions (in the northern part of central

UP State Museum, Lucknow

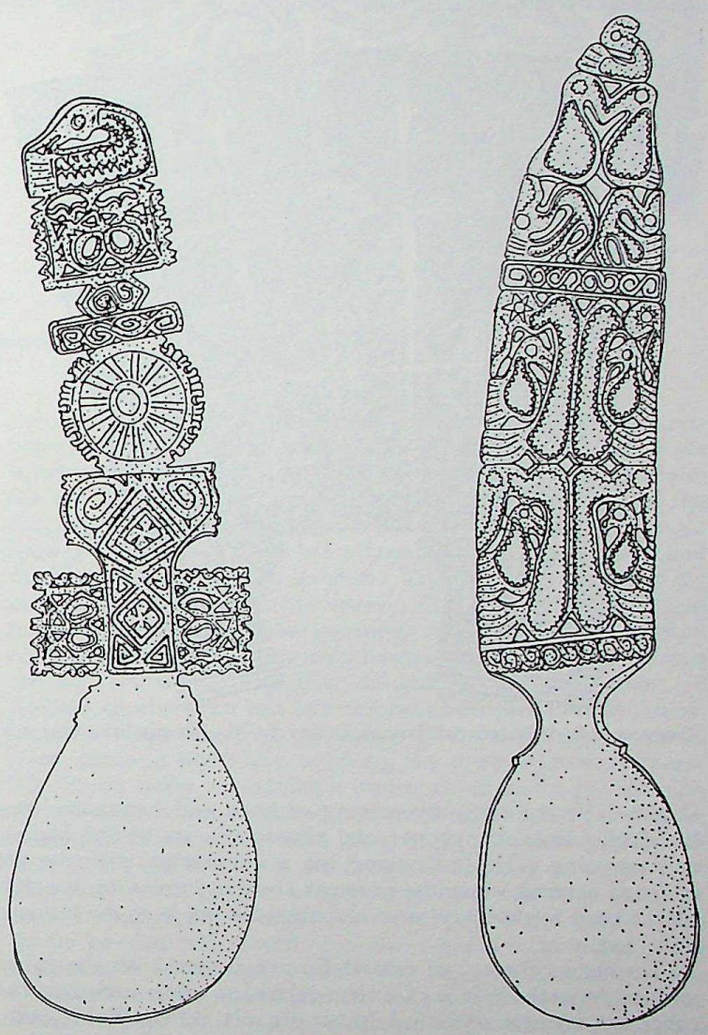
CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

Celebes, however, mixed with the predominant monumental style); most of the Moluccas and of the southern island chain from Flores and Sumba to the Tanimbar Islands; and the territory of the primitive tribes of Mindanao, particularly the region around the Davao Gulf. Stray motifs of the old Indonesian ornamental styles survive also in the arts of most Moslem peoples, particularly in those of Menangkabau in Sumatra and of the Moro in the Philippines, but also in Java. On the other hand, through Malayan and Javanese influences, patterns of Indian derivation were adopted into many local variants of the ornamental styles. In some instances the two stylistic groups blend into each other so that it is difficult to draw a dividing line. It may be assumed that, in one way or another, all ornamental styles of Indonesia are derived either from the art of the Dông-so'n culture or (as in the case of central Borneo and central Flores) from that of later Chou China. However, the degree of affinity varies; in some instances a direct derivation from Dông-so'n art can hardly be doubted, while in others Dông-so'n influence may have penetrated indirectly and long after the Dông-so'n culture itself had vanished.

a. The Dông-so'n influence. Since knowledge of the ornamental art of the Dông-so'n culture is derived wholly from bronzes, the survival of its stylistic tradition may be most easily recognized in metalwork. It is true that bronze has been superseded by brass, that the shapes of most modern objects differ from those of the Dông–so'n culture, and that different motifs have been added. Batak brass objects, for example, are frequently adorned with representations of bulls' heads and lizards adopted from the old monumental style. Nevertheless, such characteristic designs as the S-shaped double spiral, the twisted string, and the two-strand plaited string are so conspicuous as to leave no doubt concerning the Dông-so'n origin of Batak metal art. The same applies to brasswork from central Celebes, to Batak gold jewelry, and to gold ornaments from the island of Flores.

Dông-so'n ornamental designs are by no means restricted to metalwork. They are found on all kinds of materials: wood, bamboo, textiles, and even on megalithic monuments. Thus S-shaped double spirals are found in almost all local branches of the ornamental styles. They appear singly, in rows, or in the form of heart-shaped designs consisting of two spirals opposed to each other. Rows of triangles in saw-tooth patterns play an important role as border designs, as on the ancient bronze drums. While designs based on the spiral or derived from it are ubiquitous, the more elaborate ones have no counterparts in the decoration of the ancient bronzes, which cannot match the magnificent scrolls of Tanimbar ivory combs, or the delicate and intricate designs of Batak (PL. 23), Tanimbar (PL. 26), and Ceram wood carvings, with their fantastic interlacery of bands and spirals. This wealth of highly complex designs is probably due only in part to local developments. The nature of Dông-so'n wood carving is unknown, but there is every reason to assume that its designs were far more elaborate than those on the metal objects. It is evident that for technical reasons the ancient metallurgists were forced to restrict themselves to the reproduction of the simpler motifs, just as among modern Indonesian tribes the designs in metalwork are simpler than those used in wood carving. In Indonesian ornamental styles a phytomorphic aspect is frequently given to spirals and bands of connected spirals by the addition of small tendrillike appendages. The decorations of at least one bronze dagger hilt from Dông-so'n show the same peculiarity and seem to reflect a tendency that must have existed in Dông-so'n wood carving.

The diversity of Indonesian ornamental styles and the puzzling problems they pose may be exemplified by conditions in eastern Indonesia. While the art styles of Ceram, Alor, and the Tanimbar group are completely dominated by spirals and their derivatives, in central Celebes and on the islands of Timor and Sumba, side by side with spirals and other curvilinear designs, are found a wealth of purely geometric motifs, mainly in wood carving and bamboo decoration, but also in ornaments carved on megalithic tombs in Sumba (PLS. 24, 25) and, in the northern part of central Celebes, in painting on bark cloth. This mixed curvilinear and geometric style finds its richest expression in the carved and painted decorations of Saadang Toradja houses in the southwestern part of central Celebes (PL. 23). Such designs as meanders, rows of triangles, and rows of circles are certainly of Dông-so'n derivation. For some reason the geometric, nonspiral elements of Dông-so'n art seem to have appealed to these tribes; even some curvilinear designs of Dông-so'n origin, such as the plaited band, have become rectilinear and angular. Other motifs clearly were adopted from the monumental style, even when in modified form. Thus the bull's head survives in its original character in the wood carvings of the northern Toradja and even on the front posts of Saadang Toradja houses, and appears at the same time in flat relief and painting in a stylized ornamental version. Finally, these styles, particularly that of the Saadang Toradja, are rich in flower patterns of Indian origin, which must have been copied from Javanese, Malayan, or Bugi textiles.



Decorative art of Timor; horn spoons with openwork ornament.

Bamboo is a major art medium in Indonesia; some of the finest designs are found on cylindrical receptacles for tobacco, lime, and the like. Though occasionally produced by pyrography, such designs are generally created either by incision or by cutting away portions of the outer layer of the bark so that the untouched parts form the design. In order to make the design stand out more clearly, the surrounding surface is frequently colored either black or red. In general, the designs conform more or less to the local ornamental style. Only in the western part of Timor is a completely different, geometric and floral style used in the decoration of bamboo receptacles; but in this case, according to the natives' own testimony, they were inspired by the patterns of imported Javanese textiles.

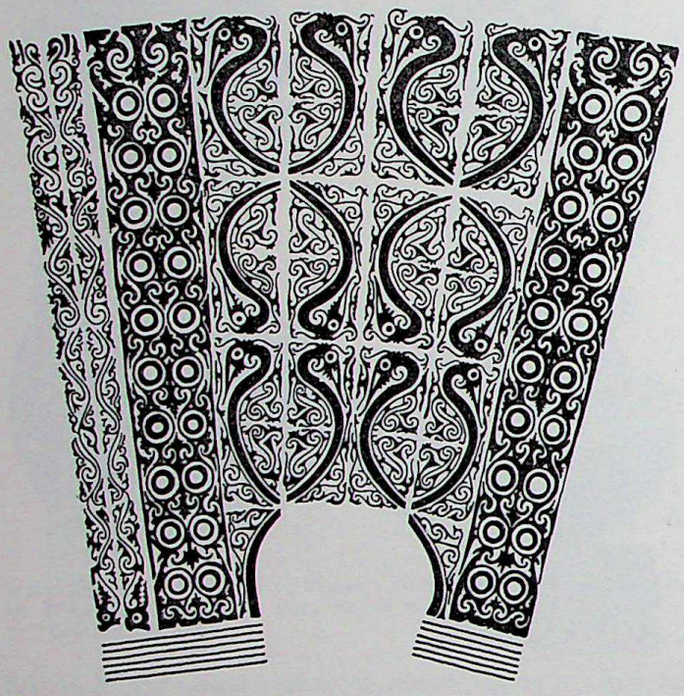
b. Chinese influence of the later Chou period. Among all the ornamental styles of Indonesia, that of some tribes of central Borneo is outstanding. Its main bearers are the Kayan and Kenyah on the upper reaches of the Kayan, Mahakkam, and Kapuas rivers and in the interior of Sarawak. The style is seen also in several other tribes, but with present knowledge it is not possible to delineate the exact area of its expansion. In former times it may have reached as far as the coast. The techniques in which it finds expression comprise wood carving, bamboo decoration (FIG. 53), painting on house walls and



Tattoo motifs from central Borneo (*after A. W. Nieuwenhuis, 1904–07*).

shields (IV, PL. 175), the carving of bone and hartshorn, embroidery, beadwork, copper and silver inlay on sword blades, and tattooing. The last named has a connection with the art of wood carving, since the patterns are first carved on wooden blocks used to stamp color on the skin as a guide to the tattooer (FIG. 51).

Insofar as the art of central Borneo is based on the spiral and its derivatives, it is of course related to some extent to the other ornamental styles of Indonesia. It differs from them, however, in its greater freedom from symmetry, in the variety and intricacy of its patterns, in the extreme delicacy of its lines, and, above all, in its masterly integration of different motifs into an organic and harmonious over-all design. Comparison of some of these designs with the strictly symmetrical arrangement of ornaments in Tanimbar carvings, with the rich but repetitious designs from Ceram, and with the mechanical side-by-side placement of disparate and unconnected motifs in the art of the Saadang Toradja of Celebes reveals the very different spirit that prevails in the art of central Borneo. Not even the magnificent ornamental carvings of the Batak can match their refinement and artistic freedom.

The art of central Borneo lacks all those basic and most characteristic Dông-so'n designs which are so important in the rest of Indonesia, such as the simple S-shaped double spiral, the twisted string, the two-strand plaited string, the plaited band, and the saw-tooth motif. Instead it is dominated by spiral designs and particularly by a zoomorphic motif, the so-called "dog" (*aso*), which is well-nigh ubiquitous in central Borneo, although it is unknown in the rest of Indonesia. It appears in the decoration of bamboo objects, in wood carvings, in the decoration of house walls, on painted shields, in tattoo patterns, and even in beadwork, embroidery, and appliqué on textiles. *Aso* figures are placed on the roofs of houses and on graves. The *aso* is always stylized and highly ornamentalized, its wide-open jaws ending in hooks or scrolls. There is a strong tendency for the whole figure to disintegrate into mere ornamental designs. The figure may lose its legs, the elongated body taking on the aspect of a serpent or dragon; frequently the body disappears completely, leaving only the head with its large eye and hooked jaws. The surface of bamboo receptacles and of panels on the interior walls of houses may be covered with a fantastic maze of spirals and curved lines interspersed with *aso* heads. The variety of designs derived from this single motif is endless.

The fundamental differences between the art of central Borneo and the ornamental styles of the rest of Indonesia cannot be due merely to divergent local developments; they indicate a difference in origin. An art style of such refinement and sophistication could not possibly have developed independently in the cultural surroundings of central Borneo without an initial stimulus from the art of some higher civilization. This hypothetical parent style must have shared some traits with that of the Dông-so'n culture, but it must have possessed far more complex designs as well as certain zoomorphic ornamental motifs foreign to the Dông-so'n style. These traits are to be found in Chinese art of the later Chou period. (Cf. CHINESE ART, *Chou period.*)

Between the art of central Borneo and that of the later Chou period there was a gap of more than two millenniums, during which there must have occurred considerable change due to local developments and to adaptation to the cultural surroundings. Moreover, apart from some lacquer paintings on wood, the decorative art of later Chou China is known only through objects of metal and jade; as pointed out in other connections, the use of different materials of course necessitates some difference in designs. At present the characteristics of later Chou ornamental wood carving are not known; equally unknown are the designs then applied in tattooing, which, according to literary sources, was practiced by some of the ancient peoples of southern China. Despite this lack of knowledge, it can be shown that to a considerable extent the art of central Borneo and later Chou art are similar in general character and share a number of highly specific traits and motifs, only a few of which can be listed here.

The stylistic similarity between the patterns of Borneo and those inlaid in silver or gold on later Chou bronze objects is particularly striking. In the latter a thin line running parallel to the contour of the main design adds frequently to its daintiness and grace. Even this trait, apparently minor but in fact highly characteristic, appears in the wood carving of central Borneo and particularly in designs on bamboo (FIG. 53). A Bornean tattoo pattern consisting of a comma-shaped design with the head of a hornbill on its upper end (FIG. 51) has a counterpart in silver inlay on a Chinese bronze. But it is particularly in the *aso* motif that Chinese influence comes clearly to the fore. A variety of the *aso*, with its head turned backward and the whole figure having the aspect of a horizontal letter S, corresponds closely to Chinese jade carvings which are interpreted as representing tigers or, perhaps, leopards. Two opposed *aso* figures sharing a common head, as well as a broad S-shaped band with an *aso* head at each end, may be compared to well-known Chinese motifs. Finally, decisive evidence is provided by a variety of the *aso* in which one hind leg protrudes above its back. This grotesque design may be understood only by a comparison with the curiously twisted animal figures on Chinese bronze mirrors, dating from the 4th and 3d centuries B.C., according to Karlgren. The heads and necks of these fantastically stylized figures, representing either tigers or dragons, are shown in profile, while the body is seen from above with the legs spread on both sides.

In summary, it may be concluded that the *aso* designs are derived from Chinese motifs. This, however, does not exclude the possibility of some influence derived from Hindu-Buddhist naga figures in the serpentlike versions. Hindu-Buddhist influence is beyond doubt perceptible, also, in the magnificently carved sword hilts of wood or hartshorn. Many among them show a human figure either on a *makara* or seated on a demonic head; the latter was originally a scene from the Buddhist *Sutasoma-Kalmāṣapāda* legend, representations of which were

UP State Museum, Lucknow

Designs on bamboo containers from central Borneo (*after A. W. Nieuwenhuis, 1904–07*).

widely used as warrior charms in southeastern Asia. Certain details indicate that these motifs were probably introduced in the 14th century, when Borneo lay under the political supremacy of the Javanese kingdom of Majapahit. The motifs were adapted to the local style, however. Ornamental lines spread like roots or creepers over the bodies and faces of the figures, in many instances completely dissolving the latter into a tangle of hooks and scrolls.

Like the ornamental art of central Borneo, that of the Ngada in central Flores seems to be of Chinese later Chou origin; the carvings on Ngada house fronts and sacrificial posts, interlacing scrolls with the same characteristic double contours as in China and Borneo, are remarkably similar to some designs in inlay on Chinese bronze objects.

The Chinese influences that stimulated the development of the art of central Borneo and of the Ngada may be dated approximately to the 4th century B.C., more or less contemporaneous with the spread of the Dông-so'n culture in the archipelago. Since archaeological research on the islands of Borneo and Flores is only beginning, it is not surprising that no Chinese objects of the period in question have been found there. Moreover, it is conceivable that no Chinese art objects of such durable materials as bronze or jade were ever exported to Indonesia, but that later Chou influences were introduced by small groups of people from the coastal regions of China, who settled in the islands for commercial or other reasons and there produced their traditional designs in wood or bamboo. Precisely in this manner, and through the medium of nondurable materials (wood, bamboo, textiles), Malayan and Javanese ornamental designs of Indian origin spread in more recent times to many tribes in Borneo, Celebes, and eastern Indonesia.

c. Painting. The many-figured festive scenes and representations of the soul boat on the ancient bronze drums of the Dông-so'n culture (FIG. 46) cannot have been created solely to be cast in bronze; they must have been preceded by similar scenes painted on wood or some other material. This suggests the possibility that the paintings of human and animal figures, boats, and the like, found in the Mentawei Islands and among the Batak of Sumatra, the Ngadju in the interior of southeastern Borneo, and the Saadang Toradja of Celebes may be derived from this hypothetical painters' art of the Dông-so'n culture. (It is significant in this connection that many-figured paintings representing myths and legends adorn the walls of men's houses on the Palau Islands, the one Micronesian group which, as its house forms and certain ornamental designs testify, was reached by Dông-so'n influences. See IX, PL. 543.)

The most adequately known pictorial works are those of the Ngadju of Borneo. Painted on large boards, they represent the land of the dead, the celestial tree said to have precious textiles as leaves and to bear agate beads as fruits, the boats in which the gods are thought to travel, and the boat in which the god Tempon Telon is believed to conduct the souls of the deceased to their final abode. The soul boat, called *banama tingang* ("hornbill boat"), has a hornbill's head on its prow and the bird's tail feathers on its stern. The mast is a version of the celestial tree with its textile leaves. The close correspondences between these Ngadju boat paintings and the boats represented on one of the oldest Dông-so'n bronze drums was first pointed out by Goloubew. The boat designs on the drum have tail feathers on the stern but lack the hornbill's head on the prow, its place being taken by the figures of hornbills coming down from above in flight and touching the prow with their beaks. The boat's cabin, containing a bronze drum and a precious jar, corresponds to the cabins of Ngadju boat paintings, with their cargoes of bronze gongs and precious jars, funeral gifts to the dead, while the archer on the drum, discharging an arrow from the cabin's roof, has his counterpart in the paintings in a man who is discharging a cannon on the roof of the cabin. This shows beyond any doubt that the Ngadju boat pictures are modernized versions of a motif that must have existed in the Dông-so'n culture even before it was reproduced on the bronze drums. There is, however, a marked difference in style. The warriors forming the boats's crew on the drum are shown in a simple, realistic manner. In the Ngadju paintings the god Tempon Telon and his companions are curiously stylized; their arms, hands, and legs resemble the legs of beetles rather than human limbs. Similarly stylized human figures, with limbs like those of beetles, occur in the paintings on the walls of Toba Batak houses and in the illustrations of Batak manuscripts (X, PL. 64). Since the possibility of any direct contact between the Batak of Sumatra and the Ngadju of Borneo can be ruled out, they must have derived this stylistic trait from some common source. A Chinese manuscript on silk, found in a tomb at Ch'ang-sha in the province of Hunan and tentatively dated to the 4th century B.C., indicates a possible source. The illustrations show demonic figures of practically the same style as those of Ngadju paintings, also with limbs resembling those of beetles. It may be that the Ngadju paintings, while originally of Dông-so'n derivation, were later modified by Chinese influences; it is equally conceivable that, except for the different stylization of human figures, the motif of the soul boat existed in later Chou Chinese painting in the same form as in the Dông-so'n culture, and that it was introduced into Borneo from China.

No trace of Chinese influence is found in the scenes painted on the beams and walls of houses of the Mentawei Islands, of the Karo Batak and of the Saadang Toradja (nor in the paintings of the Palau Islands in Micronesia); these have a simple realism

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

and may represent the original painters' style of the Dông-so'n culture. Some of the magnificent drawings of the Ot Danom on the upper reaches of the rivers of southern Borneo, incised into the surfaces of bamboo receptacles, represent the great feast in honor of the dead, with the celestial world shown above and the nether world below this central scene. Although far more elaborate, the latter deal with the same subject as do the representations of feasts on the tympanums of some of the oldest bronze drums. It seems possible, therefore, that these Bornean drawings are distantly rooted in Dông-so'n traditions.

d. Sculpture. The ancestor figures of wood (PLS. 25, 27) or, more rarely, of stone — whether in seated position or standing, whether boldly simplified with almost geometric features or more realistic and rounded in form — perpetuate for the most part the ancient monumental style that preceded the Dông-so'n. In the eastern islands, for instance in the Tanimbar group, parts of the surfaces may be covered with ornamental designs without, however, affecting the character of the sculptures themselves. It is only among the Batak of Sumatra and in Borneo that a more complicated situation is found.

In the carvings on Toba Batak houses (PL. 23) occur typical motifs of the monumental style, such as women's breasts and figures of lizards, side by side with sculptures that not only are covered with ornamental designs but have in themselves become ornaments. Ornamental versions of buffalo heads and of squatting human figures are so stylized that in many instances their basic form becomes hardly recognizable. It is difficult to tell whether this is due to the influence of the local ornamental style or to stimuli received from Hindu-Buddhist art, or, as seems most likely, to both. Foreign influences, mostly Hindu-Buddhist, are noticeable in some other sculptures, ancestor and protective figures of wood and stone, and masks, but the majority conform in essence to the monumental style. The so-called "magic wands" or priests' staffs, with numerous human and animal figures superimposed one upon the other (PL. 26), pose a special problem. They are probably derived from a very ancient style of eastern Asia, elements of which seem to have survived in China until the 1st millennium B.C. and may have been carried south in the Dông-so'n period.

In central Borneo the wooden statues intended to give protection against diseases and other ill fortune show the traits of the monumental style; at the same time ornamentalized human or demonic faces are carved on house posts, on the pillars supporting sepulchral huts, and on objects of daily use (PL. 42). Some of the memorial monuments of southern Borneo have numerous human and animal figures superimposed upon one another (PL. 26). They seem to be related in style to the Batak magic wands and may be of the same origin. The masks of central Borneo (PL. 29), representing fantastic demons of truly nightmarish quality, are typical products of the local ornamental style and differ fundamentally from the far simpler masks of the rest of Borneo.

e. Megalithic monuments and sarcophagi. In some areas of Indonesia even the megalithic monuments came under the influence of ornamental tendencies. This is particularly the case on the island of Sumba. Most of the tombs there consist of huge monolithic receptacles in the shape of the frustum of a pyramid covered with a large stone slab. In some instances the decoration consists merely in relief representations of bronze gongs, as symbols of wealth, and buffalo horns. Others are covered with rich ornamental designs of Dông-so'n derivation, interspersed with relief figures of horsemen or with such motifs of the old monumental style as lizards. Frequently the head of a buffalo is carved on one end of the covering slab and the animal's tail indicated at the opposite end. The whole tomb thus becomes a stylized buffalo figure, occasionally carrying on its back human figures of stone (PL. 24). This conforms to the old megalithic belief in the eschatological importance of the buffalo sacrifice. The simple menhirs of former times are replaced by even more fantastic monuments, richly ornamented, their sides carved into freely projecting scrolls or adorned with reliefs of men and animals, and frequently surmounted by full-round figures of horsemen or birds (PL. 25).

Other instances of the development of stone sculpture within the ornamental styles of Indonesia include the house-shaped sarcophagi of the Minahassa district of northern Celebes, many of them richly decorated, and the sarcophagi of the Toba Batak (PL. 24), conforming to the local house type and with a large, magnificently stylized human face at one end.

f. Architecture. Three Indonesian house types of real artistic merit, all more or less related to one another, may be assumed to have been introduced during the Dông-so'n period. One of them, represented on the oldest bronze drums, has a saddle-shaped ridge with the ends protruding beyond the front and rear walls of the house, thus giving the roof the shape of a boat. This type survives in its purest form in the houses of the Toba Batak of Sumatra and those of the Saadang Toradja of Celebes. In the second type the roof consists of two parts, a lower hipped roof and above it a boat-shaped roof corresponding to the first type. Its antiquity in eastern Asia is attested by its representation on the oldest bronze mirrors from Japan. This second type occurs among the Karo Batak of Sumatra, where it has given rise, probably under Hindu-Buddhist influence, to even more complex storied roof forms (PL. 23). The third type has a multiplicity of boat-shaped roofs, linked horizontally as if telescoping into one another. There are indications that this type was also formerly widely distributed in eastern Asia; it survives in the wooden Buddhist architecture of Burma and Siam. In Indonesia it is restricted to the Menangkabau region of Sumatra (PL. 23).

g. Textile art. Textiles decorated by the *ikat* technique rank among the most attractive works of Indonesian art. In this technique the pattern is produced by tie-dyeing, not on the finished tissue, but before weaving, either on the warp or the weft or, occasionally, on both. Before immersion of the threads in the dye those portions which are not to be colored are wrapped with leaves or fibers, and this process is repeated for every color.

Except for the tread-looms of Indian derivation which are used in a few localities in Java and Sumatra, all Indonesian looms of whatever model are worked by hand, the warp being stretched with the help of a belt around the weaver's back. Cotton, certainly introduced from India in the first centuries of the Christian Era, is today the most common weaving material, but various kinds of indigenous plant fibers (*Musa textilis*, *Borassus flabellifer*, *Pandanus*, and others) are still being used on a number of islands.

The textile designs of Indonesia (PLS. 40, 41) may be roughly divided into two major groups. The first, characterized by flower patterns and their geometric derivatives and by stylized plant motifs, corresponding to the designs of textiles represented on ancient Javanese monuments, are obviously of Indian origin. Accordingly the patterns of this group predominate on the tissues of the Javanese, Malays, Balinese, Buginese, and others who were formerly within the realm of Hindu-Buddhist culture, or who at least came under its influence; they were adopted only to a slight extent by primitive tribes, occurring chiefly on some of the Lesser Sunda Islands.

The second group of designs, completely different, owes nothing whatsoever to Hindu-Buddhist art. Apart from a few simple patterns of technical origin this group comprises spirals and their derivatives, as well as human and animal figures. For the sake of convenience this second style of textile design may be termed "old Indonesian." It is found on the tissues of the Batak of Sumatra, of the primitive tribes of Borneo and Mindanao, of the Toradja of Celebes, and among most primitive tribes of the Lesser Sunda Islands, the Moluccas, the Tanimbar Islands, and elsewhere. It is significant that old Indonesian designs occur side by side with those of Indian origin on Malayan, Javanese, and Balinese fabrics, where they can only be survivals from an earlier period. They prove that the old Indonesian style of textile decoration, and consequently also weaving and the *ikat* technique, were known in Sumatra,

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

Java, and Bali prior to the establishment of Indian colonial cultures on those islands. However, this concerns only the warp *ikat* technique, the only one known to the peoples where the old Indonesian style prevails. Weft *ikat*, as found among Malays, Javanese, Balinese, and the Moslems of Lombok and northern Celebes, certainly came from India, where it is still practiced.

No indication as yet has been found that weaving was known in the Neolithic period; of course this is not positive proof to the contrary, but it seems likely that the neolithic Indonesians used only bark cloth, as some tribes do even today. Under no circumstances could the rich ornamental designs of Indonesian *ikats* have been derived from the neolithic monumental style with its dearth of ornament. From the foregoing it follows that warp *ikat* was introduced into Indonesia neither in the Neolithic nor in the Hindu-Buddhist period. Since the *ikat* technique is, or was, widely diffused throughout southern, central, and eastern Asia, the possibility that this technique came to Indonesia with the spread of the Dông-so'n culture must be considered. It is known that the bearers of the Dông-so'n culture in northern Vietnam practiced weaving, for remnants of textile wrappings adhere to some of the bronzes excavated at Dông-so'n. The nature of these tissues is not known. However, the spiral designs in the patterns of Indonesian *ikats*, which include the characteristic S-shaped double spiral, are unmistakable proof of Dông-so'n influence. Of course the weavers of the Dông-so'n period could have used only plant fibers, the material still employed in Mindanao and various other islands.

Limitations of space preclude a full survey of the wealth of Indonesian textile designs. Outstanding among them are those of Mindanao, of the Iban of northwestern Borneo (PL. 40) and some tribes of eastern Borneo (with a puzzling gap in central Borneo), of the western Toradja of Celebes (PL. 41), of the Batak of Sumatra, and of the islands of Sumba (PL. 40) and Timor. Human figures and figures of crocodiles are conspicuous by their wide distribution. In some instances they have been so stylized that they are recognizable only on the basis of detailed comparisons. On Batak *ikats* the crocodile figures have been reduced to mere lozenges, while some apparently purely geometric designs of western Toradja *ikats* have been shown to be derived from a pattern of interlinked human figures.

Future research will, no doubt, disclose subgroups of more closely interrelated textile styles. Even a superficial glance will show that some special relation exists between the style of Mindanao and that of the Iban, to which Timor *ikats* also manifest a fairly close relationship. Batak *ikats*, while sharing numerous single motifs with those of the islands farther east, differ from them in general character. In a class by themselves are some of the magnificent *ikats* of Sumba, which are characterized by figures of men, deer, horses, birds, serpents, and marine animals and by representations of stylized trees with human skulls fastened to their branches (PL. 40).

While some *ikats* serve as everyday or festive clothing, others are used only as ceremonial gifts at weddings and other celebrations. Larger and more elaborate specimens frequently are kept as heirlooms and used as wall decorations on festive occasions. The very large *ikats* of the western Toradja serve as shrouds, and those of Sumba as funerary gifts. Such motifs as human and crocodile figures indicate an association with some kind of religious symbolism, even though the original meaning may have been forgotten.

Ceremonial and religious connotations adhere also to a completely different class of textiles, found in the Kroë and Lampong districts of southern Sumatra. There are two varieties, embroidered ceremonial clothing and large cloths woven with floating weft that are used as ceremonial hangings. Both display the soul boat (X, PL. 431), human and animal figures, and the celestial tree. Their motifs are related to the paintings of the Ngadju of Borneo. Such ornamental designs as spirals indicate beyond any doubt that they are derived either from Dông-so'n or later Chou Chinese art.

The technique of basketry, with its remarkably refined products (II, PLS. 228, 229, 231, 234), is discussed in the article on BASKETRY.

Marginal Indonesian cultures. a. Formosa. A highly specialized variety of the monumental style exists among the Paiwan, the southernmost of the tribes with Indonesian languages who inhabit the mountain region of Formosa. Their works of art include human statues, as well as reliefs with human and animal figures, human heads, and snakes carved on wooden house beams and lintels, on menhirlike slabs of slate, and on knife sheaths, wooden vessels, and drinking cups. A few reliefs of the same style occur among the Rukai, near neighbors of the Paiwan. The art of the other hill tribes is of little importance.

b. Botel Tobago. The ornamental art of the Yami, inhabitants of the small island of Botel Tobago east of the southern tip of Formosa, is applied mainly to the decoration of boats. The designs consist of rows of triangles, zigzag lines, and human figures; the last have extended arms which end in spirals in place of hands. A circle enclosing a star is inscribed on either side of the boat near the bow. Plank-built boats of the same shape and the same unusual type of construction occur in the Solomon Islands, where they are decorated with similar designs. In general, the ornamental styles of Botel Tobago and of the Solomon Islands seem to be closely related. This is not due to Melanesian influences in Botel Tobago, as has been supposed, but, on the contrary, to Asiatic influence in the Solomons. The spirals and the rows of triangles used as border designs, very much the same as on the ancient bronze drums, indicate the Dông-so'n origin of the Yami style. Moreover, it is practically certain that the very special type of plank-built boat used in Botel Tobago and in the Solomons was introduced into eastern Asia in the Dông-so'n period. However, since Yami art differs from the ornamental styles of Indonesia, one must conclude that its development was stimulated by a separate wave of Dông-so'n influences from the mainland.

c. Nicobar Islands. In view of the geographical proximity of this archipelago to Sumatra and the affinity of its culture to that of Engano, it is not out of place to devote a few lines to its art, even though the Nicobarese language is not Indonesian but belongs to the Mon-Khmer family. Nicobarese sculptures, carved of soft wood, are intended to drive off evil spirits. The human and animal figures excel in their lively realism (PL. 27). It is difficult to determine their place within the general framework of Indonesian art history. Paintings on wooden boards or on the sheaths of palm leaves are suspended in the houses in order to give protection against the spirits of disease. The representations include men, animals, dances, legendary beings, houses, ships, sun, moon, and stars, and the like (PL. 39), executed in a simple, realistic style resembling that of Mentawei, Saadang Toradja, and, above all, Palau paintings (see MICRONESIAN CULTURES). It seems not unlikely that they, too, are somehow derived from Dông-so'n painting, even though little else in Nicobarese art or culture could possibly be of Dông-so'n origin.

d. Madagascar. The art of Madagascar (see MALAGASY REPUBLIC) is imperfectly known and has not yet been studied within a wider scope; nevertheless, a few facts which indicate its relationship to the art styles of Indonesia may be pointed out. Wooden memorial pillars, with figures of crocodiles carved in relief and surmounted by human statues, are definitely derived from the monumental style of Indonesia. In view of the megalithic character of the local cultures this is not surprising. The ornamental designs seen on shutters, beds (PL. 39), wooden plates and boxes, and other household objects are strikingly similar to those of the Saadang Toradja of Celebes and even more closely related to carvings on megalithic monuments in Sumba, with their S-shaped double spirals, plaited bands, rosettes, zigzag lines, and rows of triangles. A motif consisting of rows of squares cut by diagonal lines is as characteristic of Madagascar as of Sumba. This stylistic similarity extends also to the flat reliefs (in Sumba on stone, in Madagascar occasionally on stone but mostly in wood) that represent human figures, horsemen, bulls, crocodiles, or lizards. One may conclude that the art of Madagascar is derived from an Indonesian

UP State Museum, Lucknow

art style which must have been very similar to that of Sumba, but which must still have retained strong remnants of the monumental style at the time of the migration to Madagascar (probably in the first half or about the middle of the first millennium of the Christian Era). The human and animal figures in the designs of Madagascar warp *ikats*, woven of raffia, may be compared to those of the Iban of Borneo, of Timor, and particularly of Sumba, while some of the purely geometric patterns correspond to those of Batak and western Toradja *ikat* cloths.

Robert HEINE-GELDERN

HINDU-BUDDHIST ART. Under the influence of artistic, iconographic, and religious traditions which stemmed from India, an Indonesian Hindu-Buddhist art developed in the two large islands of Java and Sumatra, to a lesser extent in Borneo, and with a remarkable later flowering in the small island of Bali. It is possible to trace this development from the time when buildings and sculptures were first executed in durable materials, that is, from the late 6th or 7th century; contacts with India had been established, however, before that time. With the adoption of Indian civilization and religion by the Indonesian sovereigns and their courts, there arose an art which remained for a long time related to that of India but which evolved with original tendencies in each region. The Indianized civilization remained that of the privileged classes. Under these circumstances indigenous traditions quickly began to mingle with those which had been imported; asserting themselves more and more, after the 10th century and especially in the 13th and 14th, they marked the later works with a clearly Indonesian character, which persisted even after the establishment of Islam in Java at the end of the 15th century.

Relationships may often be observed between this art and those which developed in southeastern Asia under the same Indian impulse. For example, both in the Khmer culture (see KHMER ART) and in Indonesia, the direction of art was influenced by the concept of the relation of royal to divine power, and by the rite of apotheosis which derived from this idea. Many similarities are due to common origin, but more precise borrowings can be detected as well. The expansion of the Javanese kingdom of Śrīvijaya transmitted forms developed in the islands into the Malay Peninsula as far as Ligor. There, at Jaya, in the area of the kingdom of Dvaravati (whose center was in lower Menam), have been found small buildings and sculptures very close in style to those of central Java. In the Khmer style of Phnom Kulên (first half of 9th cent.) are elements borrowed from Javanese art, among them *makara* heads with their characteristic pendants, which are found turned outward on the ends of lintels as in many series of small arches in Java. The folded-over belts, and especially the body belt of the same provenance, occur in the later style of Prah Kô (last quarter of 9th cent.). Other contributions are noted in the art of Champa (see CHAM, SCHOOL OF): on monuments of the late 9th century and first half of the 10th is repeated a very beautiful foliage scroll arranged in a climbing band on the walls of Candi Kalasan and Borobudur. These examples are sufficient to reveal the importance of the two islands situated on either side of the Sunda Strait and the broad distribution of their art.

Climatic conditions in the islands of Sumatra and Java have permitted the preservation only of the monuments and objects executed in stone or metal. For this reason the appearance of the wooden palaces and dwellings can be visualized only through their representation in relief carvings, and the same is true of costume and all the objects related to daily life. What we know of the former art of Indonesia is thus of an essentially religious character. In this field there are regrettable lacunae, since, alongside the images in stone and bronze, there must have existed others in wood or painted on cloth, just as wooden annexes accompanied the great edifices. Furthermore, many of the stone monuments of the earlier periods have been entirely destroyed, and those that remain have survived only in a damaged state. Monuments abandoned when capitals and centers of culture were moved, or when religious beliefs changed, suffered many depredations. To the effects of earthquakes and the encroachments of the exuberant vegetation must often be added the vandalism of the inhabitants, who used the stones and bricks for their own buildings. Prolonged effort on the part of many scholars and archaeologists was necessary to discover, reconstruct, and interpret the architectural and sculptural vestiges of this remarkable past.

These ancient monuments attracted interest late in the 18th century, and it was early in the 19th that the clearing of the ruins of Prambanam began. Historical, archaeological, and linguistic research has continued for more than a century. It is impossible to list here all the achievements. Particularly important, however, was the work of H. Kern, who was the first to learn Kawi, the language of all the old Javanese texts, and of J. L. A. Brandes (d. 1905), who studied the Javanese monuments. Later on N. J. Krom organized the Archaeological Service of the Dutch East Indies, while the work of restoration was directed by T. van Erp. As Krom's successor in the Javanese Archaeological Service, F. D. K. Bosch has continued studies in various fields. It is impossible not to admire the method (anastylosis) by which the monuments have been restored: patiently and skillfully, often under difficult conditions, many buildings have been reerected, stone by stone. The Ecole Française d'Extrême-Orient has followed the example of the Dutch Service and used the same technique. Through this painstaking work, out of crumbled ruins and piles of stone, the Javanese temples have been reborn in all their beauty and harmony.

Historical background. The spread of Indian culture to Indonesia during the first six centuries of the Christian Era is attested by various sources: Sanskrit inscriptions going back to the second half of the 4th century have been found in Java and Borneo; archaeological remains have been discovered in different parts of the archipelago (Buddhas of the Amaravati and Gupta styles in the Celebes, Java, and Sumatra, and Buddhist and Hindu images in Borneo). The existence of relations chiefly with India, but also with China, is confirmed also by various Chinese sources, such as the reports of embassies and the accounts of pilgrims who, on their voyages to or from India to visit the holy places of Buddhism, visited the islands of the "Seas of the South"; among the latter were Fa-hsien in 414 and Yi-ching (I-ching) in the late 7th century. Hinayana Buddhism seems to have been adopted at first, but Mahayana was preached from the mid-7th century by a monk who had come from Nalanda.

The geographical situation of Sumatra and Java on the straits ensured their prosperity. The two islands, especially Sumatra, were revictualing stations and navigational landmarks on the great sea route (Spice Route), which joined India and China and touched the countries situated along the coasts. The importance of Sumatra grew with the expansion of the kingdom of Śrīvijaya, which at first was limited to the southeastern part of the island at Palembang. From the late 7th century it spread in the wake of military expeditions sent northwest to the Strait of Malacca and southeast across the Sunda Strait against Java. Its expansion in the direction of the Malay Peninsula reached, in the 8th century, as far as the region of Ligor, where discoveries have been made of sanctuaries and statues dating back to this period that show Indonesian influence.

The middle and end of the 8th century in Java was a period of great power for the Buddhist Śailendra dynasty, which was based in the center of the island. The ascension of these monarchs favored the dissemination of the "Great Vehicle" of Mahayana Buddhism (which was already mixed with Tantric beliefs) and led to the construction of important Buddhist monuments, called candi (Jav., *caṇḍi*): Mendut, Borobudur, Kalasan, Sari, and later Sewu. In the 9th century the Śailendras assumed at least nominal sovereignty over the Śrīvijayas, and the younger son of one of them even governed that kingdom about 850–60. But while the strength of the Śailendras was increasing in Sumatra during the second half of the 9th century, it was declining in the center of Java. Buddhism survived, as is proved by the building of Candi Plaosan and Candi Sajiwan at about this time, but Hinduism (q.v.) was already becoming

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

more important. The monuments on the Dieng Plateau, the northern region of the center of Java, believed to date from the late 7th or early 8th century, reveal the presence of this religion even before the appearance of the Śailendras, who were favorable to Buddhism. Their decline was accompanied by a new vitality in Hinduism, as is proved by the construction of the huge temple complex of Lara Jongrang at Prambanam in the latter half of the 9th or early 10th century. In addition a certain syncretism established itself between the two religions, later a source of new forms.

In the late 9th century and the 10th a troubled and obscure period seems to have followed the prosperous age of the Śailendras, with the kingdom of Mataram uniting the center and east of the island. The ascension to the throne of King Siṇḍok (ca. 929) saw the removal of the capital to the east, the region which became the definitive center of the Hindu-Javanese civilization.

Continuous rivalry marked relations between the two islands, which were creating strong bonds with China and India. Embassies were sent to China, and relations, at first friendly, were established with the Cholas of India, but a raid by the Cholas of Tanjore against Sumatra followed during the first quarter of the 11th century.

The vigorous literary activity during this epoch and the preceding one was continued in the kingdom of Kediri, which followed in the late 11th and 12th centuries. The great epics of India and the religious texts, which were adapted and translated into old Javanese, remained a frequent source of inspiration for reliefs, plays, and dances until the 16th century in Java and until the present time in Bali. The themes borrowed from India were thus perpetuated.

The kingdom of Sumatra was prosperous and dominated the Malay Peninsula once again in the early 13th century, but its rule diminished in the middle of the century. During the long reign of the Javanese king Kṛtanāgara, however, there was a resurgence of the power of Java. After a brief Mongol expedition carried out by Kublai Khan in 1292, the king Rāden Vijaya, a descendant of Ken Angrok, who reigned under the name of Rājasa, founded the kingdom of Majapahit.

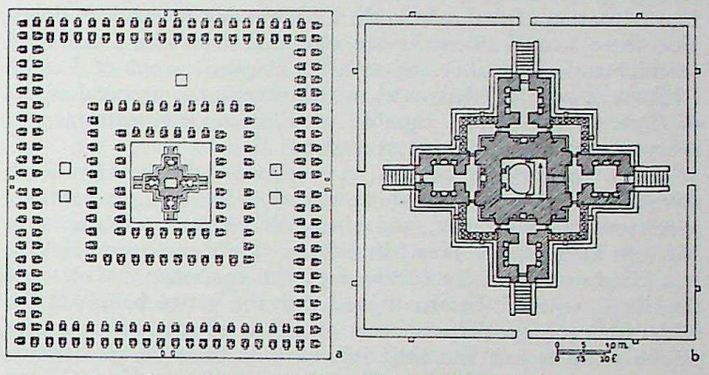
The power of Sumatra declined even further in the late 13th century, when the Tai (Thai) conquered the Malay Peninsula, and the Javanese controlled the straits as a result of an expedition in 1275. The arrival of Islam, propagated by traders about 1281, and the success of this new religion quickly led to the decline of the Indo-Malay culture in the north of the island. Buddhism, associated with Saivism, survived longer in the south of the island in the kingdom of Malayu.

Despite various rebellions, the kingdom of Majapahit prospered throughout the 14th century, reaching its high point in the period of Hayam Wuruk, who ruled under the name of Rājasanāgara (1350–89). Javanese sovereignty extended over a large part of the Malay Peninsula, and its influence was felt in Bali, where the viceroy was an uncle of Rājasanāgara. There was a great output of literature, and religious foundations were numerous. Upon the death of Rājasanāgara, however, a decline began that was accelerated in the first decades of the 15th century by rivalries and by the progress of Islam, which was aided by the growth of Malacca, a Moslem religious center and a commercial rival. The Hindu cults mixed with old native traditions survived only in the mountains (e.g., Penanggungan and Lawu), and the early 16th century saw the end of the kingdom of Majapahit (between 1513 and 1528) and the almost complete triumph of Islam. The Hindu culture — strongly mixed with Indonesian elements — persisted, however, in Bali.

The Arabs, who monopolized trade, became the allies and protectors of the small Malayan Islamic states until a new epoch began in the late 15th century. After the arrival of Vasco da Gama in 1498, the installation of the Portuguese on the Sunda Islands (taken from Malacca by Affonso de Albuquerque in 1510) was soon followed by that of the Dutch.

Religious beliefs. Since the art is essentially religious in character, it is necessary to give some information on the religions and beliefs of Indonesia. Buddhism and Hinduism (qq.v.), brought from India to the Indonesian archipelago by travelers and by the traders who settled in the islands in the first centuries of the Christian Era, often took on particular aspects as a result of contact with the indigenous beliefs. In 420 a monk from Kashmir, Guṇavarman, preached Buddhism successfully at the court. In the middle of the 7th century Dharmapāla, a monk who had studied at the great Buddhist monastery at Nalanda in Bihar, introduced advanced Mahayana teachings that were already mixed with Tantric ideas.

The conception behind the plans of the architectural ensembles was inspired by these beliefs. Thus the imposing monument of Borobudur (PLS. 30, 33, 36), which has both a cosmic and a dynastic significance, becomes a true microcosm. It was an architectural representation on a reduced scale of the cosmic



Java, Candi Sewu. (a) Plan; (*b*) plan of principal temple.

mountain which, according to Indian theories, rose in the center of the universe, and at the same time a huge, "three-dimensional mandala" (to quote P. M. Pott). The group of temples of Candi Sewu — though spread out horizontally — show a similar arrangement (FIG. 62). These Javanese monuments are related to the later mandalas of Nepal and of Tibet (qq.v.), those geometric and esoteric schemata intended to aid mystical meditation.

The development of Buddhism was favored by the Śailendra dynasty who reigned in central Java, and from there it was transmitted to Bali. In Sumatra, Buddhism became and remained the state religion from about the 7th to the 14th century, when the Sumatran kingdom of Śrīvijaya collapsed. Relations with Nalanda, source of the teachings, were still flourishing in the middle of the 9th century. Indeed, an inscription mentions that at this time a king of Sumatra was having a monastery built for his subjects who were going to stay as pilgrims in that great Buddhist center. These contacts explain how influences from the Pala and later the Sena style (see PALA-SENA SCHOOLS) reached the islands.

In spite of the predominance of Buddhism, Brahmanism or Hinduism came early and persisted under the Śailendras, as is proved by the Dieng Plateau temples and by inscriptions of 752 and 760 referring to the linga, the symbol of Śiva. The recrudescence of Hinduism in the 9th century and later is witnessed by the importance of the great temple complex of Lara Jongrang at Prambanam, with its temples dedicated to the three great divinities, Brahmā, Śiva, and Viṣṇu, and to their mounts. The Saiva sect quickly became the most important in Java, however. Śiva, who lived on a mountain, was readily integrated with popular beliefs, since the veneration of a god residing on a high mountain figured among the indigenous animist concepts that preceded the introduction of Indian culture. As in India, Śiva took on varied aspects, both benevolent and terrible. Among other deities, the sculptures reflect the favor accorded to Durgā, who is shown crushing the demon-buffalo, and to Śrī or Lakṣmī, who became associated in Java with the rice goddess. Kubera, god of wealth, shown holding a mangosteen, was popular among both Saiva and Buddhist sects.

To the religions that came from India were added beliefs (also common in part of Indochina) according to which royal power was assimilated with that of a god. The king was re-

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

garded as the earthly counterpart of a god whose name he borrowed. Thus the temple of Borobudur, with its terminal stupa, would have suggested the identification of the monarch with the Ādibuddha (the supreme Buddha), who, in addition, was assimilated there with Śiva, the "king of the mountain."

If a certain syncretism between Śiva and a native god showed itself from the very beginning, a great tolerance and often a comparable syncretism could be observed between Hinduism and Buddhism. From the middle of the 9th century Buddhist temples were to be found side by side with Saiva ones (as in the complex of Sewu beside that of Lara Jongrang at Prambanam), and the images seem to have been worshiped simultaneously by followers of both religions. The spread of Tantric beliefs was accompanied by a very complicated and often strange iconography. The favor shown to the Bhairava sect led to the representation of the gods in their frightening forms, but alongside these fearful divinities are others that possess a profound serenity and spirituality. Such is the Prajñapāramitā of Leiden (Rijksmus. voor Volkenkunde), which reveals the mystical aspect of Tantric Buddhism, capable of attaining the extremes in every direction of human thought.

Islam was first introduced in northwest Sumatra by Arab navigators. Its progress, which was slow in the 13th century, accelerated in the 15th, and the 16th century saw the first Moslem kingdom in Java. Buddhism disappeared completely, but Hinduism partially survived in the mountainous areas of the island, where it became mixed with the native beliefs in the mid-15th century. The success of Islam affected the purpose of the temples but had little influence on their design. Buildings returned to established formulas and often maintained an ancient aspect in spite of the change in their purpose. The chief effect on the art was the repression of anthropomorphic representation.

In Bali, Buddhism and Hinduism had long since been assimilated into the local culture, creating a complex of beliefs which became the official religion. Buddhism and its legends were quickly abandoned, while the survival of Hinduism was due largely to the popularity of the great Indian epics, the *Rāmāyaṇa* and the *Mahābhārata*, whose heroes became and have remained those of the theater, the dance, and the wayang shadow plays (see PUPPETS, MARIONETTES, AND DOLLS).

Evolution of the art styles. At the time when Indonesian art become historical — that is, following the 7th century of the Christian Era — the Indian art (q.v.) which provided its Hindu-Buddhist models had reached full maturity, apparent both in technical skill and in the consolidation of particular tendencies. Evolved from a long artistic history, and enriched by borrowings from western Asia and even from the Mediterranean world, the Gupta, post-Gupta, and Pala art of India revealed a superb feeling for form, tremendous inventive genius, great spiritual inspiration, and an often intensely human sensibility. By this time many of the forms created, architectural as well as iconographic, had become traditional, and principles regulating their appearance and proportions were beginning to be established. (See GUPTA, SCHOOL OF; PALA-SENA SCHOOLS.)

This whole conglomeration of traditions, symbols, forms, and esthetic tendencies passed from India into Indonesia, where the art, following its Indian antecedent, became in its turn traditional and symbolic. This vast heritage came in successive waves from different parts of India and Ceylon and left its mark in architecture, in bronze and stone sculpture, and in ornament.

The temples borrowed both their function and their appearance from India, with very little modification in the beginning. The typical Buddhist stupa — reliquary, commemorative monument, and object of veneration — was created in the form of a bell-shaped dome similar to those of Ceylon. The temples, as in India, were intended to enclose in a cell the images or symbols of Buddha and the Buddhist or Hindu gods which were the object of cult offerings or ablutions. The architectural scheme of the temple was Indian also. The main part of the edifice, which was square or rectangular, was raised on a platform and dominated by an imposing superstructure. The only vault known and utilized was corbeled; it was formed of horizontal strata, which overlap progressively toward one another on the inside, thus diminishing little by little the space to be roofed over. This method of construction results in a roof of great height, especially when the size of the building is increased. The superstructure was decorated with architectural elements, such as arches or monuments executed in reduced scale, that were repeated, following the Indian tradition, in successive stories. The technique employed limited the architectural possibilities, with the result that important temple groups were created by erecting many small buildings and juxtaposing them around the principal temple, rather than by making the latter very large or by connecting it to its annexes. Indonesian architecture remained in this phase and did not copy the later Indian developments.

Indian prototypes also imposed limits on the sculpture. As a result of the conventions governing its creation, the image acquired a symbolic character, and the form became a kind of language which only the initiated could fully understand. The type and proportions of the figures were determined by the benevolent or terrible character of the gods and of various beings. Anatomical distortions, such as gods represented with multiple heads and arms or with animal elements (e.g., Gaṇeśa's elephant head), were deliberately employed for expressive purposes. The attitudes (*āsana*), seated or standing, were established by tradition; among them are figures seated "Indian" fashion (*padmāsana* and its variants), in relaxed poses (*lalitāsana*), and in the so-called "European" seated position that became common in post-Gupta India. The symbolic gestures (*mudrā*, or *hasta*) and the attributes appropriate for each Buddhist or Hindu deity were also prescribed. The details of Indian iconography (see BUDDHISM; HINDUISM) were thus taken over, as were the lotuses that served as supports and the thrones with their decoration and symbolism.

The themes also were borrowed from India, together with the secondary figures which complete the Indian pantheon. The mounts of the great gods of Hinduism — the bull Nandi of Śiva, and the bird Garuḍa of Viṣṇu — can be found, as well as the flying creatures (genies and celestial musicians, gandharvas and apsarases) and a great number of mythical beings, such as the half-human, half-bird kinnaras, and the rakshasas, frightful demonic figures who in eastern Java seem to have been guardians (*dvārapālas*) of the sanctuaries. Indonesian sculpture adopted, besides, the techniques and many of the esthetic tendencies of Indian prototypes: the sense of volume and roundness in the deeply hollowed bas-reliefs; the preference for the stele, which led to a flattening in the poses of the figures and to development of movement across the stone rather than in depth; the suppleness of the body with its "three-bends" pose (*tribhaṅga*); and the poetic rendering of scenes, which relates the bas-reliefs of Borobudur to the frescoes of Ajanta. Finally, the similarity of dance attitudes, musical instruments, and many other details, show how deeply Indian culture affected Javanese secular as well as religious life.

Similar resemblances can be found in many of the elements of ornamentation. In richness and fantasy Javanese decoration equals that of India. The garlands, pendants, and foliage scrolls that were so popular in Gupta and post-Gupta India reappeared in Java, in addition to the vase with lotus flowers like those of Amaravati. The lion became fantastic and was shown crouching or standing erect. Two mythical creatures specifically adopted from the Indian decorative repertory were given new functions: the *kāla*, or monster's head (the Indian *kīrtimukha*) and the *makara*, an aquatic animal with a trunk, whose head alone was used in Indonesia; as in India, the two motifs were associated in the decoration of arches.

All these influences and borrowings exercised their greatest effect during the first era of Javanese and Sumatran art, which is consequently known as the Indo-Javanese period (late 7th mid-10th cent.). Later new importations modified some of these first tendencies, but the art of the archipelago has always borne the imprint of this early Indian ancestry. The Indian elements appear to have been immediately adopted, quickly assimilated, and long retained. They seem never to have pro-

UP State Museum, Lucknow

voked the profound reaction that occurred in Khmer art, which rapidly freed itself from Indian dominance and imposed a new esthetic, often contrary to that of India.

However, in Java and Sumatra, architecture and sculpture were never servile copies of Indian prototypes, and individual qualities showed themselves from the beginning. Even the earliest known temples and their sculptures are distinguished by the harmony of their proportions, by the fine balance maintained between a rich inventiveness and restraint, and by the refinement of ornament. A spirit of moderation controlled the production of the 8th and 9th centuries and separated it from the more exuberant Indian spirit. For example, where the *tribhaṅga* was used, it became less exaggerated without losing its suppleness; the Indian feminine grace was kept, but the hips and breasts have less fullness, and the silhouettes too are slimmer and more youthful. The character of the type was subtly changed. Until the 10th century facial expressions were serene and gentle, attitudes restrained, and compositions less crowded than in India. Harmony and rhythm were essentials of Indonesian art, especially in the first stage of its development; they give it the particular qualities that differentiate it from other art.

In architecture, as in ornament, borrowed Indian elements quickly acquired a new emphasis, either changing in form or finding new groupings. The string-wall of a stairway or the arches joining a monster's head with two *makara* are motifs known in Indian architecture, where they play a secondary role; in Java they become of primary importance by virtue of their proportion and richness of ornamentation. The monster's head (*kāla*) was modified by expansion of the crest of foliage which surmounts it. The *makara* was transformed even more, with its two horns curling back on its neck, a pendant falling from its raised trunk, and a little figure or lion placed in its open mouth. New combinations were created. All are imprinted with the feeling for harmony and rhythm which, together with fantasy, marks all Indonesian decoration, where real and mythical forms are in constant association.

The evolution of art in Java and Sumatra was a continuous process, without any violent breaks. Nevertheless, it can be divided, on the basis of developments in Java, into three periods corresponding to the changes in the center of civilization and to the swings of history. Each period was accompanied by a different orientation of the dominating influences. During the first period, called "Central Javanese," the majority of temples were built in the center of the island, which had become extremely prosperous under the Buddhist Śailendras. This period is also called "Indo-Javanese," since it is the time when the borrowings from India are most apparent. The period called "Eastern Javanese" corresponds to the epoch, after the middle of the 10th century, when the capitals had been moved to the east and the principal temples were constructed close to the towns of Singhasāri and Majapahit. In spite of a partial survival of Javanese art after the Moslem domination (end of 15th cent.), the island of Bali became the new center, where Javanese traditions mixed with existing local ones.

Sumatran art can be included in this scheme. It has some qualities peculiar to itself, especially in architecture, but the same tendencies and a parallel evolution often united the artistic production of the two islands.

Central Javanese Period. a. Architecture and its decoration. Many of the buildings of this period were Buddhist foundations, since the Śailendras had made Buddhism a state religion. Other temples, however, were Hindu, for this religion had survived on the Dieng Plateau and regained importance with the decline of the Śailendras. Except for Borobudur, which is in a class of its own, most buildings of this period were single sanctuaries, sometimes grouped together in an enclosure. Urns containing ashes have been recovered in the foundations of many of them, suggesting that they had a funerary purpose. The name "candi," given to all these monuments, also supports this theory; it is properly applied to a commemorative structure erected over the grave of the deceased, but it became generally applied to all the monuments.

During this period, volcanic rock (andesite or trachite) was used for all the temples; their construction reveals a highly developed technical skill. The plan of the sanctuaries is usually square, with a small entrance projecting on one side. At times this plan is transformed into a Greek cross by the addition of projecting niches to the other three sides. As in India, the edifice was constructed on a base decorated with moldings; but here the base extends sufficiently to provide a platform to which a staircase with a string-wall gives access. This platform, which permitted the ritual of circumambulation around the monuments, often has a low balustrade. The superstructure, composed of several floors, has a pyramidlike appearance derived from Indian prototypes at Mamallapuram (7th cent.); it is decorated with small arches surrounding niches and with monuments, reproduced on a small scale, placed on the platforms created by the pyramid form. In Buddhist sanctuaries these miniature structures take the form of stupas similar to those in favor in Ceylon in this period. The bell-shaped dome is mounted on a cylindrical pedestal and topped by a cubic element supporting a finial. The style evolved, however, and often the square plan is repeated in the different floors of the superstructure. Another form is also encountered; in this the first rectangular story is succeeded by another which is octagonal or circular, and which itself serves as a base for a large terminal stupa, or dagoba. This type is found at Candi Kalasan and was used in Sumatra at a later period.

The Javanese sanctuary, like the Indian temple, was designed to contain in an inner room the symbol or the image of the deity to whom it was consecrated. This principal image, placed against the wall of the cella, was often accompanied by stone or bronze statues of bodhisattvas or gods. The cella was usually small. Often there was incised decoration on the walls; sometimes there were niches or cavities for candles. Apparently there was no ceiling to separate the cella from the corbeled vault, the successive sections of which were thus visible. A trench, often very deep, contained the foundations. In some cases the cella was surrounded by a corridor which could connect not only with the entrance vestibule but also with the projecting chapels in sanctuaries where the Greek cross plan had been employed, as in Candi Sewu.

Throughout the first period the proportional height of the main part of the building and of the superstructure remained fairly low and no effect of height was attempted, as it was in the sanctuaries of Champa, for example. Even when, toward the end of the period, the temples were built taller (as in the Lara Jongrang group at Prambanam), the feeling of height was diminished by the strong horizontal emphasis. The main lines of the architecture were always emphasized by thick moldings and overhanging cornices, the latter creating a contrast between the light-catching projections and the deep shadows. In the moldings, often projecting markedly, straight lines and curves opposed each other, avoiding both monotony and slackness. The areas for sculpture and decoration were planned in advance. Sculpture was generally strictly confined, sometimes in niches or in recessed panels, sometimes framed by moldings, by undecorated bands, or by short decorative pilasters. The Pawon (PL. 34) and Mendut candis are excellent examples of the balanced distribution of motifs; the ornament is arranged in three parts on each face of the building, and rectangular panels are set in a frieze on the base between the moldings at the foot of the base and those of the cornice. In the great temple of Prambanam the decoration of the three stories of the pyramidal base combines fantasy and order by a regular succession and alternation of varied groups of figures and decorative motifs. The execution was not left to chance; the stones were cut according to the decoration they were to receive, so that the joints would not awkwardly mar a sculpture or molding. Whenever possible, the slabs used were of the shape necessary to contain an entire relief or ornamental design.

Certain elements of this architectural ornament acquired an exceptional importance in Java, as in the case of the arches that surmount or frame the doorways and niches. By the combination of the *kāla* and the *makara*, noted above, innumerable variants were created. In the most simple form, each curved

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

band that springs from a side of the head of the central monster ends in a *makara* head holding a pendant in its raised trunk. The heads of the *makara* are thus turned to the outside, but they may be faced in again by a new twist in the bands. The curves formed by the arches are usually very beautiful and are of great size when, starting from the summit of a niche or entrance way, they descend almost to its base. At Candi Kalasan they are almost monumental.

The head of the Javanese monster took on a characteristic look as a result of the breadth of the mask, the absence of a lower jaw, the largeness of the eyes, which were originally round and later spiraled, and the high growth of foliage that springs from the head and gives it a triangular shape. The stairways also became important structural and decorative elements, with the wide curve of their profile, the ornament of the side walls, and the distinctive side rail which began with the open mouth of a monster and ended in the raised head of a *makara* rendered in high relief. In an unusual fantasy, the raised trunk turns into a snake at Candi Merak. On the staircases, as on the arches, the head of the *makara* acquired distinctive characteristics, with its two horns at the base, one of them ornamented with pearls, a pearl pendant, and a motif which appears in its gaping mouth — either one or two figures, a crouching lion, or a bird. The eye, which was at first naturalistically shaped, became a spiral extended by foliage, as in the case of the *kāla*. *Makara* heads are also found on other elements — on the backs of thrones, as in India, or decorating the gargoyles or *somasūtra*s which prevent the rainwater from dripping down the walls. Among other architectural decorative forms that are typically Central Javanese are the tiny stupas forming pinnacles, and the ornaments or antefixes with triangular tops which are spaced regularly along the cornices or which form angular designs.

The architectural sculpture is of excellent quality. The male and female figures, which were often placed standing against the side walls, borrowed from India the suppleness of their pose and the details of their costumes; for example, the belts, placed one over the other, occurring in the second style of post-Gupta sculpture (7th cent.) and also in Ceylon. However, here the rich ornament mixed and modified the elements taken from India. To the garlands, pendants, and stylized foliage so popular in the post-Gupta style, Javanese art added further motifs derived from the flora and fauna of the island.

Javanese buildings were not always isolated from one another; frequently they were grouped according to their particular function, or according to the symbolic or cosmological concepts they embodied. On the Dieng Plateau, a sanctuary and its annexes were often included within the same enclosure; on this plateau and elsewhere stone platforms were sometimes used to support wooden buildings in which the priests lived, very close to the sanctuaries. Generally, though, large groupings were created by the juxtaposition of sanctuaries and temples placed symmmetrically inside one or more enclosure walls according to a methodical plan. Although these complexes are not so large in general as the Khmer units, they reveal an equal preoccupation with order and logic. The vast monument of Borobudur and the ensembles of Sewu, Plaosan, and Lara Jongrang at Prambanam, in spite of the diversity of their plans, reveal the same careful organization of structures and sculpture to fulfill the same symbolic and iconographic role. Both the Borobudur and the Sewu candis were conceived as mandalas, and the Dhyani Buddhas are placed in niches or shrines oriented in the direction sacred to each. Veritable microcosms, these temples evoke the cosmological concepts of India. The arrangement of the sanctuaries at Prambanam is related to the hierarchy established among the great gods of Hinduism and makes immediately clear the primacy given to Śiva.

b. Principal monuments. The Dieng Plateau, situated at an altitude of 6,000 ft. in the north of central Java, contains a veritable Saiva religious city, which was a center of pilgrimage for several centuries. Steles have been found there, some of which are ascribed to the beginning of the 9th century, and there is a final date of 1210 painted on a rock. Of the forty or so monuments that were built, the ruins of eight survive in the form of the stone foundations which must have supported wooden buildings according to the Hindu custom. The temples are relatively small and separated from one another, but sometimes they are found in a group. The so-called "Arjuna group" consists of four principal sanctuaries, open to the west and placed on the same axis; Candi Arjuna, the most important, is located opposite its annex, while Candi Semar, a small building intended to contain cult objects, is situated on another line. Both are enclosed by a wall.

The building of monuments continued throughout the Central Javanese period, but it seems that these on the Dieng Plateau are the oldest and simplest examples; they may date from the end of the 7th century or the first part of the 8th. Several distinct factors suggest this antiquity. The entrance vestibule forms a projection that is almost a distinct unit and hardly relates to the main part of the building, which is noticeably higher. The architectural decoration is generally exceptionally sober; the surface of the walls is often blank or, as in Candi Arjuna and Candi Bhīma, divided into panels by a simple molding. The center of each side is occupied by a narrow, shallow niche. There are two types of superstructure, the commonest being that which remained in use in central Java — pyramidal and with a marked setback at each story. The temples of the Pallava dynasty (India), such as the rathas of Mamallapuram (7th cent.; IV, PL. 254), may have served as prototypes; but on the steps of the pyramid at Dieng, in place of the miniature buildings, there are small square ornamental aediculae which have moldings and are topped by a crowning stone. The other type of superstructure is found only in Candi Bhīma. There the setback of the more numerous stories is less pronounced and the superstructure is proportionally much higher. This type too is borrowed from an Indian system which became fully developed in the shikara, but it was quickly abandoned by the Javanese. At Candi Bhīma, decoration of the roof consists of three arch systems in each story; each arch (*kūḍu*) frames a bust or head in fine high relief. The corners at the higher levels have the circular, buldous, ribbed, and flattened motif, the amalaka, which ornaments the Indian shikara. Numerous sculptures have been found near these temples; among the most beautiful are those from Candi Banon, which is now destroyed.

East and south of the Dieng Plateau are other monuments, among them the nine little groups of the temple complex of Gedong Sanga. Farther to the south, in the Kedu plain, there are other buildings, most of them Buddhist, but some, constructed at the same period, Saiva; among the latter are Candi Perot, which contains an inscription dating from 852, and Candi Pringapus.

Candis Pawon and Mendut are situated near Borobudur, to which they must be related, since they are placed on the same axis. Both are fine examples of Central Javanese architecture. Candi Mendut is the bigger of the two. The temple — 43 ft. 7 in. square — rises from a high base which has on the northwest a projection corresponding to that of the entrance vestibule; the projection is reached by a large staircase. This base is ornamented with a succession of panels which contain alternately a regular decoration forming a kind of *jeu de fond* and a balanced but freer design in which one or more real or mythical people or animals are combined with sinuous scrolls of flowers and leaves. Three panels decorate the exterior of each side of the building; the center one generally contains bodhisattvas or images of Tārā beneath a stylized tree and flying figures. In the cella there are three monolithic statues (still *in situ*) about 9 ft. high; two bodhisattvas in a position of ease, Avalokiteśvara and Mañjuśrī, frame a central figure of the preaching Buddha, seated in the "European" fashion with both legs down. These sober and imposing works are related to Indian post-Gupta sculpture, as is the ornament on the high-backed thrones.

The smaller candi, Pawon (PL. 34), is also symmetrical. On the exterior the center of each side contains a panel with a beautiful design of a stylized tree surrounded by kinnaras (half-woman, half-bird) and flying figures. On each side in a shallow niche stands a male or female figure. The principal motifs of Javanese decoration are grouped in this sanctuary,

where the *kāla* and *makara* and, in the superstructure, bell-shaped stupas are combined.

The most important works of the period are the monument of Borobudur and the great Hindu temple complex at Prambanam built a little later. Borobudur (PLS. 30, 33, 36; III, PL. 485) is a very distinctive building set on an immense pyramidal base, or *prāsāda*, and surmounted by an enormous stupa, the only one of its kind in Java. Borobudur has long been studied by scholars. For many, the esoteric nature of its symbolism (see above) is increased by the fact that the lower story of the pyramid has been deliberately masked by a new terrace placed against the front of the first. The reliefs thus concealed represented evil actions and the hells that corresponded to them, as described in the text of the *Karmavibaṅga*. According to the cosmic conception, this inferior world was situated at the edge of the mountain of iron surrounding the universe, the mountain being represented by the above-mentioned terrace. Some archaeologists believe that this double base is due mainly to a renewal of the foundations, erected so as to consolidate the ensemble; this theory would explain the alterations in the original plan that seem to have been made in the course of the work.

Recent studies by J. G. de Casparis tend to date Borobudur in the years around 825, since the writing of various short inscriptions found on the monuments corresponds to that of one dated 824. The construction and decoration of this vast edifice must have spread over several decades; a span of 35 years has been suggested, though it is not possible to calculate it precisely. An evolution is apparent in certain motifs of the ornament (in the type of *makara* and *kāla*, for example) and in the style of the reliefs. There are many elements similar to those found at candis Mendut, Pawon, and Kalasan, particularly the type of stupa and the appearance of many of the *kāla*s and *makara*s, but other elements are more like those of the later candis of Plaosan and Prambanam.

As restored in 1910 and 1911 by T. van Erp, Borobudur is composed of six layers of square terraces having 36 corners formed by redan-shaped projections, above which rise three circular platforms surrounding a central stupa 17 yd. in diameter. On the platforms are 72 little openwork stupas (III, PL. 485) placed in three ranks. The lowest terrace is about 121 yd. square, and the height of the ensemble (PL. 30) is about 114 ft. In the center of each face a stairway leads to the upper platform and to the intermediate terraces which permit circumambulation, or *pradakṣiṇā*, of the monument. The setback of the terraces leaves a space between them sufficient for a narrow gallery open to the sky, bordered on one side by a parapet and on the other by the supporting wall of the terrace above. This wall is ornamented with relief panels and niches containing Dhyani Buddhas, while the tiny stupas form pinnacles. The various Dhyani Buddhas occupy the niches on the face of the monument, each facing in the proper direction, performing the mudra appropriate to him, and seated in Indian fashion. Thus on the east face is Akṣobhya "calling the Earth as witness"; on the south face, Raṭnasaṃbhava with the mudra of giving; on the west, Amitābha in meditation; and on the north, Amoghasiddhi with a hand raised in protection (PL. 30). The statues of Vairocana, Dhyani Buddha of the zenith, represented with the preaching mudra, appear in the niches of the upper terrace and in the interiors of the open stupas on the circular platform. The number of reliefs (PLS. 33, 36) is immense; there are about 1300 panels on the supporting walls of the different terraces and on the inner face of the balustrade. The hells and the lower aspects of life were pictured on the buried story, while on the galleries above were represented the different routes to salvation — some by means of earthly life (the Jātakas and Avadānas), others by means of the celestial worlds. The representations of the Jātakas, or earlier lives of the Buddha, follow the text of the *Jātakamālā*; those of the last earthly life of the Buddha Śākyamuni illustrate the *Lalitavistara* and stop at the First Preaching of the doctrine at Benares. In its interpretation of the *Gaṇḍavyūha*, the second story depicts the travels of Sudhana in search of complete truth: he questions various bodhisattvas, then Śiva and Maitreya, to whose cult numerous panels on the galleries above are dedicated.

The total effect of Borobudur is one of considerable heaviness, for the central stupa seems too small for the immense base that bears it; perhaps the monument does not represent its originally projected culmination. Nevertheless, the excellent qualities of Javanese architecture can be seen throughout. The framing arch at the foot of the staircases (PL. 30) is among the most beautiful realizations of the *kālamakara* motif, which occurs also in profusion as a frame for the niches. The statues and reliefs are incorporated harmoniously into the ornament and into the lines of the architecture. The statues, inspired by Indian post-Gupta models, are heavy and present a puffy appearance peculiar to the Borobudur style, but the reliefs are of exceptional quality.

There are important groups of Buddhist and Hindu monuments in the plain of Prambanam situated farther to the east at what must have been the site of a large town. Many of these monuments belong to the last phase of the Central Javanese period.

According to a stele dated 778, Candi Kalasan was dedicated to Tārā. The square plan is transformed into a Greek cross by wide and deep extensions in the center of each side; three of the extensions served as chapels and the other as the principal entrance, oriented toward the west. Above the first story, an intermediate octagonal story provides a transition to the circular third floor, which originally must have been surmounted by a dagoba or stupa. The images of the cella have disappeared. According to J. L. A. Brandes, the lotus seat and footrest which have survived belonged to a Tārā in bronze; the statue must have been seated in "European" fashion and was about 19 ft. high. Candi Kalasan is most notable for the richness of its ornament, with its friezes and foliage decoration, and especially for the beautiful framing of the doorways and niches of the extensions. At each doorway an enormous *kāla* head, placed very high up and joined to the cornice of the roof, is dominated by a large bunch of stylized foliage amplified by flying and adoring companion figures. From this head descend bands ending in enormous *kāla* heads placed on each side of the door. This motif, on a smaller scale and differently arranged, recurs above the niches of the extensions, where there are more flying figures among plant ornaments. Above the figures is an architectural motif representing a kind of celestial palace of the type very popular in India at the end of the Gupta period and shortly after; this is yet another example of the connection between Javanese decoration and Indian prototypes. There are also large figures in the shallow niches which frame the doors, as well as on the roof stories.

Candi Sari has another form and a different purpose. A rectangular building of two stories, it has a roof consisting of three juxtaposed vaults, at the crest of which are aligned small stupas of the usual type; at each end of these vaulted parts a blind niche surmounts the false windows of the widest façades. By a corresponding tripartite division, each of the two stories has three adjoining rooms, which served as sanctuaries, on the ground floor, and as living rooms, on the second story. The building must have been a monastery, probably connected to Candi Kalasan. The windows and blind windows are topped by pediments and framed by standing figures, which are often extremely elegant and supple.

The complexes of candis Sewu and Plaosan, though both Buddhist, follow different schemes. Candi Sewu, or the so-called "Thousand Temples" (PL. 34; FIG. 62), which remained unfinished, is a vast ensemble of 250 separate constructions. Conceived as a mandala, it extends over a rectangular area surrounded by a wall, which is pierced in the center of each side by a passage framed by two *dvārapāla*s (temple guardians) with the terrible aspect of rakshasas. The large central temple dominates four series of small temples or shrines, placed so as to form four concentric squares on terraces of gradually decreasing height. The temples in the square nearest the center were dedicated to Vairocana, Dhyani Buddha of the zenith, while in the other squares the other Dhyani Buddhas were represented, the temples being oriented toward the cardinal point appropriate for each. The arrangement is thus similar to that at Borobudur, but here the entrances of the temples forming the third and fourth squares are placed facing each other, instead

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

of facing uniformly in the same direction on each side. The ample space between the third and fourth squares forms a courtyard in which, along the axial paths, two temples were placed; in this way monotony was avoided in spite of the regularity of the plan. The principal temple is in the form of a Greek cross, with its entrance vestibule and the chapels on the three sides opening both toward the outside and into a corridor that leads around the interior cella. Access to the cella is gained only by means of a door opposite the entrance vestibule, on each side of which there are three magnificently decorated niches with capitals in the form of *kālā* heads, pilaster bases in the form of a vase, and a beautiful motif of lotus flowers. This principal temple, similar in its arrangement to Candi Kalasan, also had in the superstructure an intermediary story supporting a large stupa. The statues in the niches and sanctuaries were numerous, and there must have been a very large statue in the cella. Outside the walled enclosure, an axial path led from each passage to an anterior temple. The remains of two of these four temples have been found at a distance of about 330 yd.: to the south, the foundation of Candi Bubrah, and to the east, Candi Asu, probably dedicated to Kubera.

Candi Lumbung, situated about a half mile to the south of Sewu, is of similar type, with a principal temple and 60 smaller temples laid out in a square.

Candi Plaosan belongs to the end of the Central Javanese period. It is composed of two rectangular edifices, which are divided into three sanctuaries. As at Sari, each must have had a floor used as a residence for monks. The two buildings of the monastery are surrounded by a rectangle of small temples and a double row of little stupas that were probably built to contain the ashes of dead monks. There are also other rectangular groups of small temples and stupas nearby.

The complex at Prambanam, Lara Jongrang, is the finest and most important Hindu monument from the end of the Central Javanese period. It seems to have been built at the same time as Plaosan, in the second half of the 9th century or the beginning of the 10th. Some of its characteristics anticipate those which appeared later, during the Eastern Javanese period. Prambanam, too, is a vast complex of large and small temples surrounded by several rectangular ramparts. Inside the first rampart the central group consists of three main temples placed side by side, dedicated to the three great gods of Hinduism. Opposite each building, somewhat to the east, are three secondary temples consecrated to the mounts of each of the gods. At each end of the intervening space stands a smaller temple. Outside the rampart of the central group and at a slightly lower level are three concentric squares formed by 156 small temples. This grouping is surrounded by another rampart, and at some distance the vestiges of a third have been discovered; this also had entrances on each of the four axes of the square.

Of the three main temples, that of Śiva, placed in the middle of the row, is clearly more important than those of Brahmā and Viṣṇu on either side. The plan of these buildings is a square with projections. The latter are particularly accentuated in the temple of Śiva, where three chapels and the entrance vestibule jut out, as at Kalasan and Sewu. The temples rise on a high pyramidal base. The terraces have a parapet-balustrade ornamented with niches and panels on the exterior and with reliefs on the inner face. A high point in architectural technique seems to have been reached in this Lara Jongrang complex, where the execution was exceptionally refined. Transformations and new tendencies that later increased began to appear here. Not only are the main temples raised on a high base, but the two smaller buildings as well. This elevation modified the appearance of the staircases, the profiles of which nevertheless remained curvilinear. The Śiva temple is divided into two false stories by a thick, flat molding, and the superstructure is proportionally higher than in temples of the type represented by candis Mendut and Pawon — tendencies which later developed further. The setback is still clearly marked, and the platforms thus created are filled with a series of aediculae, the shape of which seems to have been inspired by the modified stupas to be seen in Candi Sewu in similar positions; they consist of a bulbous, ribbed element on a tall, square base, topped by circular moldings and a cylindrical finial recalling a linga. The same motif is used for the crowning stone of the temple.

The sculpture and ornament are as fine as the architecture. The temples and niches contained numerous statues corresponding to the many forms in the Hindu pantheon. In the central cella of the temple consecrated to Śiva Mahādeva, there is a large statue of the god on a pedestal with a waterspout for ablutions. The bull Nandi — from the sanctuary dedicated to him — is also an outstanding and beautifully balanced work. The decoration on the bases of the main temples is very symmetrically arranged. On the lowest level there is a series of panels divided into three parts; a central niche with a crouching lion is flanked on each side by a stylized tree between two mythical or real animals. Elsewhere, statues of divinities and groups of figures alternate, the former shown motionless, the latter in animated postures. In this decoration the tendencies of the two successive Javanese periods may be seen juxtaposed: supple and elegant figures with serene, gentle faces, similar to those at Borobudur, were represented side by side with figures of a quite different type, characterized by expressions and movements that are sometimes almost violent — precursors of a style which was to be seen later.

c. Sculpture. Javanese sculpture was abundant at all times but particularly so in the Central Javanese period, when figures were blended into the total architectural scheme. The sculpture, whether in stone or bronze, was usually of excellent quality, revealing a high level of technical skill. Like the architecture, it clearly shows the influence of Indian prototypes. The discovery in Java, Celebes, Borneo, and Sumatra of bronze and some stone images connected to the Amaravati and Gupta styles proves the penetration of these influences before the flourishing of art in central Java. These works were either imported from India or copied as closely as possible. Among the stone sculptures reproducing Indian models are two works found in Sumatra: a large Buddha, 11 ft. 9 in. high, found to the west of Palembang, which must have been carved at Bangka (5th or 6th cent.) in the Amaravati style; and a standing life-size Buddha, found at Jambi, still rather crude but showing Gupta characteristics. There were successive waves of Indian influences, but it is often difficult to determine exactly the origin of tendencies appearing in Indonesian art, as a certain parallelism existed in different sites in India in the same epoch. The influence of the Pala style, and later the Sena, seems to have been particularly strong. A refinement, even a certain preciousness, a spirituality that idealized the forms, a moderation and sweetness tending to become conventionalized — these are characteristics which are found in common in the art of Bengal and of Java. Many details were transmitted from one to the other, such as the random undulations of the Brahman ribbon and the long necklaces which hang across the chest, the roundish modeling, the curved lines of the silhouette, and the bulging appearance of the body. The parallels are numerous in the bronzes too: the casting technique; the types of nimbus and throne, with a similar treatment of the symbolic animals that decorate them; and even, in many cases, the repetition of the same motifs, such as the lion mounted on an elephant. After the establishment of the Buddhist university of Nalanda in Bengal and Nepal, which remained centers for the development of Tantric Buddhism, Ceylon held a great attraction for Buddhists and was an object of pilgrimage, and consequently the influence of its art was felt in Indonesia. Equally noticeable is the spread of Gupta and post-Gupta styles as a result of the transmission of forms developed both in Buddhist sites (Ajanta, Ellora, and others) and in Hindu localities of the Chalukya and Pallava dynasties (Mammallapuram, 7th cent.). The combination of a monster's head with the *makara* had been made at Ajanta before it occurred in Java. Some of the costume details (e.g., jewelry decoration, the metalwork belts, and the curving bands of tucked-up cloth) depicted in Java and Sumatra came from India. These borrowings from Indian civilization were both varied and important; they are revealed not only in the iconography and the costume but even in the furniture and musical instruments depicted in the reliefs.

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

As already noted, however, Indonesian art quickly asserted individual qualities. Throughout the first period these qualities are those which emanated from architecture: harmonious proportions, elegant form, balance between structure and the decoration — in short, the spirit of restraint characteristic of Javanese art (which, however, tended to diminish toward the end of the period, especially in the reliefs of Prambanam).

In addition to its religious purpose, sculpture in the Central Javanese period played a dominant part in the decoration of monuments, and the numerous large statues are integrated perfectly into the architecture. The works are grouped according to various types, but the same tendencies recur. The objects in stone (chiefly volcanic granite) include cult images and niche statues in the cellae, chapels, and small temples; isolated figures and groups in the round used for decoration and for religious purposes on the outside walls; scenes depicted in relief on balustrades and supporting walls (at Borobudur and Prambanam); and various celestial and ascetic beings that often appear in the ornament (gandharvas, apsarases, rishis). Among the bronzes there are large cult images (such as the Tārā of Kalasan); of the many medium-sized and small statuettes in bronze, only cult objects have survived, all executed with great care. The bronzes were cast by the lost-wax process and show a high level of technical skill. Their greenish patina is exceptionally beautiful, and the refinement of details is often exquisite.

Among the large stone statues executed in the round, those in the niches at Borobudur and the three cult images from Candi Mendut belong to the Indian post-Gupta tradition. The heaviness of the form, with its rather overblown quality, connects the Dhyani Buddhas of Borobudur with those added at about the same period to the façade of Cave XIX at Ajanta (q.v.). The imposing size of the sculpture at Mendut brings to mind the Buddhist statues of Ellora (7th cent.), but there is a restraint in treatment and a balance in proportions in the Javanese works which makes them much finer. The feeling for volume found in Indian sculpture reappears in Java, together with the predilection for creating images in the stele form, a preference which led to a flattening of the figures and their poses. Many works from the Dieng Plateau are among the most beautiful of this period — for instance, the heads from Candi Bhīma, whose restrained expressiveness gives them the quality of portraits, and the images of the great Hindu gods from Candi Banon, among them Brahmā, Śiva, and Viṣṇu, shown standing with their mounts in the background. Refinement and elegance are the dominant qualities of these works, which are notable for the serenity of the faces, the naturalness of the attitudes (frontal but without stiffness), the simplicity of the supple modeling (rounded but without heaviness), and the richness of adornment. The last is abundant; there are diadems, necklaces, armbands and bracelets, and various kinds of belts with beautiful clasps. This finery adds a note of superfluity to the effect, but since the ornamentation is incised, it does not encumber the figure or spoil the main lines of the silhouette. The same delicacy is evident in such costume details as knots with the ends falling symmetrically from the belts, and a narrow scarf that hangs across the body. These characteristics of the Candi Banon statues also occur in other works of the period.

A similar idealization of form and softness of modeling, and the same slightly pensive, kindly smiling faces are to be found in the reliefs and in the decorative wall sculptures — such as those at Candi Sari — which were often posed in the subtle *tribhaṅga* attitude. But on the bases at Prambanam, alongside groups of figures of this type where the elegance is perhaps overly conventionalized, there are also others of a different type, in less graceful but more natural attitudes, more lively, with less poetic but more intense expressions. These two types apparently coexisted in this way from the end of the 9th century, both persistently reappearing in the art of eastern Java.

Other works of the Central Javanese period must also be noted, some that were found in Borneo and many fine examples discovered in Sumatra. The sculpture of Sumatra resembles the art of both Pala and central Java; the stone and bronze images display similar characteristics, with similar details of costume and ornament. The attire, despite its simplicity, still retains its importance and purity of form. These characteristics are displayed in a life-size Lokeśvara that is exceptionally restrained, from Bimgin (Djakarta Mus.), as well as in a group of much smaller bronze images, found near Palembang, representing Śākyamuni, Maitreya, and Avalokitésvara. The bulging chests of the two bodhisattvas connect these statues with the Pala style. Other works seem to have undergone Pallava influence.

The reliefs of Borobudur and Prambanam show the typical tendencies of the Central Javanese style and, at the same time, the evolution that was beginning to occur toward the end of the period. At Borobudur (PLS. 33, 36) they are arranged in a long succession of panels on the balustrades and supporting walls of the different terraces. In the first gallery, two rows arranged one above the other fill the entire wall; devoted to the last earthly life of the Buddha, to his earlier lives (Jātakas), and to pious legends (Avadānas), they constitute the finest group. At Borobudur, as in India, the relief is quite deep and reveals the same feeling for rounded forms. The designs are clear and often skillfully composed, with subtly balanced groups of figures, architectural elements that are always seen from the front, and trees with perfectly vertical trunks to set off the scenes. Trees and architecture are diminished proportionally according to the space available. The protagonists of a scene stand out, not by means of an increase in size but by being isolated, often raised on a platform or a throne, or sometimes framed by a canopied dais or an architectural element. Frequently a small pavilion was chosen for interior scenes. Other figures were grouped in immobilized poses; the secondary figures, pressed against one another, in many cases functioned only as a filler. The compositions are not overloaded, and there are even some empty spaces preserved. An impression of soothing calm and softness emanates from the reliefs because of the grace of the figures and the elasticity of their movements, which are never extreme. A poetic atmosphere of an idealized life is created by the languorous grace of the poses, by the serene, smiling, sometimes pensive expression of the faces, by the abundance of scenes of court life, and by the beauty of the setting for the various episodes. An idyllic charm pervades the landscapes, where animals are commingled with foliage: a ewe and its lamb romp on the grass, small animals climb along the conventionalized rocks or swim among lotuses, and birds fly among trees or perch on them. The love of nature that shows itself here remained a characteristic of the relief sculpture, in which landscape was to become more and more important. Although life was embellished and transformed, reality also found a place in the art of Borobudur, which was often human and sensitive. Many of the gestures and postures are natural, apparently having been closely observed in nature; the poses and facial expressions reveal acute sensibility. Also represented with precision are the details of everyday life, such as high-roofed houses of a particular local type and boats with sailors busy in the rigging.

The reliefs of the upper stories at Borobudur, devoted to the search for truth by Sudhana and to the cult of Maitreya, are rather different in style. The compositions are more crowded and the groups not so connected. Perhaps because of the variety of subject matter, architectural elements sometimes abound at the expense of the human figure, or again some scenes depict daily life more faithfully and the poses become more exaggerated. Perhaps some of these reliefs were executed later and mark the beginning of a change in style.

This evolution is seen clearly in the reliefs of Prambanam, where the more dramatic episodes of the legends of Kṛṣṇa and Rāma are depicted. Some of these reliefs are similar to those of Borobudur, while others are completely different. In the panels spread along the inner face of the balustrades many scenes are grouped, often following one another without divisions. The compositions, which are fuller and sometimes overcrowded, are generally less clearly arranged. The scenes give an impression of strength, roughness, and violent energy. Although some of the persons, such as the hero Rāma and his

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

brother, retain the idealized appearance seen at Borobudur, the type is cruder — the bodies are more contorted and their movements more stressed. Many of the faces have a distinct hardness, are of a different physical type, and often have aggressive and frightening expressions. The calm compositions of Borobudur, where horizontals and verticals predominate, were succeeded here by tumultuous groupings in which the figures are intermingled with animals and landscape, and the settings increase in importance; if there are masses of flowering trees, their trunks and roots are twisted and interlaced. Some of the figures take on a fantastic and even cruel appearance; such are the rakshasas, demonic giants fought by Rāma, and even sometimes the monkeys, his allies. The earlier grace is still found in some female figures, side by side with an aggressiveness that may be suggested even by the landscape itself or by grimacing sea monsters (as in the episode of the ocean stopping the monkeys before the island of Lanka). A realistic note distinguishes familiar scenes, which become more numerous, and the representations of everyday objects and local types of houses begin to multiply. A more popular and indigenous character thus seems to emerge in many of the episodes, where the protagonists, as a rule, no longer wear the rich diadems and ornaments of the court scenes of Borobudur. The same evolution is found later in the reliefs of Djalatunda.

Eastern Javanese period. After the center of the island was abandoned, for reasons that are still uncertain, eastern Java became the center of culture under the kingdoms which followed successively from the accession of Siṇḍok (ca. 929) until the arrival of Islam. Building seems to have been less active at first but intensified in the 13th and 14th centuries, especially in the period when the capital was first at Singhasāri and then at Majapahit; a decline seems to have set in at the beginning of the 15th century. During this period the dating of monuments is much more precise, for usually the name of the dead king to whom they were consecrated is known.

a. Architecture and its decoration. Differences between the monuments of this and the preceding period are clearly apparent, even though a continuity can be detected. There was a change in the purpose of the monuments which corresponded to a change in beliefs: the majority of the temples now built were Hindu and only a few Buddhist, and even in those few Buddhism was mixed with Saivism (as at Candi Jawi, dedicated to the cult of Śiva-Buddha). The funerary character is of even more importance in the monuments and sculpture than in those of the first period; not only the temples serve as mausoleums but also the bathing places, which sometimes have an architectural decoration and are embellished with sculptures, as at Djalatunda, Belahan, and Candi Tikus. The use of brick, which was almost standard in eastern Java, modified the appearance of the buildings. A transformation is also evident in the form of the sanctuaries and their component parts, in the concept of the total ensemble, and in the changes brought about in the ornament.

In spite of such differences, the derivation from the monuments of the Central Javanese period can always be discerned. The plan of the sanctuaries is in general the same; the square plan with an entrance on only one side predominates, though there are often false gates on the other sides. Sometimes the square plan was transformed into a modified Greek cross, as in Candi Singhasāri. The three distinct parts of the building were retained, but the effect of height was increased by proportionally raising the various components: the base, which projects very little, the temple itself, which is divided halfway up by a flat band varying in width and thickness, and especially the superstructure, the silhouette of which is transformed. The change of proportions was accomplished, however, without any loss of harmony.

The setback of the successive stories, which were more numerous, was less accentuated; often only superimposed moldings of flat bands were used, ornamented with acroteria at the center and at the corners. The crowning stone takes the form of a cube, and a similar member is found at the apex of the niches, as in Candi Kidal. The silhouette of the stairways, high and projecting slightly, is completely changed. The broad curve of the thick balustrade, typical in central Java, gives way to a flat vertical band, scarcely rounded at the top and ending at the bottom in a flattened spiral. There, as elsewhere, the *makara* in very deep relief, so popular in the Central Javanese style, was abandoned, although gargoyles may appear. The customary arcade joining the *kāla* and the *makara*, which had known so many variants, was no longer used. Framed by a flat band, the narrow niches and doors became quite rectangular and were surmounted by a flat horizontal projecting slab which forms a lintel. The doorways are thus separated from the immense *kāla* head which continues to surmount them and which is attached to the cornice supporting the superstructure. Quite exceptionally, the temple of Nāga at Panataran retained a decoration in high relief, with large figures supporting the undulating bodies of serpents, but elsewhere the numerous figures which played both a decorative and a religious role in central Java did not reappear. Often long rows of reliefs of a uniform depth were set in the high bases (e.g., Candi Jago). In general the ornament remained abundant on the frames of doorways and niches and on the various bands. Though the erect lions of Candi Kidal were the successors of those of Candi Ngawen, and derived from India, more and more the motifs borrowed from Indian art gave way to different ones. In the medallions, for example, fantasy still mixed with a certain naturalism characterizes animals and various beings treated in flat relief, but their bodies are transformed by the use of curved strips and hooked spirals (Candi Panataran, Candi Kidal, and others).

The high bases of several stories supporting a building were still used (as in the central sanctuary of Panataran), but often they had variations, such as the lengthening of the square plan so that it became rectangular. At Panataran (PL. 35) the various monuments are arranged on terraces placed successively one behind the other; a certain symmetry is retained in the disposition, but it is only approximate. The great centralized groups in regular ranks, usual in central Java, were employed no more. Instead there were modified or new forms, such as the double stairways placed either parallel to the façade or on each side. The doorways followed the evolution of the temple architecture, which they reproduced in a simplified form. Two types can be distinguished: in one the opening of the entrance is covered by a roof; in the second the superstructure is interrupted above the entrance, so that the doorway is "cut out" and appears as a narrow passage between the two halves of the temple. The bathing places took on importance (Candi Tikus) and were connected to the temple groups (Panataran).

b. Principal monuments. Few buildings seem to have been built before the 13th century, or at least very few have survived. Among the remaining examples are the foundations of Gunung Gangsir, of Djalatunda, and of Belahan. Several monuments in Bali also go back to this time.

Candi Gunung Gangsir dates from about the middle of the 10th century. Built in brick, it continues the Central Javanese style, but an Eastern Javanese character is introduced in the height of its base, which projects very little and consequently did not permit circumambulation.

The royal bathing place of Djalatunda appears to have been the sepulcher of King Udayana, father of Erlaṅga (Airlangga). An inscription bears a date corresponding to A.D. 977. On one side of the rectangular bathing place is enclosed a terrace on a higher level. In the center of this, water channeled down from the mountain falls on the sides of a linga (the symbol of Śiva) and is then fed into the lower basin by gargoyles. The reliefs decorating the edges of the terrace refer to the legend of the five Pāṇḍava princes, and in particular the story of the last, Udayana. The style of the reliefs is unusual. (According to Bosch, they were influenced by works in terra cotta.) Certain details connect them to the reliefs at Prambanam, but they show a further stylistic evolution. The landscape becomes pervasive; flowers and foliage, only slightly stylized, display a fine naturalism, whereas other elements such as the rocks and clouds are quite conventionalized. This domination by nature seems

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

to correspond to a revival of the animist beliefs of the old Indonesian culture.

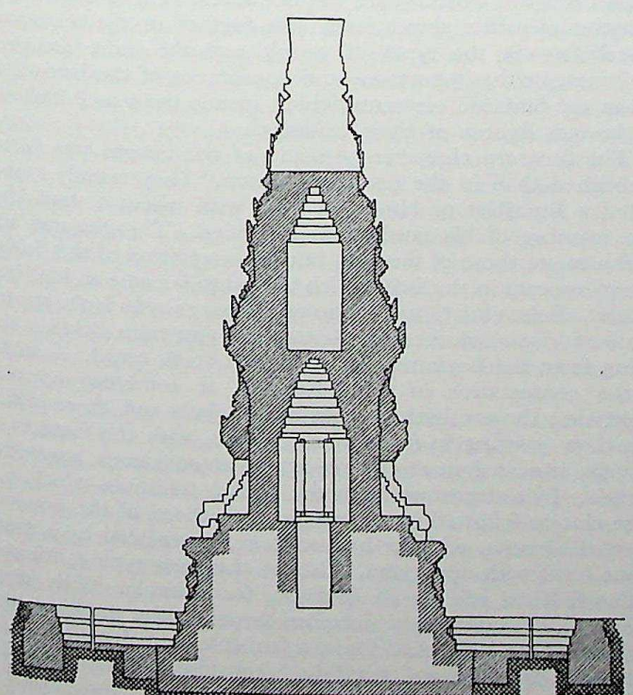
Another royal bathing place, that of Belahan, is the mausoleum of King Erlaṅga, which must go back to the middle of the 11th century. In the niches there still exist beautiful statues of Lakṣmī and Śrī, who pour the water into the basin. Also belonging to this complex is an excellent portrait statue of King Erlaṅga in the form of Viṣṇu mounted on the bird Garuḍa, a work which combines the styles of central and eastern Java.

The complex of Tampaksiring in Bali belongs to the 11th century. The funerary site consecrated to the youngest brother of Erlaṅga and his family, it consists of a cloister and a dozen candis sculptured in high relief in the rock to look like the constructed temples.

Building became more frequent during the 13th and 14th centuries, when the capitals were successively Singhasāri (after the death of Ken Angrok in 1227) and Majapahit (14th cent.).

Candi Kidal is presumed to be the funerary temple of King Anūshapati, who was the son of Ken Angrok and who died in 1248 (FIG. 77). While deriving from the past, this monument shows clearly in its tall proportions and in its ornament the tendencies of the Eastern Javanese style. New and old features are juxtaposed; medallions decorated with an engraved motif (as at Panataran) can be seen on the main part of the edifice, and supporting lions are found at the corners of the base, as at Candi Ngawen of the first period. The superstructure, which is particularly high, encloses a square chamber located above the interior cella but completely closed and inaccessible. This second room, probably intended only to lighten the superstructure, is sometimes found in buildings of great height and size.

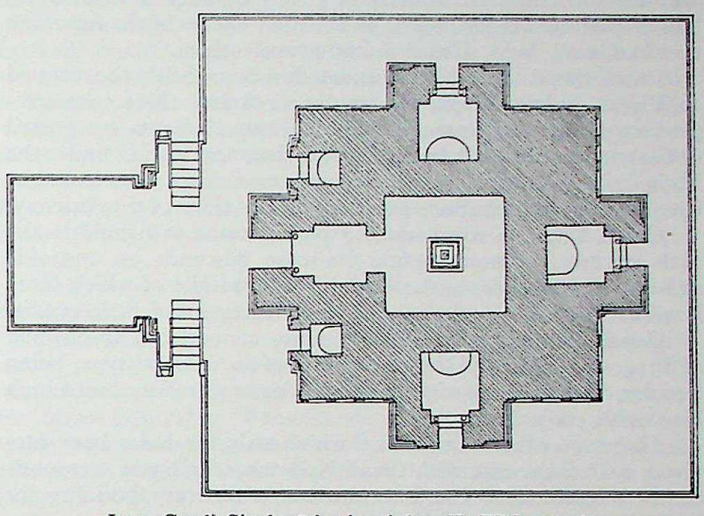
Candi Jago is a Buddhist monument consecrated by King Kṛtanāgara to his predecessor Viṣṇuvardhana, who died in 1268. The arrangement of the terraces supporting the temple is exceptional: the square base of the sanctuary is placed on two high rectangular platforms, which are very much extended in front; access is provided by two lateral stairways. The Indo-



Java, Candi Kidal, section (*after W. F. Stutterheim, 1927*).

nesian character of the ornament and of the long rows of reliefs is marked. The figures, which are in very shallow relief, are depicted in silhouette. An image of King Kṛtanāgara appears in the cella. The principal image was an Amoghapāśa with eight arms, placed among representations of various Tantric Buddhist divinities.

Candi Singhasāri was associated with the posthumous cult of King Kṛtanāgara, who died in 1292. This temple had a more complex plan (FIG. 78). It rests on a particularly high base and is surrounded by four smaller sanctuaries, each placed at the middle of one side of the base. The principal cella occupies the center of the base and is thus on the same level as the cellae



Java, Candi Singhasāri, plan (*after K. With, 1920*).

of the four secondary sanctuaries. In this unusual arrangement, with the cella in the base, the temple itself contains only an upper room that is inaccessible. The numerous sculptures of this Saiva monument are of fine quality and show clearly the persistence of influences of the Central Javanese style.

The complex of Panataran (PL. 35) is the most important of the eastern part of the island. Its construction was probably spread over several centuries, since the inscriptions bear dates ranging from 1197 to the 14th century, but most of the buildings must belong to the end of the 13th century and to the 14th. The complex, which is enclosed by an irregular wall, is composed of three parts lying one behind the other. In addition to stone bases, some richly decorated, there have survived the small "dated temple" (an example of the typical architecture of the period), the lower part of the beautiful temple of Nāga, and, at the very back, the high, multistoried pyramidal base of the principal temple. This was built a little later, in the 14th century, and the body and superstructure of the temple have disappeared. The plan of the base is a square with projections and a central extension on the lowest story of each side. This extension is more pronounced on the façade, where it is flanked by two stairways.

The abundant decoration of the monuments at Panataran is very characteristic of the tendencies of the period. The terrible beings with demonic aspect and the rakshasas in the round, which are placed, crouching or upright, on the sides of the stairways and the entrances, have become the customary guardians of the sanctuaries. The base of the main temple exhibits varied elements and motifs. On the outer face of the lower story, ornamented medallions alternate with rectangular panels containing reliefs with figures. A long row of bas-relief scenes stretches along the second story, above which are spaced fine ornamental motifs sculptured in high relief; a lion support alternates with the forepart of a serpent with head raised, and both creatures are framed with wings in shallower relief — a motif which was to increase in popularity.

In the bas-reliefs, flattened figures in angular attitudes are treated with uniform modeling. There, as elsewhere, their Indonesian aspect and the violence of the rakshasas contrasts with the idealized images of the sanctuaries, where for the most part Central Javanese traditions survive in spite of modifications. The medallions of the lowest story of the base are incised, as are some rectangular panels which illustrate episodes of the *Rāmāyaṇa*; the people or animals, the fantastic elements of the decoration or landscape, which are very stylized and

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

unreal, are shallowly cut on a flat ground and are silhouetted like the marionettes, or wayang, of the shadow theater. The exuberance of the ornament and the sometimes exaggerated attitudes of the entangled figures are happily counterbalanced by the cleanness of the moldings and cornices and by the sobriety of the undecorated parts. The main lines of the architecture and the decoration are thus kept clearly distinct and balanced. These qualities are also found in the monuments of the following epoch: Candi Jago, Candi Jabung, and others.

Candi Sawentar, which is undated, was probably consecrated to Viṣṇu, judging from the sculpture found there. Its proportions and the appearance of the various elements are typical of the sanctuaries built in the Eastern Javanese period under the Majapahit dynasty. The winged ornamentation, which was to become more popular, appears here on the sides of the stairway.

Candi Tikus, a royal bathing place, seems to belong to the 14th century. A monumental staircase descends on one side into the large quadrangular basin, in the middle of which there is a vast platform supporting a whole complex of little candis.

Candi Jabung, a Buddhist temple, contains an inscription of 1354. The body of the building is of an unusual type, being circular, with one real and three false doors; it is placed on a high base with projections.

There are other temples of which only the bases have survived; such is the case with Candi Keḍaton, which was surrounded by terraces, and Candi Surawana, a funerary building for King Wengker, who died in 1388.

In Sumatra, while some monuments existed before the Eastern Javanese period (a fact proved by the sculptures and remains of ornament which correspond to the Central Javanese style), the existing ruins go back only to a period from the end of the 11th century to about the 14th. The ruins are sufficiently important to reveal the character of Sumatran architecture, in which brick was used almost exclusively. The forms developed in central Java continued — the bell-shaped stupa; the wall marking off the sacred area; the sanctuaries with a square plan and a doorway, sometimes set forward, on one of the sides; the pyramidal roof supporting a crowning stupa; the little stupas on the stepped terraces; and the stairway with balustrade ending in a *makara* head. Many of the Sumatran buildings were built before the great period of construction in eastern Java, but they are related to the Eastern Javanese style by certain details: in particular, the use of rectilinear moldings with angular cross sections for bases and cornices, and the presence of rakshasas with similar aspect beside the stairways. Some local forms were developed in the island from time to time, and the decoration of the monuments seems to have remained more sober than in Java.

The first mention of the site at Jambi goes back to 664, but the remains of buildings that have been found are scarcely older than the 11th or 12th century; their number shows that these temples must have been part of a large city. At Sungei Langsat, a base in the form of a Greek cross indicates that the evolution of architectural forms was similar in the two islands. An older base, in which moldings with a curved cross section alternated with angular moldings, had been overlaid by later masonry in which only angular cross sections were used.

Parallels with Javanese architecture can also be seen in the complexes of Muara Takus, farther west, and of Padang Lawas, in the northwest of the island. At Muara Takus ruins dating from the 11th and 12th centuries, according to F. M. Schnitger, are grouped in the same enclosure. The most important monument was a stupa, of which the circular molded foundation alone remains. This stupa stood on a base which itself was supported by a double extended terrace. Other buildings of the same group have notable features. The Maligai stupa is especially unusual. Probably the tomb of a Sumatran king, it looks like a very high tower of red brick raised on a projecting base. The badly damaged upper part was a bell-shaped dagoba having four crouching lions at the base. The neighboring terrace of Candi Bungsu supported a large stupa surrounded by smaller stupas, a grouping which recalls the upper terrace of Borobudur on a reduced scale. At the end of the same platform stands the base of another stupa, in which was found, together with gold leaf and some cinders, a gold plaque with an inscription that F. D. K. Bosch has dated in the 12th century.

The region of Padang Lawas contains 16 sites, the majority of them Buddhist, as is usual in Sumatra, though a few were Saiva. The most important group, Si Pamutung, had four sanctuaries in the same enclosure; the principal one is the largest on the island. The construction of the monuments at Padang Lawas extended from the 11th century to the 13th or 14th. The reliefs on the base of Candi Pulo are in a style clearly later than that of the sculpture of the other sanctuaries. In the various ensembles the buildings, usually sanctuaries with square cellae, are raised on one or two terraces ornamented with panels. These terraces are not very high but are sufficiently wide to permit circumambulation. The superstructures, which consisted of several stories, were square, octagonal, or even circular. Small stupas were placed on each level, and a tall one crowned the building. Large *makara* heads, accompanied by rakshasas and sometimes by lions, terminated the projecting stairways. These buildings seem to have been more sober and more austere in effect than the Javanese buildings; the proportions are very subtle and give an impression of imposing size, although the dimensions are actually quite modest.

c. Sculpture. During the Eastern Javanese period sculpture was still abundant; cult images were numerous in the cellae and chapels, and relief panels were the usual ornament of the stepped bases. However, large decorative figures no longer appeared on the main structures. Despite an evolution, the traditions of the Central Javanese style persisted in the images of Buddhist and Hindu gods placed in the interiors of the sanctuaries. There was also a partial renewal of Indian influence; contacts with the continent remained lively, and new influences spread to the islands. At the same time a recrudescence of indigenous beliefs can be detected, manifested especially in the Indonesian appearance of secular figures and of the female figures ornamenting the bathing places (the figures in the museum of Mojokerto, for example) and in the violence and fantasy of the rakshasas which guard the entrances. This reappearance of native elements shows itself still further in the numerous bas-reliefs — in the types of people and the more awkward groupings, in the importance and appearance of the landscape, and in the fantastic elements which invade the panels and rob the human figures of their primacy.

The funerary character of many of the images was better established than in the preceding epoch. They usually represented a Buddhist or Hindu divinity with whom a dead king or a member of his family was identified. The gestures and attributes are those of the god, but the suggestion of the deified human appears in the face, which tended to become an idealized portrait. Belonging to this group of funerary works is the superb statue of Viṣṇu mounted on Garuḍa, coming from Belahan and dating from the beginning of the period (11th cent.). A statue of the consecration of King Erlaṅga, it combines opposed tendencies: those inherited from central Java and those which were now growing in importance. Viṣṇu, with the features of Erlaṅga, is seated in serene majesty on an enormous, aggressive Garuḍa. In a departure from the Indian tradition, which was more closely followed in central Java, the head of the previous types of Garuḍa, with its hooked beak, is replaced by a monstrous head with open jaws. Use of this new type continued, at Candi Kidal and Candi Keḍaton, for example. With wings outspread, trampling and grasping serpents, the mythical bird has become an unleashed force, a fantastic animal which anticipates the fabulous and terrifying monsters still kept alive by the Balinese theater.

This presentation is fairly rare, however. In the Singhasāri and Majapahit styles, the figure of a deified king is set back against a high stele. The king-god, often with multiple arms, stands in a strictly frontal attitude and holds the appropriate attributes. Sometimes the face is cold and inexpressive; in the poorer pieces the posture is often rather stiff and awkward, and the proportions become heavy. Although the Central Javanese traditions can still be discerned, the elegance and unity of the form often have disappeared. The diadem, treated in

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

very high relief, weighs down the head; the jewels and the details of the costume — too numerous and too prominent — break up the surface unity. Many of these sculptures, nevertheless, are of excellent quality; among them are the more supple Buddhist figures of Candi Jago, which display in their faces and gestures of adoration a softness and spirituality (the stele of Sudhana, for example). Another fine work is a replica of the main image of Candi Jago, an eight-armed Amoghapāśa surrounded by Tantric divinities, which was sent to Sumatra in 1286 and consecrated anew by the Sumatran king Ādityavarman in 1347. The seated Prajñāpāramitā of Candi Singhasāri is very pure in form and of a rather frozen elegance, but in its perfect meditative serenity it reflects the mystical aspects of the beliefs. According to tradition the features are those of the wife of the first king of Singhasāri (first quarter of 13th cent.). On the tall steles the large standing image is framed in designs. In the Singhasāri style (13th cent.), the leaves and flowers of a lotus stem climb up each side to the top of the stele; this stem seems to spring from a bulb or from a vase, which is sometimes masked by two small figures. In the Majapahit style the background is simpler: short parallel superposed lines form a serrated halo that surrounds the image, the stiffness of which is often even greater than in the Singhasāri style.

In the sculpture of the cellae and chapels the many aspects of the Indian pantheon reappear: Hindu forms (especially Saiva), and the forms of Tantric Buddhism, which is here very much mixed with Saivism. In accordance with the beliefs of the sovereign who consecrated them, the steles and bronzes depict Śiva, Pārvatī, or Durgā as often as Viṣṇu and Śrī, or Harihara, who combines Śiva and Viṣṇu. Also represented are the Dhyani Buddhas, the bodhisattvas, and Tārā. Among many others, the works from Candi Singhasāri deserve to be mentioned. They are of fine quality and reveal the varied forms and tendencies in religious sculpture of the period. The Prajñāpāramitā in the Leiden Rijksmuseum voor Volkenkunde comes from this monument. Quite different is a Bhairava (the terrible aspect of Śiva), which is a portrait statue of King Kṛtanāgara, who encouraged this form of Saivism. This statue — also in the Leiden Museum — represents a four-armed Śiva dancing on a pedestal surrounded by heads of the dead. His face is demonic, with bulging round eyes and two fangs emerging from his half-open mouth. Śiva's macabre and bloody trappings influenced the representations of Tantric Buddhism, which borrowed many forms from Saivism in Sumatra as well as in Tibet. Skulls form Śiva's diadem and ear pendants, severed heads are threaded on a long necklace, and the god holds a cup shaped like a monster's head and a knife in the form of a *vajra* (thunderbolt). But this violence is tempered by the balance of the whole piece and the lack of vigor in the movement. The two feet placed on the ground retain the attitude which was used for the cosmic dance of Śiva in India prior to the mid-7th century, when it was abandoned for another that was more dynamic.

The spirit of moderation inherited from the Central Javanese style also permeates other statues: in the theme of Durgā whose *élan* is subdued (also from Singhasāri); in the Gaṇeśa of Bara, where preciousness is mixed with the macabre; and in the two-armed Bhairava of Sungei Langsat (14th cent.). In this last piece, which comes from central Sumatra, an immobility of pose and a roundness of form diminishes the effect sought in the portrayal, which is probably that of the Sumatran king Ādityavarman, who was initiated into the Bhairava sect in his youth during a stay at the court of Majapahit. In the terrible aspect of the Bodhisattva Mañjuśrī, with a small statue of Dhyani Buddha Akṣobhya in his high coiffure, the deified king is standing on a pedestal surrounded by skulls, and under his feet he crushes a human being. He is richly adorned: among the strings of pearls in his belt a monster's head thrusts forward, and his dress is bestrewn with skulls and crescent moons; serpents serve as ear pendants and encircle his arms and ankles.

A more dynamic sculpture is a dancing Heruka from Bahal II (Padang Lawas group, Sumatra), superbly carved in high relief in a panel on the base of a sanctuary. The supple and harmonious pose is close to Indian prototypes. This statue of a god particularly popular in the Vajrayāna sect is compared by F. M. Schnitger to works of the same kind in Bengal and Bihar, and because of the similarities he dates it in the 10th century. The head of a rakshasa in another sanctuary of Padang Lawas is beautifully proportioned. In contrast, the leaping and dancing figures on a base from the same complex (a 13th-cent. work in the stupa-shaped sanctuary of Pulo) show a verve and vigor which are much more uncontrolled; the grotesque heads, the hooked motifs that fill the background, the treatment in shallow relief, and even the style of the figures all spring from a different spirit and from tendencies that are more local and more popular. Such tendencies are found in some statues of stone and a few in terra cotta (particularly personages and rakshasas at entrances), and they are marked in the female figures that pour water from inclined pitchers into the bathing pools. They are particularly to be found in the reliefs of the period.

The decoration of bases with scenes in relief underwent considerable change in eastern Java. As a result of the height of these bases, often several stories, panels and friezes with many people were often placed one above the other. The reassertion of Indonesian tendencies grew stronger, and the evolution begun at Prambanam continued. The idealized, richly ornamented figures from Borobudur gave way to a slimmer type, often in more expressive but stiffer attitudes. The thinness of these figures was accentuated by the simple, short costumes, without draperies, which clung to the body. The rich diadems were usually replaced by bouffant coiffures which framed the almond-eyed faces. Though the relief was still deep and lively at Djalatunda (end of 10th cent.), it became uniform and projected less in the works of the later styles of Singhasāri (13th cent.) and of Majapahit (14th cent.). At Panataran, in Candi Jago, and other sites, the compositions became more awkward and the groupings cruder. The bodies were flattened, the broad shoulders strictly horizontal, the gestures angular, and the figures juxtaposed in lines, or intermingled without order in the more violent scenes. There was a tendency to treat the figures in silhouette, as can be seen in the decorative motifs of Candi Rimbi, and in the large base of Panataran (14th cent., PL. 35) and other reliefs of the same monument. This tendency became more and more frequent in the Majapahit style. The hooked motifs — stylizations of clouds and vegetation — were mixed with the diverse creatures and tended to overrun the surface. Several heroes, such as Arjuna, remained richly appareled, but many figures were of a more popular type. The fantastic appearance of the rakshasas was further increased. The themes were especially those of the great epics and legends taken from India, in particular those of the *Rāmāyaṇa* and of the *Mahābhārata*, which continued to be equally in favor in Bali. Popularized in Javanese versions of these poems, Rāma and the five Pāṇḍavas became practically national heroes and appeared in changed forms.

In spite of recurring tendencies, differences arose in the works at the various sites. At Candi Keḍaton, a certain degree of modeling was long retained; the scenes are animated and human beings are dominant. A certain realism is apparent in the expressive gestures and in well-observed details (such as the pose of an old man who leans on a long stick). At Candi Rimbi, the decoration spread as the human element became less important. At Candi Suravana flattened silhouetted figures, still expressive, are spaced out among fantastic forms along with a profusion of stiff and stunted trees, the carved foliage of which varies the effects and indicates the species. The figures are also varied; some are ornamented, while others, short and fat, have a more primitive look. Some more slender female figures possess a wholly indigenous grace. The tendencies found here occur later in Bali with a triumph of the decorative elements.

The reliefs from Trawulan in the museum of Mojokerto are in quite a different spirit; they are devoted especially to the representation of landscapes in which naturalistic trends can be discerned, and it seems that only a certain lack of skill hinders a search for definite realism. Human figures are rare and are rather lost in the natural setting. The landscape is at the same time intimate and immense; a vast distance is suggested by the

UP State Museum, Lucknow

succession and overlapping of the rounded summits of mountains topped with trees, but rustic dwellings are pictured in their enclosures, and rocky streams wind through the valleys. Here the impression of immensity and solitude that emanates from the Chinese Sung landscapes seems to have been translated into a simple, popular language. It is possible that the embassies which were constantly exchanged between China and Indonesia effected some transmission of Chinese influence. (These relations were only temporarily interrupted by the expedition sent by Kublai Khan in 1292, and they multiplied thereafter.) This preoccupation with the elements of nature represents the culmination of a long line of works in which they were progressively introduced. The depiction of mountains, which had not occurred earlier, coincided with a resurgence of the native beliefs and cults of Indonesia in which the veneration of sacred places on mountain tops played an important part. This group of works remains, however, rather exceptional.

LATE PERIOD. The decline of the Majapahit kingdom, from the first half of the 15th century, led to a slowing down of artistic production. In the face of the progress of Islam, the Hindu cults lost their preeminence, and their votaries retired to the mountains, where indigenous cults had often been established and where the Hindu beliefs — in the Saiva form — began to mix with the ancient local religion and with its rites. On the mountain summits (Lawu, Penanggungan, and others), various temples were consecrated to this bastardized Hinduism. They usually took the form of terraces supporting sanctuaries, which have yielded examples of sculpture and decorative elements, as in the case of Candi Sukuh (mid-15th cent.) on Mount Lawu. The works of this site were still of good quality; for example, a rough masculine head is well proportioned, expressive, and sober.

In spite of the success of Islam, the earlier architectural traditions were maintained in Java. They can be seen in buildings designed for Moslem purposes, as in the minaret of Kudus and the mosque of Sendangduwur, brick constructions which retained the architectural characteristics of eastern Java. At Kudus, the very tall base with juxtaposed panels and superimposed cornices raises the central structure to a great height, and the horizontal band which divides it halfway up is retained. The two types of door already described are used in the various walls at Kudus and Sendangduwur. The abundant ornament making use of living forms has disappeared, although a large motif of outspread wings framing the gateway at Sendangduwur proves the persistence of earlier decorative elements. The strongest survivals of the earlier Indonesian traditions are to be found, however, in Bali (see below), where Hinduism remained the prevailing religion.

During this last period, mosques and the surviving later palaces (*kraton*) were built of wood. These structures followed a quite different tradition from the stone buildings, but one which could also have been ancient, as at all times wooden buildings had accompanied and completed those built in brick or stone. Palaces as well as small buildings had always been constructed of wood, and the reliefs at Borobudur depicted pavilions where thin columns held up roofs that were often overhanging. The *kratons* of Jogjakarta or of Surakarta, which go back no further than the 18th century, consist of a long succession of rectangular courts containing separate buildings. The halls and throne rooms are covered with a large, steeply sloping tiled roof; the central part is supported by very tall painted pillars, while a double rectangle of columns, also of wood, sustains the outer part of the overhanging roof.

ART OF BALI. Indian influences arrived early in this small island, whether transmitted directly or by way of the Central Javanese styles. While certain parallels with Javanese art may be discerned, as in the 11th-century complex of Tampaksiring and in various sculptures, the art quickly took on a local character. This hybrid aspect is manifested during the late period in a mélange of borrowed forms and indigenous tendencies. With the persistence of Hinduism in Bali, a religious architecture in wood still continues ancient traditions.

The temples (*pura*) of Bali, high wooden structures with superimposed roofs reminiscent of pagodas, are often called "merus" because they symbolize Mount Meru, the cosmic mountain. These structures preserve ancient forms which are perhaps distantly Indian in origin, though they have disappeared elsewhere; representations of them in Javanese reliefs show that they must once have existed in other parts of the archipelago. Sanctuaries of this type have multiplied in the island, generally accompanied by a group of lower buildings, also of wood. Sometimes, as in the Pura Ye Ganga near Perean (ca. 14th cent.), the lower part is made of brick. Brick was particularly used, however, for the enclosure walls and the gateways; the latter were greatly emphasized in Bali and were often of considerable size, even to the point of becoming the principal architectural element. The two types of entrances seen in eastern Java recur, in both cases with a narrow opening. The multiple stories of their superstructure give these doorways an effect of height which is increased by the steps, often numerous, above which they are elevated. Cornice moldings of the angular type survive on the walls as well as on the various parts of the doorways. The relief decoration also reappears, sometimes sparingly used, elsewhere in profusion. Representations either in the round or in relief of fantastic creatures seem often almost to overload the sides of the entrances. These motifs sometimes overflow to the ends of the superstructure and greatly enliven the silhouette. The ornament becomes increasingly independent of the architectural forms; the proliferation of this decoration and of the sculpture is in some cases so extreme that it seems decadent (Pura Bedji at Sangsit). Color effects are often sought, the various elements being painted in brilliant tones. This desire for color led at Pura Kehen to the insertion of Chinese porcelain plates in the masonry. The number of temples in Bali is very great; among them should be cited those of Sangsit, Bangli, Batur, and Kesiman.

Madeleine HALLADE

The outstanding examples of Balinese ornamental wood carving are the magnificent reliefs on the large wooden doors of temples and princely mansions. They consist of lotus motifs and "rococo" scrolls representing rocks, interspersed with figures from Indian myths and epics (PL. 37). Sculptures in the round of gods and mythical beings are mostly rather conventional and show a predilection for grotesque demonic figures; in contrast, human and animal figures are frequently of a lively and striking realism, tending toward humorous caricature.

The art of painting survived in Bali, while in Java it succumbed to Islam. Large paintings (PL. 32) in wayang style on wood or cotton cloth take their subjects from Indian mythology and epics and from the ancient romantic literature of Java. Illustrations of palm-leaf manuscripts, incised with an iron stylus, testify to the extreme grace and refinement of traditional Balinese art. Bali also possesses rich metal and textile arts comparable to the Javanese and Malayan production described below.

Unlike most areas where indigenous arts prevail, wider contact with the outside world led to an almost miraculous renascence in Bali. The art had not been crippled by the impact of Islam; sculpture and painting were still living arts, and, moreover, the whole population was imbued with a deep esthetic feeling. When, as a result of outside influences, the old traditional ties of society and culture began to loosen, the time was ripe for the creation of new expressions in art.

In painting the new trend was initiated by the influence of a German painter, Walter Spies, who lived in Bali from 1927 to 1940 and who had been inspired in his youth by the paintings of Henri Rousseau. Only one Balinese painter, Anak Agung Gde Sobrat, actually worked with Spies, although others may have seen his works. This very slight stimulus resulted in the practically explosive birth (ca. 1930) of a completely new and yet thoroughly Balinese school of painting. While it takes its subjects largely from daily life — the rice harvest, village scenes, festivals, and funerals, it draws also from the epics and legends. The art, which excels in its original com-

UP State Museum, Lucknow

positions and decorative values, ranks among the outstanding interpretations of tropical nature and life.

At the same time, in 1930, two wood carvers, I Tegelan and Ida Bagus Ketut Gelodog, created a new style of sculpture which was immediately adopted by many other artists. Some of their works are realistic, others fantastically stylized, with extremely slender bodies and exaggeratedly thin arms and legs. They look very "modern" in the European sense, although none of these Balinese artists was familiar with modern European sculptures. In more recent years there seems to have been a tendency toward a syncretism of the new and traditional styles.

MINOR ARTS. When Islam replaced Hinduism and Buddhism, the building of temples and the sculpturing of images came to an end, but the old style survived in the minor arts and even reached new heights. With the spread of Islam it was, moreover, diffused to peoples who had never adopted Hindu-Buddhist culture.

Wood carving is completely dominated by stylized plant ornaments, baroque derivatives of the ancient Indian lotus motif. Similar plant scrolls are used in the decoration of metal objects, mostly of brass or silver, but with the addition of flower patterns of textile origin and, in Java, of human and animal figures in wayang style.

Excluding tribal arts, which are discussed in the first sections, three classes of art object deserve special notice, krises, wayang puppets, and textiles.

The oldest type of kris, with hilt and blade forged in one piece, the hilt being formed by a human figure in the style of primitive ancestor images, is traditionally ascribed to the time of the kingdom of Majapahit. Actually, it must be far more ancient and may be derived from a type of bronze dagger with a human figure as hilt which has been found at Dông-s'on. The kris with hilt of wood, ivory, or gold came into fashion prior to the foundation of Majapahit — in the 13th century at the latest, and perhaps earlier. The oldest types of such hilts seem to be those representing either a demon, originally perhaps the man-eater Kalmāṣapāda of Buddhist and Hindu legend, or the man-eagle Garuḍa. Both kinds are still widely found, but in many instances the figures have been so stylized that they have degenerated into a maze of branches and leaf patterns or have become more and more simplified, assuming almost geometric forms. Other varieties of kris hilts are probably of more recent origin. The blades have a distinctive pattern (*pamor*) which results from their being forged from several rods of iron, some of it meteoric in origin, and occasionally they have decorations inlaid with gold. It was probably during the expansion of Majapahit (14th cent.) that the kris spread from Java to the Malays of Sumatra, Malaya, and Borneo, to Bali, and to the Buginese and Makassarese of Celebes.

Because of their graceful stylization and their rich and delicate *à jour* decorations, the painted puppets cut from parchment for the shadow play (*wayang kulit*) rank among the most attractive products of Javanese art. Whether the shadow play originated in Java or was introduced from either China or India, the style of the puppets is no doubt derived from paintings more or less similar to those still found in Bali and particularly to those on the scrolls of the Javanese *wayang beber*. Since this style does not seem to be of Indian origin, it might have been derived from Dông-so'n painting, perhaps through the medium of ancient Javanese folk art. Its influence appears first in reliefs of the 13th century.

The techniques of textile decoration comprise brocading, *ikat*, *plangi* (tie-dyeing on the finished tissue), and batik. The outstanding gold brocades are those from Palembang in Sumatra. The origin of the Javanese batik technique has been the subject of much discussion, but the problem has not been solved; it was used in India, as well as in ancient China, and is still practiced by some hill tribes of southern China, northern Indochina, and the island of Hainan. In Indonesia, primitive varieties of the technique survive in western Java and among the Toradja of central Celebes. They may have been introduced from the mainland at the same time as the warp *ikat* technique (i.e., in the Dông-so'n period). It is possible that, like *ikat*, batik came to Java twice, first from the north and later from India. In any case it was developed in Java to a degree not surpassed anywhere else. In recent times it spread from Java to eastern Sumatra and to the Moros of the Sulu Islands. The designs of Javanese batiks excel in their variety and their high esthetic quality. They comprise flower and plant patterns of Indian origin, Chinese phoenixes, cloud designs, and even patterns derived from Dông-so'n spirals, but all of these have been stylized in a typically Javanese manner, while numerous motifs of local invention, such as wayang figures, peacocks, and birds' wings symbolizing Garuḍa, have been added.

EUROPEAN INFLUENCES. Although some effect of the Dutch baroque can be seen in Javanese wood carvings, and stray motifs of European origin may be found on such work as Sumba *ikats* and Madura kris hilts, early European influences were negligible on the whole. In the 19th century a Javanese painter, Raden Saleh (1814–80), achieved some fame, but his works are purely European in character and reveal the influence in his youth of the French school, particularly of Delacroix and Géricault. As in many other areas of the world, contacts with Western civilization in recent times have been detrimental to the indigenous art of the Indonesian peoples, with the exception of Bali, where, as noted above, conditions were particularly favorable. The developments of the 20th century, when modern Indonesian art began strongly to reflect a Western impact, are treated under ORIENTAL MODERN MOVEMENTS. The buildings constructed under Dutch and English influence and, more recently, in international style are outlined under INDONESIA.

CONCLUSION. An attempt has been made to trace the origins of the various art styles of Indonesia and to determine their sequence in time. Only on the basis of such a historical analysis can an understanding of the puzzling variety and the contradictory tendencies noticeable in Indonesian art be achieved.

There can be little doubt that the monumental style was introduced by the Indonesians themselves when they migrated to the islands, probably in the 2d millennium B.C. But the most decisive impulses, those which helped to create most of the local art styles of Indonesia, came from the Dông-so'n culture of Indochina at some time between 700 B.C. and the end of the pre-Christian era. During the same period, probably in the 4th century B.C., contacts with people from China resulted in the birth of those art styles which still survive in central Borneo and among the Ngada of Flores.

In the Christian Era the northern influences were superseded by those from India, which resulted in the creation of the Hindu-Buddhist art of Java, Sumatra, and Bali. Moslem influence was mainly negative, but the very fact that religious architecture and sculpture were suppressed may have spurred the creative spirit to seek outlets in the minor arts and thus have caused their flowering in recent centuries. It has long been recognized that the ancient art of Java, although derived from India, was not Indian but Javanese. The same applies to the ornamental styles of Indonesia, as well as to the new school of art of Bali. The foreign models were not simply copied but gave rise to new, original styles. Therefore all Indonesian art styles, of whatever period and origin, may be said to be genuinely Indonesian in the same sense that German and Italian Gothic are — despite the French origin of the Gothic style — German and Italian, and the French and German Renaissance styles are genuinely French and German, even though they resulted from stimuli emanating from Italy.

INDUSTRIAL DESIGN.

This term is applied to the artist's plan for goods to be manufactured in series by fully mechanized processes. In contrast to handicrafts (q.v.), in which esthetic form is created in the process of fashioning the object and no two objects are quite identical, the artistic effect of machine-made products is achieved either in the original design or in a working model that serves as a pattern for succeeding objects in the series, which are produced without variation. The industrial designer may be responsible for the complete product, in the case of static objects such as glassware or furniture; in products with mechanical, electrical, or electronic operating parts, such as typewriters, automobiles, or radios, he may provide the envelope, the exterior form, for the combined inventions of many technicians. The discussion here is limited to objects that contain some three-dimensional elements; industrial-design processes related to the graphic arts (q.v.), to textiles (see TEXTILES, EMBROIDERY, AND LACE), etc., are treated elsewhere in these volumes. (See also DESIGN, DESIGNING, and the chapter *Machine technology* in AMERICAS: ART SINCE COLUMBUS, I, col. 328.)

SUMMARY. *The concept of series and the standard; Theoretical premises; Relationships among industrial design, handicrafts, and fine art; Relationship between industrial design and industrialized architecture; Novelty and obsolescence; The "symbolic" function of the industrial product; Styling; Fashion; Advertising; Teamwork; Duties and functions of the designer; Historical origins; William Morris and the Arts and Crafts movement; From Van de Velde to Muthesius; From the Bauhaus to the present; Teaching of industrial design.*

The concept of series and the standard. Industrial production involves production systems or processes used in operations of a repetitive nature in which each phase of work is precisely regulated and organized in such a way as to permit the reproduction of sets or series of objects (in contrast to craft production, in which control is slight or not at all precise and does not result in series of exact duplicates). The concept of series is basic to an understanding of the nature of industrial production. Series implies the possibility of reproducing a given model which possesses "in the greatest measure that collection of characteristics necessary to its use as a pattern in producing copies by series operations, and which is made up of standardized parts" (Ciribini, 1958). Such a model or matrix becomes the standard, or norm, in the production of the object.

Production in series refers to the method of production rather than the quantity of goods produced, provided the quantity is more than one. Some industrially produced items such as locomotives or ships are made in relatively limited numbers; others, like plastic dishes or household appliances, are mass-produced. But in all these cases the production process is one of repetition.

The concept of the standard, or norm, arose with the advent of the machine as an instrument capable of multiplying a given model indefinitely. This concept illustrates one of the most striking transformations in the attitude of the public toward a work of art: no longer does the object's uniqueness or the skill of the artisan matter; only the design is important — or rather the conception of the designer that existed before the

mechanical execution. A strictly serial production of copies, each identical with the next, was practically unknown before our own time; every product of handicraft, even when most accurately made to specification or constructed with the aid of machines such as the lathe and auger, always had limited precision and contained an element of chance in its form. The amount of imprecision admissible in objects produced in series is entirely different from the amount admissible for handicraft products; in the latter, inexactness, far from being a defect (as in industrially produced articles), is usually a positive value.

To conform to the standard, the industrial object must be planned as complete via the act of production; it must not undergo later manipulations. For this reason it is difficult to include a good deal of modern furniture under the category of industrially produced goods. Such furniture is only in part produced on a standard model, the finishing and hand polishing being done later.

Theoretical premises. Industrial design as we have defined it has its theoretical basis in certain esthetic principles found in Kant and still earlier in the English empiricists. For Kant there are two kinds of beauty: free beauty (*pulchritudo vaga*) and dependent beauty (*pulchritudo adhaerens*), the latter involving the purpose which the object is to serve. Purpose for Kant is an a priori principle of the esthetic faculty. It is identified with function, and the appropriateness of the object to its purpose (the "fitness" of the empiricists) is identified with its perfection. Kant discusses "painting," but within this category he includes the decorative arts, furniture, and interior decoration — genres in which the concept of purpose dominates.

The idea of functional beauty is usually considered anti-Kantian and closer to the eclectic naturalism of late-19th-century philosophy. But it should be pointed out that Kant adapted the idea of purpose to his own theory, holding that beauty could be contingent on purpose and that purpose could be implicit as well as explicit. (See ESTHETICS for a fuller treatment of Kantian esthetic theories.)

In the English empiricists, especially in Addison and Burke, we find an attitude toward the art object that can properly be called "functionalist." Burke states: "When we examine the structure of a watch, when we come to know thoroughly the use of every part of it, satisfied as we are with the fitness of the whole, we are far enough from perceiving anything like beauty in the watch-work itself . . . . In beauty . . . the effect is previous to any knowledge of the use; but to judge of proportion [for Burke an element of beauty], we must know the end for which any work is designed" (*A Philosophical Inquiry into . . . the Sublime and Beautiful*, 1756). This quotation indicates the distinction still made by Burke between beauty and proportion (as an element of beauty) on the one hand and fitness and knowledge of use on the other. We already glimpse here the beginnings of that long debate which sought to equate or to contrast the useful with the beautiful or to subordinate the useful to the beautiful while integrating the two concepts within that of function.

The concept of function underwent considerable expansion in the last decades of the 19th century and during the first half of the 20th. Originally understood in a strictly utilitarian or materialistic sense, the concept developed increasingly greater psychological overtones. This expansion of meaning has resulted in statements such as those of Paul Souriau that "there can be no conflict between the beautiful and the useful" (*La Beauté rationelle*, Paris, 1904, p. 198), and "a thing is perfect when it is in conformity with its purpose" (*ibid.*, p. 195). Such beliefs recall the early struggles of architectural rationalism when Adolf Loos was proclaiming his "Ornament und Verbrechen" (ornament and crime) and Louis Sullivan held that "form follows function." Numerous battles were waged by both architects and critics over the extent to which beauty in architecture should be subordinate to functionality; but these discussions are by now empty of significance, particularly with respect to industrial objects, whose real existence began much later. Today it is generally accepted that the artistic component in an industrial product is only partly related to its material utility, and that industrial design as a whole cannot be brought entirely within the area of the so-called "fine arts." In the twenties, however, during the time of the Bauhaus, beauty and utility in industrial design were regarded as necessarily joined. That there could be utilitarian objects in which stylishness and advertising requirements were the sole determining factors was not considered possible.

Another common assumption previously held was that from the point of view of esthetic value an absolute comparison could be made among handicrafts, works of art, and industrial objects. This position, too, has undergone revision. The esthetic constants characteristic of an industrial object can most readily be identified by an analysis of the relationships among industrial design, handicrafts, and fine art; and between industrial design and industrialized architecture.

Relationships among industrial design, handicrafts, and fine art. It is undeniable that the forms of many industrial objects show obvious affinities to those of modern sculpture and painting. In fact, fine art has had an appreciable influence on industrial art, just as industrial design has in turn influenced fine art. If we accept the fact that a complete separation between applied and fine art can no longer be maintained, and if we accept modern architecture (even if prefabricated) as a form of art, then we must also accept industrially produced objects as art, at least in part.

Yet a clear distinction must be drawn between industrial design and handicraft design as separate genres, each with its own special requirements, in order to avoid regarding one as more valid or more artistic than the other. Handicrafts are increasingly becoming a subproduct of fine art, that is, taking on the characteristics of material preciousness and uniqueness that distinguish painting and sculpture. Handicrafts are being leveled to that type of production in which the touch of the hand is obviously of chief importance. Objects that are better and more easily made by machine, however, will scarcely be made by hand.

At this point some questions arise: Why is it that obvious analogies of form and inspiration could be drawn, not long ago, between industrial products and objects of art (e.g., the well-known early Eames chair, certain products of Aalto and Wirkkala; sculpture by Arp or Noguchi), but subsequently such similarities practically disappeared? Also, to what can we attribute the fact that during the Bauhaus period constructivist abstraction and neoplasticism in fine art showed clear resemblances to industrial forms, but today there is little affinity between industrial design and the free painting and constructions of such artists as Jean Fautrier, Antoni Tàpies, Alberto Burri, or César (Baldacchini)? One explanation serves for both these questions: In the representational arts the increasing use of the machine has resulted in the reproduction and dissemination on a vast scale of extremely poor material such as comic strips and cheap magazine illustrations, which have little in common with real modern art. Partly as a reaction against this flood of material, tendencies have developed in post-World War II art toward a greater expressive and formal freedom. This development in fine art has few points of contact with the necessarily sober and exact forms of contemporary industrial design.

Today the industrial object is the only product of any artistic content that is in contact with a wide public and not merely with an elite. For this reason it must be the responsibility of industrial design to encourage in the masses a sensitivity to good artistic form, which otherwise threatens to be overwhelmed by the widespread contemporary pseudo art disseminated by the machine. More than handicrafts or fine art, industrial design has the influence to educate the public and reawaken it to the genuine values of modern art and architecture.

Relationship between industrial design and industrialized architecture. This relationship has often been misunderstood and has frequently given rise to false interpretations and comparisons

The matter deserves clarification because of the ever-increasing expansion of architecture produced by industrial means. The concept of industrial design cannot be extended directly to architecture, city planning, complex organisms such as naval or railroad constructions, or giant industrial installations; although these structures derive from fully mechanized methods of work, they are not produced in series through repetitive operations. Included within industrial design, however, are all those elements of modern architecture produced by standardized means such as curtain walls, fixtures, installations, and fully prefabricated structures which need only be assembled and in which all the basic work has already been done in the factory. Among such prefabricated structures are the well-known geodesic domes and dymaxion houses of R. Buckminster Fuller (PL. 62) and the joints and other modular elements of Konrad Wachsmann's constructions (IV, PL. 196). An architecture composed entirely of prefabricated elements, or entire dwellings created by the repetition of a single basic unit, is theoretically possible in the not-too-distant future; the basic-unit method has been followed in the single-family plastic houses designed by J. Johansen in the United States, in the Monsanto Chemical Company's House of the Future, Los Angeles, and in the house of resin planned by J. Shein in France. Such architecture would, of course, fall entirely under industrial design.

But even if most future construction could be prefabricated, which is doubtful, the basic factors of planning and topographical layout would still place architecture partly outside industrial design. Close and significant relationships do exist, however, between industrial design and contemporary architecture.

Novelty and obsolescence. A highly debated problem is the role played by novelty of form in the industrial object. While novelty enters as a factor into all works of art, it is particularly important in industrial design. It is linked to concepts of information and the consuming of information as they apply to industrial forms.

The recently developed esthetics based on the theory of information, and the acceptance by certain scholars such as Max Bense and A. Moles of criteria borrowed from cybernetics to account for the phenomenon of a consuming or using up of information (that is, the concept that artistic forms undergo entropy and obsolescence due to overfamiliarity), have their sources in 18th-century esthetics, particularly in the work of the empiricists — a fact that has been insufficiently stressed. Basically the concept of entropy of communication (Norbert Wiener), when applied to objects of common use or to any other visual form, repeats in different words and with more precision ideas clearly hinted at by 18th-century English philosophers. In the modern formulation of the concept of entropy of information, it is held that the maximum amount of information is furnished by the message or form which, by its newness, unexpectedness, and unforeseeableness, produces the maximum amount of surprise (since the amount of information imparted is in direct proportion to its degree of unforeseeableness); so that when the message or form is repeated too often, the effectiveness of its stimulus gradually lessens until a minimum of information is obtained from it. Addison had already defined the problem when he stated that new and unusual things give delight to the imagination because they fill us with pleasurable surprise. We find in Burke the following: "Indeed beauty is so far from belonging to the idea of custom, that in reality what affects us in that manner is extremely rare and uncommon. The beautiful strikes us as much by its novelty as the deformed itself . . . . For as use at last takes off the painful effect of many things, it reduces the pleasurable effect in others in the same manner" (*op. cit.*). Here we already find the belief that novelty is the source of esthetic pleasure, while overexposure to a given form results only in boredom and aversion.

Various institutions in contemporary culture play a part in the speed of obsolescence of industrial forms (see below, discussions of styling, fashion, and advertising). Whether such speed is esthetically beneficial is difficult to say; it is, in any case, typical of the mid-20th century for purely artistic as well as so-called "useful" forms.

Concerning the role of novelty and obsolescence in industrial production as opposed to the fine arts, in industrial production novelty and exposure to form are primary factors; they are vital to the success of the product. In painting, sculpture, and architecture, however, obsolescence and aging are less significant; and unexpectedness alone is not sufficient to create validity in terms of the art form. Thus certain esthetic principles currently applied to the visual arts — for example, that aging adds beauty to a work — do not apply to industrial design. This particular principle is most fully embodied in the esthetics of Zen, in which the various states of artistic deterioration and incompleteness that add merit to a work are expressed by the terms *wabi* (Jap., apology) and *sabi* (Jap., rust tarnish). The same principle is common in Western esthetics as well, as in the familiar notion that the patina produced by aging adds to the beauty of an ancient sculpture. But the industrial object is made for an immediate practical and esthetic satisfaction that is strictly related to the object's purpose. While it is possible to imagine an increase in the value or beauty of an industrial object due to age, wear, or change in taste (as has already happened with products of the last century or with old locomotives and automobiles; PL. 43), such a change in value is the result of factors which are extrinsic to the object itself and which are therefore not relevant to our analysis of industrially produced work. Use of an industrial product as a piece of scrap in the construction of a work of fine art similarly has no bearing upon the purpose and value of the original object.

The "symbolic" function of the industrial product. "Symbolic" here refers to the manner in which the shape of an object clearly expresses its purpose and is not related to the theories of such philosophers as Ernst Cassirer or Susanne Langer, who hold that art is always a symbol of something. In our use of the term, an industrially produced object contains an element or elements that symbolize its function. These elements of meaning are introduced into the object's form, underscoring its general appearance and at the same time effectively serving to point out the characteristic function of the object. Frequently this function needs to be emphasized; it must be made to seem attractive or significant to the consumer. Occasionally, however, the function of the product is deliberately disguised or concealed by the outer form. This often occurs when the internal mechanism of the object might produce an adverse or undesirable psychological effect.

Styling. Styling serves to make a product more appealing by giving it a bright new form when its old appearance has ceased to please. Related to basic social and ethical requirements within the culture, styling and styling changes go hand in hand with changes in the symbolic elements of objects. Styling is to be distinguished from fashion, which, although exerting some influence on styling, is connected primarily with an ephemeral need for change and distinctiveness and is more directly related to the demands of the market.

Thus in a period when aerodynamics is of dominant interest, even static objects may be styled with aerodynamic forms, as numerous examples testify. Similarly, when angular lines predominate, semimobile or dynamic objects tend to be styled in an angular manner. Various stylistic changes have occurred in industrial design, from the early rationalistic, rectilinear surfaces to the aerodynamic forms of the 1930s and 1940s, the "enveloping forms and tactile surfaces" (Francastel, 1955) of the postwar period, and the later return to more angular and geometric shapes that at times resemble certain aspects of Art Nouveau (q.v.).

Styling is without doubt one of the most controversial aspects of industrial design, and the practice has been severely criticized. It is still held in low esteem, particularly in England, but is now widespread wherever industry has been highly developed. The concept originated in the United States, with its advanced level of industrialization and high standard of living, and it was there that styling first became established.

Reyner Banham ("Machine Aesthetics," *Arch. Rev.*, 117, 1955, pp. 225–28) has stated that styling and most of the formal

UP State Museum, Lucknow

aspects of industrial design can be placed in the category of popular art as defined by Leslie A. Fiedler ("The Middle against Both Ends," *Encounter*, August, 1955, pp. 16–23). There is some truth to this statement, for industrial design comes into contact with the masses as no other art form in our time. However, the popular art of the past was always in some way related to the fine arts. Today this relationship is almost nonexistent; the phenomenon of a popular art entirely divorced from cultivated art is the unhappy prerogative of our own age. Thus Pierluigi Spadolini's contention — that art in the past was confined to a narrow, aristocratic society and was therefore "a highly individualistic pursuit permitted to few" (1960, p. 85) — is questionable. It may be argued that although the art of antiquity was fostered by the privileged, its enjoyment was almost universal — certainly more widespread than today, when genuine art is restricted to a tiny elite.

Fashion. Fashion, as we have observed, is related to fluctuating needs (such as immediate market demands) for new and distinct forms — needs based on factors other than the more basic ethical and social requirements of the culture that shape the true style of a period. The instability of form of the industrial object, caused by (and causing) rapid consumption, reflects considerations of fashion, advertising, and competition.

A useful distinction has been made by L. D. Kalff ("La Mode dans l'esthétique industrielle," *Esthétique Industrielle*, 28, 1957) concerning the role of fashion in various types of industrial products. Kalff separates products whose forms are primarily functional and are derived from their technological character and products whose forms are decorative and are derived from their affective character. In the first category the author places high-tension wires, street lamps, trains, and other goods of a public rather than private nature, not generally found in stores; a few items for private consumption such as sports equipment, radiators, and ventilators are also included. In the second category are products whose forms are strongly decorative, such as automobiles and household appliances, and products whose functional character is entirely subordinate to the decorative, such as glassware and toilet articles. Where the product is impersonal and the element of personal competition of the consumer is lacking, as in the first category, fashion tends to play little or no role in the design. But in objects of a highly personal nature, as in the second category, fashion becomes extremely important; the relative impermanence of these objects plays a significant role in their submission to fashion. The distinctions drawn are somewhat arbitrary, but they also hold true for goods designed in limited numbers for governmental or industrial use as compared with goods produced in great quantities, which rapidly become obsolete. (A similar analysis has been made by Werner Graeff in *Über Formgebung*, Rat für Formgebung, Darmstadt, 1960, the official organ of German industrial design.)

The phenomenon of the custom-made object — that is, the object produced out of series — is also, somewhat paradoxically, related to fashion. Spadolini suggests that one reason why special models are produced is that they contain innovations that may later be extended to mass-produced objects of a similar type: The phenomenon "pertains only to objects whose use and enjoyment may be extended to other people; that is, automobiles are custom-made, but not electric razors" (1960, pp. 81–83). We can regard custom building, for example, as a prefashion phenomenon — an early stage of a fashion which has not yet become generalized.

Advertising. Rapid obsolescence of industrial forms in the 20th century is due in part to the enormous development of advertising (see PUBLICITY AND ADVERTISING), including advertising art and publicity directed toward the industrial object. The industrial object plays a special role in advertising, functioning both as advertising art and as indirect publicity for other items in the series. The product of industrial design, as we have seen, also partakes of certain aspects of pure art.

One difference between advertising art and pure art is that the latter advertises itself only, while the former directs attention primarily to some other product. Like pure art, the industrial product is self-advertising; but like advertising art, it functions as a representative of a class of objects, publicizing other identical objects. The industrial product in its advertising role is subject to all the laws governing advertising. It must therefore be highly informative and, to remain so, must continuously renew itself to avoid the information consumption that would render it ineffective; as advertising, the industrial object shows changes due more to fashion than to style.

It should not be assumed that the attribution of an advertising character to industrial design necessarily depreciates its artistic value. Rather the ready adaptability of the industrial product to changes of fashion permits to a high degree the anticipation of new trends, which is desirable in even more specifically artistic forms.

Teamwork. Another characteristic of industrial design that distinguishes it from other art forms is its necessary dependence upon specific requirements of industry. Although the thesis has often been advanced that a designer should be free of all outside restrictions and allowed to work independently, such a condition is obviously impossible; no industrial product can be the pure invention of the designer. Even when the designer is given a free hand, he still feels restricted by the possibility of the failure of his product, should it clash with public taste. While novelty in the industrial product is essential for sales, it must conform to the requirements of the market and production. In painting and sculpture the opposite is true: going against current taste is often the way to greatest success.

These special considerations in industrial design point to the necessity for teamwork. Although the designer may work alone as the creator of a given form, his invention can rarely be realized without the help of many people in direct contact with the various phases of production and the market. Group work, however, inevitably affects the designer's originality, freshness, and initiative. Some of the finest products, today as in the past, are the result of individual work done without outside interference. An example is a black paper knife designed by Nizzoli in 1959, which was given away as an advertisement by the Olivetti Company. It was produced in series with modern material, and though its functionality is somewhat doubtful, it fully meets the formal requirements demanded of an object of industrial design; and it approaches, in a surprising way, pure sculpture. But such an object is not typical of industrial design; it is rather an exception to the rule that teamwork and functional operation are necessities in industrial production.

Duties and functions of the designer. The duties and functions of an industrial designer within the framework of a single industry are extremely complex, but they can be summed up in a few essentials. First it should be emphasized that the designer is not merely a draftsman — a technician specializing in accurate finished renderings of a given subject — but a creative planner with true artistic ability, who has full knowledge of the task he is undertaking. One of his first duties, therefore, is to analyze and organize the data obtained from a vast team of scientists, technicians, engineers, statisticians, market analysts, and production specialists and to draw from this material the conclusions necessary to determine the type of product he must create. It is desirable that the designer have a technical staff at his command, not only to aid him in analyzing the pertinent data without which his creative imagination is ineffective, but also to help improve or change the product.

Demand for novelty in an item can be a by-product of scientific and technological discoveries or of new ways of using old tools and procedures. In this connection the designer has a truly creative function, both as an artist and an inventor. Through his knowledge of existing products and methods and the demands of the public, he may create an object in a new form, utilizing new technological advances or personally developing a technical innovation. Examples of technical innovations first introduced by designers are the extreme delicacy of certain watch mechanisms, the portability of transistor radios, and the

UP State Museum, Lucknow

transparency of various coffee machines. With respect to the inventive role of the designer, Arthur BecVar has stated: "Design in its initial planning stage is the thinking about problems, not their solutions . . . finding out if the problem has been clearly stated and is understandable to the people concerned" ("The Designer's Answer," *Design Forecast*, 1, 1959, pp. 54–57).

One of the chief duties of the designer is, as we have seen, to create by means of styling and redesigning new models and forms for the market — new, at least, in their external appearance. Suitability of form must also be considered; an item that is not a redesign of a model already on the market must, from its first appearance, present all the necessary requirements of intelligibility and self-symbolization. It is indispensable that the product be immediately comprehensible to the public which is to use it and which has not yet seen it. The product must not be disguised in an inappropriate form or be easily confused with an already established product. In short, the object must possess from the start a distinct personality of its own. To achieve this is one of the designer's most critical tasks, and everything depends upon his ability to carry it out.

Historical origins. It has frequently been argued whether the term "industrial design" can be applied to products preceding the industrial revolution, and whether one can properly include within the category of industrial design objects made in antiquity with the use of rudimentary machinery. Many scholars have sought to classify ancient tools and objects such as shovels, picks, hammers, amphoras, bells, and furniture as examples of industrial design. Such an enlargement of the concept, however, does not seem justifiable. In the distant past the elementary employment of the machine always introduced some uncertainty into the repetitive aspects of the work. Products could not be made identical in every case, and no real standard could be established. For this reason industrial design as such began only with the advent of a genuine standardization of product, where tolerances were kept to a minumum. The initial stages of the industrial revolution must therefore be considered the prehistory of industrial design.

The earliest goods produced industrially from designs specifically adapted to the new system of production appeared in the late 18th and early 19th centuries. They seem to embody an erroneous concept of what we now call industrial design: An attempt was made to disguise the functional character of the object by imposing upon it decorative details conforming to the taste of the period. This practice ultimately led to a profound crisis concerning methods of production and the artistic validity of the objects produced. An example of this early approach is John Nash's Royal Pavilion (1818–19) in Brighton, England; cast iron, the chief material of early industrial achievement was used, and the pavilion was decorated in the Orientalizing taste then in fashion. The pheasant cage (1808) by Humphry Repton, which was to be part of the pavilion complex, was similarly designed. Furniture makers Thomas Chippendale (ca. 1718–79) and Thomas Sheraton (1751–1806) continued to draw inspiration for their decoration from pre-existing styles and ornamental motifs, although they were mindful of the functional requirements of their products. To Sheraton belongs credit for the first attempt to organize a system of mass production. Josiah Wedgwood (1730–95), who contributed many technical and chemical discoveries to the ceramics industry and who dedicated himself with great inventive zeal to its problems of production, trade, and transportation, was also aware of the attractions of ornamentation. This can be seen in his later work particularly, after he became associated in 1768 with the merchant Thomas Bentley, a man of taste and culture. The two partners engaged John Flaxman and other artists to produce pottery designs inspired by ancient Greek prototypes (X, PL. 289).

The incongruity of combining such ornamentation with qualities of technical perfection, efficiency, and functionality (which by themselves can give a product some esthetic merit) becomes clear in the objects shown at the Great Exhibition of 1851 in London. The esthetic values inherent in industrialization and standardized production were first expressed in works of engineering: in exposition buildings, transportation systems, and utilitarian constructions of all sorts — works that made full use of such new building materials as iron. Among the earliest examples of these engineering structures was the Severn Bridge in England (1779), the first to be built with a single span, designed by J. Wilkinson and Abraham Darby; and the Sunderland Bridge, Durham, England (1793), based on designs of Thomas Paine. In other countries as well, early use was being made of the new building materials produced by industry. Victor Louis's Théâtre Français of 1786 in Paris, with its iron-framed tile roof, is one of the important 18th-century constructions in cast iron. Among the French buildings with iron construction in the first half of the 19th century are Les Halles of Victor Baltard and the Bibliothèque Ste-Geneviève (1843–50) of Henri Labrouste (q.v.), both in Paris. Labrouste's Bibliothèque Nationale (1853), Contamin's Hall of Machines (1889), and Eiffel's tower (1889; V, PL. 99) are important later-19th-century French examples with metal construction. Labrouste's approach to building is recalled in his statement: "In architecture, form must always be appropriate to function . . . . A logical and expressive decoration must derive from the construction itself" (*Souvenirs d'Henri Labrouste*, Paris, 1928).

Such an attitude toward building was more common in the United States than in Europe during the 19th century. Before 1850 industrially prefabricated parts were in wide use in the United States for building, as in Alexander Parris's Boston Market (ca. 1825). In 1848 James Bogardus built one of the earliest commercial buildings with a cast-iron front; and in 1854, in the Harper Building, New York, he introduced the first American rolled-iron beams. The new architectural trends that were developing between 1850 and 1880 culminated in the work of Henry H. Richardson (q.v.), architect of the Marshall Field Wholesale Store in Chicago (1885–87; I, PL. 84), and the vital group of Chicago architects comprising William le Baron Jenny, Holabird, Burnham, John Root, and the great Louis Sullivan (q.v.), teacher of Frank Lloyd Wright.

William Morris and the Arts and Crafts movement. William Morris (q.v.), guiding spirit of the Arts and Crafts movement in England, holds an equivocal position regarding the industrialization of art. His attitude was negative inasmuch as he essentially denied the machine, which he considered responsible for the artistic decline of the applied arts in his time; but his approach was also positive in that he saw and insisted upon the importance of giving esthetic dignity to even the most insignificant aspects of daily life. Morris emphasized that there is an artistic factor not only in pure art but in objects of common use as well. Unfortunately, his suspicion of the machine caused him to turn to handicrafts instead of industrial production as a means of educating the public through art. In this he was complying in full with the beliefs of John Ruskin (1819–1900) and the Pre-Raphaelites. The polemic that Ruskin and Morris long directed against machinework and technology is summed up in Ruskin's *The Seven Lamps of Architecture* (1849), in which he accuses the machine of having suppressed the joy of working. Morris was anticipating attitudes that were to be generally appreciated much later, when, in disgust at the meretriciousness of commercial products, he tried to teach his workmen to search out and exploit the individual beauty of different materials and when he personally saw to the designing of every detail in his Red House (built for him in 1859 by Philip Webb), from the wallpaper to the glassware. Morris's importance consists chiefly in the fact that he sought to give handicraft production a new vitality and direction of its own, refusing to imitate slavishly the designs of the past.

Although Morris himself never came to recognize the decisive importance of the machine as a new and revolutionary means of production even in the field of art, this awareness was present in some of his disciples such as Walter Crane (1845–1915), W. R. Lethaby (1857–1931), John D. Sedding (1837–91), Lewis F. Day (1845–1910), and Charles R. Ashbee (1863–1942). Day, who was very much a true designer, wrote in *Everyday Art* (1882): "Whether we like it or no, machinery

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

and steam-power, and electricity for all we know, will have something to say concerning the ornament of the future."

From Van de Velde to Muthesius. The rationalist tendency that characterized American architecture from the middle of the 19th century later appeared fully in European architecture with the work of H. P. Berlage (q.v.) in Holland, Adolf Loos (q.v.) in Austria, Tony Garnier and Auguste Perret (q.v.) in France, and Peter Behrens (q.v.) in Germany. This trend was not long in affecting industrial production as well, particularly when a number of modern architects such as Behrens also turned to industrial design. In 1907 Behrens became advertising and design consultant for the Allgemeine Elektricitäts-Gesellschaft (AEG; PL. 44) and in 1909 built the AEG Turbine Factory in Berlin (V, PL. 103).

Only an apparent contrast distinguishes the rationalism of the above group from the almost contemporaneous tendencies of Art Nouveau (q.v.). In 1903 Henri Van de Velde, who with Victor Horta was one of the leading exponents of Art Nouveau, had declared himself a supporter of "logical structure in products, logic without compromise in the use of materials and a proud honesty in working methods" (*Die Renaissance im modernen Kunstgewerbe*, Berlin, 1901). Art Nouveau was strongly influenced by the English Arts and Crafts movement and Pre-Raphaelitism. In 1891, when English handicrafts first appeared on the Belgian market, Serrurier-Bovy was already beginning to produce in his Liège factory furniture based on English models, and Van de Velde was starting his design career under the influence of William Morris. Van de Velde's decoration of Siegfried Bing's Paris shop in 1896 helped spread Art Nouveau to France, where in the work of Emile Gallé and Hector Guimard it developed in a highly imaginative and decorative way. Though Art Nouveau was, in many ways, closer in theory and practice to the Arts and Crafts movement than to the rationalist currents of the early 20th century, one of its chief merits in the development of modern industrial design was its insistence upon a close connection between decoration and structure in both architecture and design.

Germany and Austria also saw advances in modern design around the turn of the century. In 1903 the Wiener Werkstätten (Vienna) were founded by Josef Hoffmann (1870–1956) and Karl Moser (1860–1936). The Werkstätten flourished until about 1913 and were primarily concerned with the creation of furniture and household objects that would be functional yet artistic. In Germany the achievements of Morris and the Arts and Crafts movement and of architects such as Charles R. Mackintosh (q.v.) and Arthur H. Mackmurdo (1851–1942) were spread largely by the German architect Hermann Muthesius (1861–1927); Muthesius had been attached to the German embassy in London from 1896 to 1903 and had studied at first hand the problems involved in the industrialization of handicrafts in England. His return to Germany presaged the advent of a new German art style known as "Maschinenstil." Muthesius's active campaigning was partly responsible for the creation in 1907 of the Deutscher Werkbund, to which numerous architects belonged — including Hans Poelzig and others who tried to put industrial production on a firmer artistic basis.

The activities of these associations helped produce important changes in the art-training centers of Germany and Austria, as did the appointment in 1899 of Hoffmann as professor of architecture at the Vienna School of Arts and Crafts, later of Behrens as director of the Düsseldorf School of Arts and Crafts, and of Van de Velde as director of the Weimar Academy.

From the Bauhaus to the present. In 1919 Walter Gropius (q.v.), a former pupil of Van de Velde, replaced the latter as director of the Weimar Academy and transformed it into the Bauhaus. Until 1925 the Bauhaus was located in Weimar; then it moved to Dessau, where it remained until 1933, when it was closed by the Nazis. During the period of its existence the school epitomized the aims of the modern movement in architecture and design. Some of the greatest artists of the age were at one time on the faculty of the Bauhaus: the painters Klee, Kandinsky, Feininger, and Moholy-Nagy (qq.v.); architects and graphic artists Mies van der Rohe, Breuer (qq.v.), Max Bill, Hannes Meyer (who succeeded Gropius in 1928 as director), Gyorgy Kepes, Josef Albers, and Johannes Itten.

It is all too easy today to criticize the teaching methods of the Bauhaus. Such criticism is not altogether unjustified, especially with regard to the handicrafts orientation of the school and its emphasis on artistry instead of science and experimentation. But without the Bauhaus there might never have developed in our time so clear an awareness of the new requirements necessary for the evolution of architecture and industrial design. Gropius' teaching departed from premises which were distinctly social as well as artistic and which sought to create for the public an art capable of attaining a maximum esthetic result with a minimum of cost; his approach was based on a full acceptance of the machine and the necessity of furnishing industry with new and functional designs. Gropius sought, perhaps somewhat unrealistically, to achieve a complete integration of the arts by joining art instruction with scientific and technical training. In industrial design the important achievements of the Bauhaus are amply attested by such creations as Mies van der Rohe's metal chairs (PL. 50); the nickel handles by Gropius; the automobile Gropius designed for Adler (PL. 45); and the well-known chairs by Breuer made of chromed-steel tubing with cloth pieces stretched over the frame for seat, back, and arms (V, PL. 456). Today these objects may seem dated (as does some of the contemporaneous furniture created by the artists of de Stijl, e.g., Gerrit Rietveld's 1917 chair; PL. 50); nevertheless, they constitute the real point of departure for a machine art completely devoid of superimposed ornamentation such as appeared at that time in the furniture and objects of Art Nouveau. In the years that followed, certain kinds of ornamentation in machine-made objects became acceptable, and it was recognized that Gropius' functionality, with its social implications, was directed not toward the masses but toward an intellectual elite. However, without the purification of form and the rationalization of technical means carried out by the Bauhaus, the dubious ornamentation that is still found on many industrial objects would have been more widespread than it is.

The principles of the Bauhaus were not lost after the school was closed by the Nazis. Many of Germany's finest architects and designers were welcomed in the United States, where they once again took up their teaching. Moholy-Nagy became director of the Chicago School of Design, which under his leadership continued the Bauhaus principles; Mies van der Rohe went to the Illinois Institute of Technology, where he taught for many years; Kepes, one of the youngest of the Bauhaus group, was appointed to the Massachusetts Institute of Technology; Gropius received a post at Harvard; and Albers joined the faculty at Yale. The arrival in America of the great Bauhaus craftsmen was not destined to transform suddenly the quality of American industrial design and bring it closer to European taste and procedures. The United States, with its highly advanced industrialization and important contributions already made to modern architecture and industrial design, was not greatly affected by the Utopian zeal of the German artists. In the years between the two world wars, America had already seen the large-scale development of styling; considerable attention had been given to the external appearance of products. Large design-consulting studios for industry already existed in the United States, and appliances, airplanes, and automobiles designed by these studios anticipated in their extensive styling and mechanical perfection the products that were to appear in Europe after World War II.

Among the more important American designers was Walter D. Teague (d. 1960). During the many years of his activity, Teague's studio produced a variety of products from motorboats and clinical apparatus to utensils and gasoline stations. Henry Dreyfuss, for many years a consultant for the Bell Telephone Company, designed an entire series of telephones for Bell (PL. 54). Dreyfuss has also designed the "Super G Constellation" (1951) for the Lockheed Aircraft Corporation and the ocean liner "Independence," as well as alarm clocks, thermostats, fire extinguishers, and tractors (I, PL. 136). One of the most noted American designers of a slightly later generation is Charles

Eames, well known for his lounge chair of bent plywood and steel tubing produced by Herman Miller, Inc. (PL. 51), and designer of lamps, playing cards, and other highly original compositions in plastic and wood (PLS. 54, 55; I, PL. 135; V, PL. 457). Eero Saarinen (d. 1961), Breuer, and Philip Johnson are important names in architecture as well as in design. Their designs include diesel locomotives (Breuer, PL. 46), wooden and plastic furniture, and furniture capable of being mass-produced. Particularly well known for the last are the firms of Miller and Knoll Associates, Inc., whose products also reach a European market (PL. 51; I, PL. 135). Other noted American designers are Peter Muller-Munk, Herbert Bayer, and J. C. Shalvoy. In the field of automobile design, except for a few distinguished examples such as the 1955 Studebaker by Raymond Loewy (a designer of many other products including motorboats and trains), the tendency, particularly since World War II, has been to make the body design increasingly more showy and complicated in response to consumer demands for the automobile as a status and power symbol (PL. 47). The American motorcar has become a typical example of the symbolizing tendency in industrial design that we have discussed. The form is not only made to express function; it is given psychological and emotional expressiveness as well.

The beginning of modern industrial design in Italy can be identified to some extent with the beginning of functional architecture in that country. Italy lacked the industrial tradition that in other countries goes back to the late 18th and early 19th centuries. It was only with the start of the rationalist battles centering around the Milan Triennale exhibitions before World War II (particularly the exhibition of 1936) that Italy became fully aware of modern functional architecture and design. Before this, Italian machine products, and even machines themselves (e.g., sewing machines, typewriters, steam engines), still showed decoration. In the 1930s the situation began to change. The Lancia "Aprilia" of 1937 and the ETR 200 electric trains of 1936 are among the few examples of their time whose forms show a certain maturity of design. At about this period several attempts at modern functional design were made with radios, such as those designed by L. Figini and G. Pollini (1935) and by the Castiglioni brothers and Caccia Dominioni (1939) for Phonola. Only since World War II, however, has a full consciousness of design problems in both a practical and theoretical sense really shown itself in Italy. In about 1946 the necessity for a rapid and economical means of transportation gave birth to the celebrated Vespa motor scooter manufactured by Piaggio and Company (PL. 46). This was followed shortly afterward by the Lambretta "Innocenti." These two modest but imaginative models (which were to revolutionize the field of two-wheeled transportation in Europe), together with a few automobiles of advanced design like the "Aurelia GT" and the "Cisitalia" by the designer Pinin Farina, served as examples for numerous other Italian industries and demonstrated the importance of esthetic quality in the sale of a product. During these same years Italian typewriters and sewing machines also underwent considerable design development. The "Lexicon" and later the "Lettera 22" typewriters designed by M. Nizzoli for Olivetti (PL. 56) are notable examples, as are the sewing machines designed by Nizzoli for Necchi (PL. 56), by M. Zanuso for Borletti, and more recently by A. Mangiarotti and B. Morassutti for Salmoiraghi. Also significant is the Italian development of packaging (PL. 61) and plastic products (PL. 60).

The first important Italian exhibition of industrial design was the Forma dell'Utile, conceived and arranged by the architects E. Peressuti and L. Belgiojoso and held at the 9th Triennale in Milan, 1951. This exhibit was followed by a more important one held at the 10th Triennale of 1954, which was also the occasion of a large international design congress in which Max Bill, Walter D. Teague, Le Corbusier, and Conrad Wachsmann, among others, took part. At the 11th Triennale the work of about thirty of the world's major designers was shown. In 1955 a highly successful exhibition of Italian industrial design arranged by M. Zanuso and G. Dorfles was also held in London, in which were shown, among other products, Frua's Motom motorcycle, Zanuso's Borletti sewing machine and "Martingala" easy chair, Nizzoli's "Lexicon" typewriter, glassware designed by F. Poli, fabrics manufactured by Jsa, and ceramics by the firm of Ginori. In 1954 the Rinascente department store in Milan began a series of competitions in industrial design (the Compasso d'Oro). Among the products which have won prizes are the "Atlantic" fishing reel manufactured by Alcedo, a series of steel skillets designed by R. Sambonet (PL. 57), a plastic pail by Menghi, a number of plastic objects designed by G. Colombini for Kartell, s.r.l. (PL. 60), an electromechanical clock designed for Solari by G. and N. Valle, J. R. Myer, and M. Provinciali (PL. 54), vases designed by Vianello, furniture by G. De Carlo, a water heater by Alberto Rosselli, and lamps made for Arteluce by G. Sarfatti. Two final indications of the progress industrial design has made in Italy in the 1950s are the creation of *Stile Industria* (1954), a specialized periodical under the direction of Rosselli, and the establishment in 1956 of the Associazione per il Disegno Industriale (ADI), a regulating body for industrial design that has helped organize several national and international exhibitions.

In the United States since World War II there has been a tendency to concentrate upon styling, with the result that genuine originality of form resulting from new esthetic points of view has been absent. Something similar has also happened in the other highly industrialized nations. Even in the extremely design-sober countries of Scandinavia, and in Japan, with its ancient decorative tradition, the influence of America has been felt in the gaudy designs and perhaps excessive overmodeling of some products.

Great Britain is one of the most conservative countries in architecture as well as design, and its early industrialization easily met the demands of the public, even with production that kept the same character over a long period. In fact, just after the war there were only a few products in England that showed exaggerated styling. Among the finer postwar examples of English design are the locomotives of Misha Black, noted also for his household furnishings; furniture by Robin Day, Neville Ward, and Ian Bradbery; the radios of A. Bednall and J. White; television sets by Robin Day and Arthur F. Thwaites; the electrical appliances of D. S. Ogle and Roy F. Perkins; and metal household objects designed by P. H. Davies and Robert Cantor. In more recent years, however, England has begun to follow the lead of countries further advanced in industrial design and seems to have been particularly attracted by the example of Italy. Two exhibitions of Italian industrial design held in London in 1955 and 1956 were unexpected successes. Between 1958 and 1960 the British automobile industry also realized that public demand was turning toward the types of automobiles produced on the Continent; as a result, Morris, Hillman and Austin invited Pinin Farina to design automobiles for them.

In Germany immediate attempts were made after the war to rectify the injustices committed against the great architects during the Nazi period and to regain lost ground as quickly as possible in architecture and design. But by the early 1960s Germany had not produced any really outstanding examples of industrial design. With its high level of industrialization it has, however, manufactured numerous objects of good design quality. Among them are the many products by Wilhelm Wagenfeld, including porcelain, glassware (PL. 58), plastic goods, flatware, and lamps (PL. 53); the products of the Max Braun Company, such as radios designed by Hans Gugelot and the air conditioner by D. Laing; the flatware of Hugo Pott; Max Bill's clock designed for Junghans; P. Sieber's pocket flashlight; Theo Häussler's transistor radio; and H. Ehring's fruit squeezer. Germany's most notable postwar contribution to industrial design is in the field of teaching, with the creation in 1954 of the Hochschule für Gestaltung founded in Ulm by Inge Scholl-Aicher with the aid of American funds. Max Bill, a Swiss, was asked to be the school's first director. Well known as an architect, sculptor, graphic artist, and art theorist, Bill had been one of the youngest members of the Bauhaus. His intention was to bring to the new German school the old functionalist spirit that had infused the Bauhaus. Unfortunately, Bill's approach led to disagreement with the rest of the faculty (including the painter Friedl Vordemberge-Gildewart, graphic artist O. Aicher, Hans

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

Gugelot, and critic and sociologist Tomas Maldonado), and he was forced to resign. Bill was succeeded by Maldonado, who sought to orient the instruction along critical and theoretical lines instead of stressing formal training as his predecessor had done. Maldonado was in turn succeeded by Gert Kalow.

France has made almost no important postwar contribution to industrial design, in spite of its high level of industrialization and strong theoretical interest in design problems. (Etienne Souriau, the most important contemporary French esthetician, has continued his father Paul's concern with industrial design, as have P. Francastel, M. Dufrenne, R. Huyghe, and others.) Exceptions to France's generally static level of industrial-design development are a few automobiles, notably the Citroën DS 19. However, through the efforts of the Esthétique Industrielle, the association founded and directed by Jacques Viénot until his death in 1959, France has held a number of competitions in industrial design and has introduced many excellent postwar products, such as Le Creuset's pots, the transformers and other metal objects of G. Gautier and R. de la Godelinais, B. Lacroix's lamps, T. Meunier's electric heaters, plumbing fixtures, and furniture by J. Abraham and H. de Looze, and Viénot's electric razor. Other important French designers are C. Defrance, A. Philippon, J. A. Motte, C. Gaillard, M. Mortier, P. Paulin, J. C. Hennin, and G. Pelletier.

The quality and reputation of Scandinavian design are well known everywhere; Swedish, Danish, and Finnish furniture and household objects are regarded throughout the world as almost unreachable ideals in design. The materials generally used are wood, ceramics, and glass, less frequently plastic and metal. Objects produced are usually the type for which the handicraft tradition still has validity. Many products retain a certain indication of "pleasure" in materials that recalls handicrafts, even when the items are conceived as series and produced by the most rigorously standardized means. Among the best-known Scandinavian designers are Arne Jacobsen (V, PL. 456) and Finn Juhl (both Denmark), who have created some extremely original furniture; Tapio Wirkkala (Finland), designer of many highly refined knives, forks, and spoons; Alvar Aalto (q.v.), Finland's finest architect and one of the most imaginative designers of furniture (PL. 50) and objects in bent plywood and plastics; Erik Herlöw and Tormod Olesen (both Finland), creators of Series R cast-iron enameled pots, among the best examples of contemporary utilitarian objects; and Kaj Franck (Finland), creator of many porcelain and glass objects for the home (VII, PL. 316). Among the Swedes, who also work with more distinctly mechanical objects such as calculators and heating apparatus, are Sigvard Bernadotte, Acton Bjørn (PLS. 54, 57), and Per Heribertson. Designing glassware and ceramics are Timo Sarpaneva and Toini Muona (both Finland), Herbert Krenchel and Kristian Vedel (both Denmark), and Sven Palmquist (Sweden; PL. 58; VII, PL. 325). Steel products of Folke Arnström (VII, PL. 325), Sven-Arne Gillgren, and Sigurd Persson (all Sweden) are also noteworthy. Important designers from Norway are Grete Prytz Korsmo, Willy Johansson, and Björn Engö (objects and furniture); Tore Hjertholm and Karl Korseth (furniture); and Birger Dahl (lamps).

A number of well-designed products have been made in Japan during the postwar years. The frequent accusation that Japan has not developed its own modern industrial design but has slavishly copied forms from the United States and Europe is not borne out. Japan's products compete economically with those of the West but have nevertheless maintained a distinct individuality of style, not only in the more traditional areas of housing and furniture but also in household objects and electrical appliances. While Japanese-produced electrical equipment and precision instruments do not yet show any striking originality of design compared with those of the West, Japanese products that were once handicrafts but are now fully industrialized show unmistakable national characteristics. Among the products noteworthy for distinction and precision of design and for excellence of execution are the furniture of Sori Yanagi (one of the best present-day Japanese designers; V, PL. 456), Isamu Noguchi (the well-known sculptor), and Kenzo Tange (perhaps Japan's best contemporary artist); the lamps of Yoshida, Saito, and Tsutoma Shimozuma; the furnishings of Iwao Yamawaki, Riki Watanabe, and Kenmochi; and the glassware of Masakichi Awashima.

Teaching of industrial design. As with many of the newer disciplines of our time, the question of industrial-design instruction arose when the field had already reached a certain level of maturity. The earliest instruction was given by handicraft schools, which, firmly established within the craft tradition, often incorporated industrial design within their curriculums, frequently in an incomplete form or incorrectly. In England, where at the beginning of the 19th century there was already an awareness of the importance that machine products were to assume, schools were early established in connection with semihandicraft factories; they included instruction in what we would today call industrial design.

A similar development occurred in Germany. The Bauhaus, as discussed above, was first directed by Van de Velde, who worked fundamentally within a handicraft tradition, although he was acquainted with the developments of industrial art. It was under Gropius that the institution became a school of industrial design in the full sense of the term. The Bauhaus, along with other schools, not only trained students in the craftsmanlike handling of different materials but also gave specific instruction in designing for industry. Its teaching methods (for a more complete treatment see Argan, 1951) are, as we have seen, generally considered outdated today, mostly because they were pervaded by a prophetic and socially Utopian functionalist attitude that no longer corresponds to present-day conditions of life and work.

In Italy, notwithstanding the recent vigorous development of industrial design, no school yet exists devoted exclusively to training in this field. One exception is the sincere but modest attempts of the industrial arts school founded by Nino di Salvatore in Novara, which offers an introductory course in design. The department of architecture of the University of Florence offers a course in designing for industry, ably taught first by the architect Leonardo Ricci and later by Pierluigi Spadolini. But because of technical and material limitations, the course (as of 1962) has been rather a supplement to the architecture studies than a specific training in the theory and practice of design. In 1960, organization was also begun in the University of Venice for a department of industrial design.

Most American and European design institutes already in operation can be distinguished according to their scope, depending on whether they aim at developing designers who are at the same time graphic artists and architects or are specialized within a given area, or, on the other hand, aim at a complete integration of industrial design within the field of visual and literary communication, as is the case with the Hochschule in Ulm. Furthermore, some schools are primarily craft schools (most of those in Germany and Scandinavia) in which limited design courses are given in a particular area such as ceramics or woodwork.

In the United States, the five-year program of the University of Syracuse affords a fairly typical example of college-level industrial-design training. The program comprises, in addition to the required academic courses, design analysis of structural and form elements in natural and man-made objects; introduction to the use of basic tools and machines; development of manual dexterity and manual and visual sensitivity; development of expressiveness, using various means of design and presentation; market analysis, packaging, and display; development of a product design from its initial stages through the model stage to the final, definitive example; study of the physical properties of materials and the theoretical and practical aspects of their structures; mechanics and the mechanical transmission of power; the study of products for domestic, commercial, and industrial use through the determination of human needs, limitations of materials, and sales distribution; time and cost analysis; full-scale construction of working models; problems in advanced designing and commercial and industrial planning; professional practice: professional ethics and responsibilities of the designer and relations with clients; office organization and management;

contracts, letter writing, accounting, and billing; protection of designs: patents, copyrights, and trademarks; and professional organizations.

INDUS VALLEY ART. Like the contemporaneous Mesopotamiam and Egyptian civilizations, the first Indian civilization flourished, in its major centers, along the course of a great river. It has also been called both the "civilization of Mohenjo-daro" (for the locality in which the first of its great cities was discovered) and the "civilization of Harappa" (for the city whose cultural development during the 3d and 2d millenniums B.C. seemed easiest to trace). It is certain, however, that the area within which the civilization expanded extends, both to the east and to the west, far beyond the geographic limits of the basin of the Indus (see ASIATIC PROTOHISTORY). The Harappa civilization is noteworthy for the plan of its towns based on an invariable and regular design that may be described, in modern terminology, as functional because it was intended to meet the practical needs of the inhabitants. In the plastic arts are found creations of great artistic value, notwithstanding their small dimensions; the freedom of their shapes seems far removed from the rigid patterns of primitive esthetics. In this tendency to symbolize reality in an illusory yet stylized manner, as shown in the recurrent use of animal figures, the Indus Valley civilization seems to foreshadow certain characteristics of Indian art (q.v.).

SUMMARY. The early background (col. 106). The civilization of the Indus Valley (col. 106). Chronology and expansion of the Harappa culture (col. 108). Social and technological background (col. 109). Arts and crafts of the Harappa culture (col. 111): *Stonework; Metalwork; Ceramics; Jewelry*. The Aryan invasions (col. 116). The end of the Harappa culture and its influence on the invaders (col. 117). Survivals of the Harappa culture (col. 119).

THE EARLY BACKGROUND. The earliest known inhabitants of the Indus Valley left evidence of their presence in the workshop sites at Rohri and Sukkur, places near the vast irrigation dam and railway bridge that now span the river. Here they made their early core and flake tools; from here the Harappans were to derive the cherty flint for their flake-blade knives. A number of microlithic sites, in the main associated with the hilly country bordering the lower Indus, also show the presence of mesolithic hunting and food-gathering peoples. Without doubt their settlements persisted side by side with the Harappa culture; one such community, whose tools were found on the banks of the Lyari River near Karachi, used Rohri chert and left typical Harappan flake blades and cores in addition to their traditional microliths of geometric style. This find produces the sole roughly datable instance of an early microlithic industry (ca. 2400–2000 B.C.).

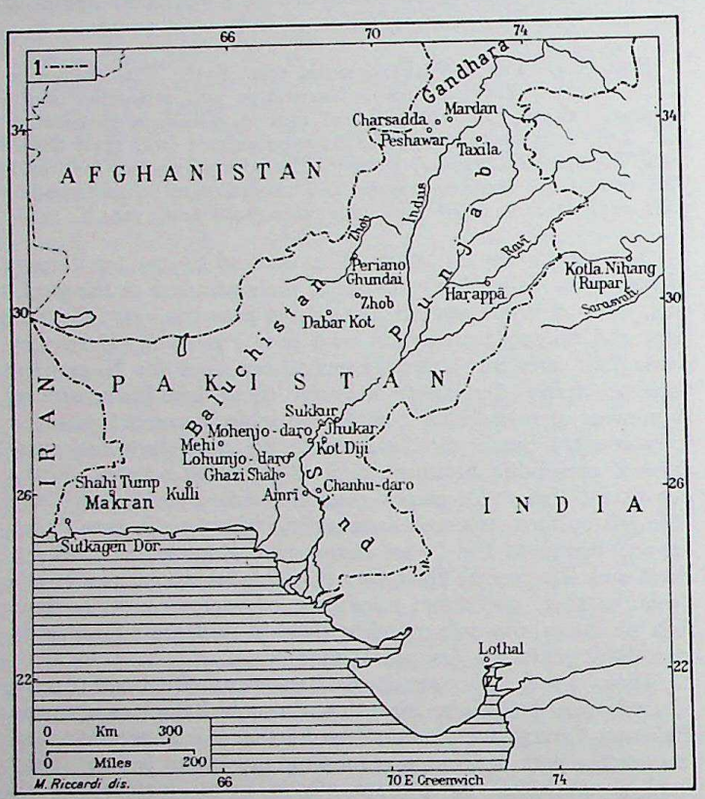
About 2700 B.C. peasant farmers from the high plateau of Iran, who had been spreading through Baluchistan, made their way through the passes of the Kirthar Range and occupied the greater part of Sind surrounding the lower Indus. They were accompanied by potters whose work, manifesting an attractive diversity of painted decoration, has been called "Amri ware" after the site of that name (see CERAMICS). Though they possessed a small number of copper articles acquired by trade, these farmers were in a neolithic stage of cultural development. There is no indication that they could or did develop the urban civilization that displaced them, without the intervention of some considerable external stimulus. Amri pottery, while varying from place to place in its styles of decoration, is a clearly related cultural product, which is sometimes influenced by similar decorative styles employed in Baluchistan. Harappan pottery, at first existing side by side with Amri ware and finally succeeding it, manifests a new and quite unrelated tradition; there is no question whatsoever of the merging of one into the other by slow cultural development. Thus the Harappa culture came as an intruder into a congeries of peasant farming communities, bringing elements of civilization wholly unfamiliar to those who had inhabited the Indus Valley before its arrival; as a token of their artistic ability these early inhabitants left behind only painted pottery with a considerable measure of primitive charm.

THE CIVILIZATION OF THE INDUS VALLEY. The basic elements of that remarkable civilization, the Harappa culture, were introduced into the Indus Valley at a date which cannot be much earlier than 2600 B.C.; it is not now, and may never be, possible to know with complete certainty the manner in which these wholly different conceptions of life were brought to India. One thing is quite clear: there is not the slightest evidence for any slow and laborious evolution in India itself. This culture was urban from its start. Apparently it began with the founding of a modest town at Mohenjo-daro (PLS. 63, 64), then on the west bank of the Indus, now at some distance from

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

the river, which has many times shifted its course; the town grew into a remarkable city of considerable size. It has been contended that the Harappa culture arrived fully developed from the very start, but this is not so. It is likely that certain peoples from the lands at the head of the Persian Gulf determined to band together in order to establish a colony in new lands overseas. The first landfall which would offer a country worth settling would be the mouth of the river Indus if they came by sea, coasting along the northern shore of the Persian Gulf, as is most likely; the elements distinctive of the Harappa culture from its beginning in India would never have



Chief archaeological sites of the Indus Valley civilization. *Key*: (1) Modern national boundaries.

survived a long overland trek in bullock carts. These peoples brought knowledge and ideas and had before them the stimulus of a new land. They were clearly accustomed to the use of sun-dried bricks; much of the building in the Indus cities — platforms, ramparts, in fact anything which required a solid infilling — was carried out in sun-dried brick. However, they also knew of fired brick. It is likely that in the country of their origin timber was too scarce to fire large quantities of bricks; in the Indus Valley, however, trees must have been plentiful, and, no doubt faced with heavy rainfall, the founders of the Harappa culture used available wood to produce the vast quantities of baked bricks which are so outstanding a feature of their towns and cities.

The recently excavated site of Kot Diji, near Khairpur in Sind, has brought to light an interesting settlement. This does not reveal, as has sometimes been thought, the Harappa culture in evolution; as suggested in the preliminary excavation report, the settlement was almost certainly in contact with the Harappan cities, from which it borrowed elements of pot decoration. As might be expected, the shards from the Kot Diji site so far published show resemblances to Amri ware from Ghazi Shah and to the earlier Harappan types of Chanhu-daro. Though present knowledge of this site is slight, the fact that it was burned, apparently by the Harappans, who then settled there, suggests certain tentative conclusions. The settlement was originally (ca. 2700 B.C.) one of Amrian peasant farmers. In pioneering communities such as Mohenjo-daro in its earlier days there are always dissident and independent types who are expelled or who move on to new ground. Such may have settled at Kot Diji about 2500 B.C. and built a small fortified town, which preyed on Harappan communications and was in consequence attacked and burned (ca. 2250). As no doubt the surrounding area was under cultivation, the place was settled by the Harappans to occupy this point on the route between Harappa and Mohenjo-daro and was maintained probably until the 16th century B.C.

The Harappans must have been a mercantile people capable of considerable feats of organization; the felling of timber, the making and firing of bricks, and the erection of well-constructed houses by builders and carpenters all required great skill and competent direction. If the life span of Mohenjo-daro, the earliest and longest lived of the Indus cities, is somewhat arbitrarily divided into four periods marking its rise, greatness, stagnation, and decline, certain events can be assigned roughly to their position in those periods and the appearance of innovations and improvements can be charted.

In judging the artistic output of the Harappans, that of their contemporaries must be borne in mind. If the period of greatness is placed from 2350 to 2200 B.C., it would coincide with the dynasty of Akkad in Iraq; however, as all the pieces of statuary were found in late levels, 2–6½ ft. below the surface, they might well be much later, coinciding with the 1st dynasty of Babylon. But no clear parallels can be drawn with Babylonian art objects. The general impression gained of the Harappans is that of a mercantile people of considerable administrative ability, whose ruler — whether a single individual or a corporate body — was not a patron of the fine arts.

CHRONOLOGY AND EXPANSION OF THE HARAPPA CULTURE. The dating of the Harappa culture depends wholly on the discovery of various objects of Indus Valley origin and those having unmistakable Harappan traits in datable surroundings elsewhere. About a dozen seals, either from the Indus Valley or with clear Harappan affinities, have been found at Ur, Kish, Tell Asmar, Tepe Gawra, Lagash, and in Syria at Hama; they cover a period from about 2400 to 1750 B.C., the majority being of Sargonid date. Kidney-shaped bone inlays found at Tell Asmar and copies of conch-shell sections of similar shape found at Indus sites are all of Akkadian date, as are carnelian beads etched with a figure-eight pattern and gold disk beads with an axial tube. Similar gold beads appear at Tepe Hissar III together with the notched paste beads so common in Mesopotamia (q.v.). At Shah Tepe, not far from Tepe Hissar, notched paste beads reappear, accompanied by a square carnelian bead etched with a singular design of circles in radiating compartments. This uncommon type of etched bead also appears in the Royal Tombs of Ur. The fact that both it and the notched paste beads have been unearthed at Mohenjo-daro bears out the dating of 2400–1750 B.C. for the trade contacts already suggested by the seal data.

The earliest contact is represented by a fragment of steatite found at Mohenjo-daro which has carved decoration in imitation of woven reed matting. This is a portion of a Sumerian hut-pot, carved to portray the reed huts of early Mesopotamia with their walls of reed matting and their reed-bundle doorways; such small jars were common throughout Iraq from Susa westward to Mari in immediately pre-Akkadian times and are found in the Royal Tombs of Ur. A date of about 2450 B.C. would fit in well with the Period I level in which the fragment was found.

All the evidence now available, which will be canvassed more fully in a later section, indicates that the Harappa culture was brought to an end by a series of invasions from the Iranian plateau (ca. 1800–1400 B.C.). Late incised-stone vessels, possibly third-hand copies of the early naturalistic Sumerian hut-pots, are found in the upper levels of Mohenjo-daro; these may be imports from Kulli or Mehi in Baluch Makran. A date not earlier than 2100 B.C. would be appropriate for these late copies wherever found. Even allowing for the yet untouched depths at Mohenjo-daro, it is extremely doubtful whether the date of the founding of the Harappan city, as opposed to any earlier occupation, can be much, if at all, earlier than 2600 B.C.,

while it seems probable that this was the last among the Indus Valley cities to survive, being finally destroyed about 1550 B.C.

As their city grew in strength, the Harappans enlarged their hold upon the surrounding countryside. Small Harappan townships appear at Jhukar, Chanhu-daro, and Lohumjo-daro along that stretch of the Indus over which the Harappans held sway.

It is suggested that Period I (ca. 2600–2400 B.C.) was the formative period of the Harappa culture. All the various arts and crafts which gave it the right to be classified as a fully civilized community, producing such important public works as the Great Bath (PL. 64) and the Granary in the citadel area at Mohenjo-daro, achieved their highest degree of quality and perfection in Period II (ca. 2400–2150). Those who had instituted citadel rule during this period planted a colony at Harappa on the river Ravi, a tributary of the Indus, 350 miles to the north in the Punjab. About 2300 these colonists, no doubt led by members of the Harappan ruling class or dynasty, dispossessed peasant farmers connected to the Zhob people of Periano Ghundai II (see CERAMICS) and founded a city with a citadel and a granary on the same pattern as their parent city.

During the succeeding centuries (to ca. 2000 B.C.) Harappan settlements extended along the ancient river Sarasvati as far east as Rupar and Kotla Nihang in eastern Punjab. A settlement has been found as far south as Lothal in Gujarat. Trading posts in the Zhob at Dabar Kot and at Sutkagen-dor in Baluch Makran suggest contacts with the peasant farmers of the hill valleys of northern Baluchistan, while a Persian Gulf entrepôt facilitated trade with Sumer and Akkad.

Although some outward expansion may have taken place during Period III (ca. 2150–1800 B.C.), this was in general an era of stagnation marked by few, if any, improvements or innovations. It is possible that at this time the invasion of Mesopotamia by Guti barbarians may have brought outside contacts with that country to an end. Western contacts may have been reopened with the 1st dynasty of Babylon during the marked decline after 1800, in Period IV, at the same time that the pressure of invading forces drove a wedge into the region (ca. 1700). Those invaders, whose forays had penetrated during the previous century farther and farther into the Indo-Iranian borderlands, continued their attacks after that first impact until they eventually occupied the townships of Jhukar, Chanhu-daro, and Lohumjo-daro; only the city of Mohenjo-daro, because of its superior strength, was able to resist these attacks.

While no evidence shows that the Harappans dislodged by the invading Aryans ever retreated to make a fresh start in the Ganges-Jamuna Valley and to reproduce their culture, small provincial settlements, probably of a late period, have been uncovered on the western coast at Saurashtra (mod. Soruth) and near the mouth of the Narbada. Other settlements have been brought to light at Alamgirpur, about 16 miles west of Miraht (mod. Meerut), the only Harappan settlement east of the Jamuna known to this time. Though the settlements of Rupar in the Punjab and Lothal in Gujarat may have survived for several decades longer, the nucleus of the Harappan realm had ceased to exist by 1500 B.C.

SOCIAL AND TECHNOLOGICAL BACKGROUND. It has already been mentioned that an outstanding feature of the Indus towns and cities was the extensive use of baked brick (PLS. 63–65). There was a high standard of town planning; blocks of houses were divided by straight main thoroughfares and connecting side streets, while drainage works to draw off household waste water, sewage, and storm water indicate an appreciation of the value of controlled sanitation. The earliest drains (PL. 63) appear toward the end of Period I.

To support this urban civilization, with its civic functionaries, its leading families (who provided direction for affairs of state), its artisans and tradesmen, there had to be a prosperous economy which yielded a surplus sufficient to maintain social services and to purchase consumer goods. The vast granaries at Harappa and Mohenjo-daro bear witness that this economy was quite clearly based on a considerable grain production; some of the grain, as well as cotton, was almost certainly exported. Traces of a cotton material of plain weave — used to wrap certain copper articles — were providentially preserved by the action of metallic salts produced by the combination of the copper with alkalis in the damp soil.

Such an economy would presuppose the use of transport. Model cart frames and wheels in terra cotta and the marks of wheel ruts in the earth testify that the Harappan cart was of the same type as those found today in Sind; its wheel span was identical with that of its modern counterpart, and it differed only in having solid rather than spoked wheels. Overseas trade entails the use of small ships; evidence for the existence of river transport and coastal shipping is provided by one of the characteristic seals of this culture, which depicts a boat with a high central deckhouse or cabin.

At Harappa there are slave barracks on the north side of the citadel area, adjacent to the granary and to the grain-pounding platforms where the slaves turned out quantities of coarse flour. Certain small terra-cotta figurines of seated men, squatting with knees drawn up, some of them wearing a broad flanged collar, may be ex-voto offerings of slaves in lieu of an actual human sacrifice.

It seems likely that the community was ruled by an oligarchy and that its upper class was mercantile rather than priestly or warrior. Its mercantile system did not function in all its details from the start; weights and seals, which must have formed a very important part of trading practice, were found in such small quantities in those levels which may pertain to Period I that it is doubtful whether seals were introduced much before the earlier part of Period II, and weights much before the later part. The system of weights was unique. The weights themselves are cut and polished cubes of chert. The lower weights progress by doubling from 1 to 64, which is two-fifths of the next unit of the system, 160. From this point there is a new progression in decimal multiples of 16.

As will be shown in subsequent sections, the Harappans had a competent standard of metallurgy and a script which has survived only in brief inscriptions on seals, jars, and copper tablets and axes, but which must have been used for trade records and accounts as well, if for no other purpose. No public inscriptions, neither edicts nor dedications, have emerged if they ever existed. It is the lack of any classifiable document which makes the decipherment of this Indus script practically an impossibility.

Intercourse with the Sumero-Akkadian realm brought knowledge of the properties of bitumen in rendering a structure watertight. This knowledge was employed to advantage when building the Great Bath at Mohenjo-daro (PL. 64). A layer of asphalt 1 in. thick was introduced into the side walls and floor of the tank. Although the idea came from Iraq, the mastic employed at Mohenjo-daro was of an entirely different type from that used at Tell Asmar or Ur; obtained locally from sources on the Sind-Baluch border or in the Punjab, the Indian product is a refined rock asphalt with sufficient mineral content to permit application by troweling without the addition of any stiffening material.

The Great Bath is one of the few structures for which a religious purpose has been suggested. Ritual cleansing by bathing before participation in religious ceremonies is a well-attested custom. There is also the supposition, which may well be correct, that the Buddhist stupa which dominates the citadel was built immediately above the site of a temple; for this reason an imposing building between the stupa and the Great Bath was named by the excavators the "College of Priests." It is of course possible that the stupa does overlie a temple, but none of the buildings so far excavated in its vicinity, not even the "College of Priests," gives evidence of any other than a secular use. The truth is that knowledge of the Harappan religion is very slight. There are no temples, of which the architectural layout could afford some clue, nor are there texts, like the Babylonian Gilgamesh epic, to disclose religious concepts, nor even temple accounts which might reveal the practical administrative picture. Names of gods may be concealed in the seal inscriptions, but they cannot be

UP State Museum, Lucknow

read. The best keys to the religious ideas and practices of the Harappans are the seals themselves. Some depict people in an attitude of worship. To what or to whom do they pay this tribute? Two worshipers, each backed by a snake of considerable size, kneel to the seated figure of the god, who is recognized as the horned god by comparison with a well-known seal in which he is shown surrounded by animals. This figure is sometimes depicted standing between branches of pipal (*Ficus religiosa*) and attended by a kneeling worshiper accompanied by a large spiral-horned goat, and in some instances by a row of priestesses. A kneeling figure also makes an offering to what must be a sacred tree. There was therefore a horned god, associated with a sacred pipal tree, which appears on seals and sealings; the pipal tree is also connected with bull leaping and with a sacred enclosure containing a pillar crowned with the horns and hair braid of the horned god. The quantity of female figurines suggests a mother goddess, though none of them has the sex exaggerations common to fertility goddesses. Figurines of oxen are related to the seals showing bull or buffalo baiting and sacrifice. In summary, the cult seems to be directed to a horned god and fertility goddess, accompanied by the sacred tree or grove and by the ritual baiting and sacrifice of cattle; the pattern is a familiar one.

ARTS AND CRAFTS OF THE HARAPPA CULTURE. *Stonework.* In the first place it should be borne in mind that at Mohenjo-daro no indigenous stone exists. Every pebble found at the site, alabaster, limestone, steatite, or sandstone, had to be imported, the nearest sources being Sukkur on the Indus and the Kirthar Range. In all, some seventeen or eighteen sculptured pieces of stone of all sizes (seals are not included) have been found at Harappa and Mohenjo-daro, particularly at the latter site (PLS. 66–68). The greater number seem to portray a seated or squatting male figure, possibly a god. These figures are of no great size; if the largest head found belonged originally to such a figure, the whole would have been roughly 2 ft. high, an average size being about 16 in. By far the best-preserved piece shows the head and shoulders of a bearded man. His hair is bound with a fillet having a circular ornament on the forehead (PL. 67). When examined in London in 1947, this figure was found to be of sandstone with a fired surface coating. In its general appearance there is nothing remotely resembling Sumerian or Babylonian types or artistic style; by far the closest parallels are to be found in the subject Asians, Sangari and Kadshi, portrayed on the chariot of Pharaoh Thutmosis IV.

The remaining male figures from Mohenjo-daro do not enhance the artistic reputation of the Harappan sculptors. The figures are ill-proportioned, the body and arms appearing small in comparison to the head and legs. Most of the details, notably the ears and hair, are schematic. Although no proper record was made by excavators, all these figures were found in late levels; none can be placed earlier than the latter half of Period III (ca. 1900 B.C.). In addition to these human figures, there are two limestone figurines of rams.

Two fragments of carved steatite, one showing only the hair portion of a woman's head and the other a small female image, were found at high, almost superficial levels. These are almost certainly of the early historic period and date to the time of the Buddhist occupation.

Since only two stone sculptures were found at Harappa, a considerable measure of uncertainty has always existed as to whether these two limestone statuettes can with confidence be assigned to the time of the Harappa culture. The first is a naked male torso with a somewhat protruding stomach, in which the body planes are rendered with much skill and sensitivity (II, PL. 8); the other is a male dancing figure which shows a mastery of balanced movement but has nothing of the anatomical perfection of the former. At first sight it would appear that there is no basis for an attribution to the Harappa culture. But no known stone images of the early historic period have separately carved detachable heads, as did the male torso. There are indications that the nipples of both figures were inlaid; circular depressions on the shoulders of the torso might also have been intended for inlays, though these would make little sense. Inlays are a feature of the Harappa culture, and the sensitive rendering of some of the animals depicted on the seals indicates a possibility of an equal sensitivity in carvings in the round. There are, however, equally cogent arguments against such an attribution. Apart from the detachable head and the question of inlays, the male torso is a typical northern Indian carving of the early centuries of the Christian Era. Though they are the only sculptures found at Harappa, the torso and the dancer show not the slightest resemblance in subject, style, or artistic sensibility to any of those found at Mohenjo-daro. It would seem better to suspend judgment as to the provenance of these two sculptures until there is further evidence of Harappan origin, and to refrain from using them to support any particular argument concerning Indian art history, since numerous remains of the Buddhist period were also found at Harappa.

Possibly the most characteristic feature of the Harappa culture is a series of small stone tablets, averaging roughly 3 cm. square and 8 cm. thick, cut from steatite, and coated with an alkaline substance before firing. Perhaps these were used as seals; on the obverse is engraved a line of characters of the Harappan script and a picture, while on the reverse appears a narrow raised boss with a single incised line and a hole for a cord. The picture is almost always of an animal. The most common theme has been identified as the urus ox, depicted in profile with only one forward-pointing horn visible; the tiger, elephant, humped bull, buffalo, rhinoceros, and mountain goat are also represented (PL. 69). Religious or mythological subjects are not common, but there are a few late seals portraying a hero subduing tigers or a seated horned deity.

E. J. H. Mackay was of the opinion that the line of script constituted the seal element and that the picture was amuletic. There is no real evidence to support this idea. If the animals are regarded as totemic, conferring amuletic benefits, the disproportionate number of urus ox figures renders absurd such a supposition. Beyond the fact that these objects were used to seal and mark bales packed in matting, nothing is known about them. The very few sealings that remain survived mainly through accidental baking. Baked seal impressions, probably used as tokens, can be paralleled in early historic times. That any of these seals or sealings were regarded as luck-bringing or protective is doubtful, though any interpretation must of necessity be wholly speculative.

The actual execution of the seals is very uneven. As is only natural, only the finest examples are commonly used as illustrations, in particular the depiction of a humped and heavily dewlapped Brahmany bull, a magnificent specimen of the seal cutter's art. The high degree of anatomical skill displayed in a few outstanding seals has been put forward in argument to support an early date for the two Harappa statuettes carved with equal mastery. As the finest seals come from Mohenjo-daro, which has produced no statuary remotely resembling the competence of these statuettes, it is doubtful that this argument carries much weight.

Though humans or gods in human form are uncommon in the seal pictures, these subjects appear on what are possibly the most important and most interesting seals. One religious scene shows a goat with a human face standing behind a kneeling figure who worships a deity framed by pipal branches. Other seals show men tossed by a buffalo, a man spearing a buffalo, and a man leaping a bull in front of a sacred tree in an enclosure with a pillar bearing the horns of consecration of the horned god; this last is a most Minoan scene in all its details.

Metalwork. In spite of the surviving fragments of a few sickle blades, it is doubtful that metal was used extensively for agricultural tools; however thus restricted in scope, the metalwork of the Harappans in copper and bronze shows a knowledge of all the techniques in use during the 3d millennium B.C. Some of the small figures of humans and animals in bronze are the finest artistic works produced by this civilization. It is impossible to ascertain precisely how these figures were made; it is clear that they were molded, and probably a number of them were produced by the lost-wax process.

Two outstanding metal figures of women, possibly representing dancers, were found at Mohenjo-daro; the better preserved of the two has a remarkable quality of vitality (II, PL. 7). These ladies have been used as supporting evidence for assigning a 3d-millennium date to the Harappa statuettes. There is also a bronze image of the horned god, a squat dumpy figure with short, thick legs and with arms pressed close to his sides. The copper or bronze animals are for the most part striking representations of their particular kind.

Animal figures also served as ornamentation, although it is difficult to tell in what manner they were used. Two objects, without question derived from the same mold, depict what may be a bull standing on a bar, with a ring cast centrally onto its underside. The suggestion that these objects were rein rings receives little support from the fact that the space over the bar between the animal's legs, through which the rein would have to pass, is only $^{5}/_{8}$ in. wide. A bronze figure of a crouching goat tied to a post by a band of cloth is furnished with a tang, and so was fixed to something, possibly a stand. Mackay was of the opinion that the depiction might have formed part of a group with the goat as a sacrificial victim.

Three small two-wheeled carts cast in bronze have come to light, one at Harappa and two at Chanhu-daro. One from each site has a gabled canopy and is of much the same type as a modern ekka; drivers are seated in two of them. Presumably these toys would have been completed originally by bronze oxen to draw them, just as some of the terra-cotta oxen found in such great numbers must have been toys to draw the model carts, the terra-cotta frames of which can be picked up in equal abundance. (Cf. X, PL. 100.)

An animal-headed pin from Mohenjo-daro and a rod from Harappa are metal objects of considerable dating value. Though they may well have been copied by Harappan craftsmen, they were in fact more generally at home in the area of Asia Minor, the Caucasus, and the Caspian. Two antelope heads, back to back, spring from the bulbous head of the bronze pin from Mohenjo-daro. On the crossbar of the rod from Harappa stands a horned animal, probably a mountain goat, attacked by a dog. The pin, which was found at a depth that might indicate its context as the beginning of Period III (ca. 2150 B.C.), might well prove to be of later date, but the rod, unearthed from only about 2 ft. below the surface, is likely to be late in date, conceivably even post-Harappan. Though there are a number of early examples from Mesopotamia, the clearly related ones scattered from Mycenae to Tepe Hissar are dated about 2000 B.C.

Thin small tablets of copper, bearing on one side a design, usually an animal, and on the other a line of script, have been found at Mohenjo-daro. Their appearance is striking; the engraved outlines have filled with cuprous oxide and show up as a contrasting red against the copper background. While the designs are similar to those cut on the stone seals, there are some new forms. The exact purpose of these tablets is unknown. It has been suggested that they are amulets, but since they have no loop or hole for suspension, they must have been concealed in an amulet case, which seems unlikely. Their use as coins has been rejected because they vary in weight and conform to no standard. However, they may have been tokens denoting a payment obligation; this possibility is strengthened by the small seals from Harappa, very many of which have identical inscriptions on one face and on the other what appears to be a numeral, a fact again suggesting tokens. Moreover, this idea is supported by a much more recent example. At early historic period sites between Peshawar and Mardan, in the North-West Frontier Province of Pakistan, numbers of baked clay sealings impressed with intaglio seals of the Parthian and Kushan periods (50 B.C.–A.D. 300) have come to light. These are ovate or wedge-shaped lumps of clay, quite useless as anything but tokens. It is suggested that all these classes of objects served the same function, that of commercial tokens.

Though the majority of the less well-to-do citizens of the Indus townships must have contented themselves with pottery vessels and with the chert-blade knives which are recovered in such abundance as to justify the classification of this civilization as chalcolithic, the more wealthy had copper and bronze household utensils in addition to these more expendable items. From the earliest times the Harappan coppersmiths must have known the art of producing simple pots, pans, and bowls. The deeper and more globular bowls were formed by a technique known as "raising": a flat disk of copper or bronze is continuously hammered on its outer side while the inner side is turned slowly around the surface of the metalworker's stake, and thus the metal is raised in a series of concentric rings. The simple shallow pans and bowls show hammer marks on the inside; these were made by the easier method of hollowing, or sinking, in which the metal is sunk to the required depth and shape by being hammered and turned over a circular depression in a block of wood.

Other more advanced techniques were used as well. A small pedestal jar, found at a level which indicates the middle of Period II (ca. 2300 B.C.), was without doubt cast by the lost-wax method. The process of lapping, joining sections of sheet metal, seems to have been employed only during Period IV (after 1800). This technique was used to affix the base to an elliptical jar, to form a copy in metal of what was without doubt the most elegant ceramic form produced by the Harappan potters. The same technique was used to join the upper and lower portions of sharply carinated bowls, each portion being fashioned separately by raising, then joined by lapping at the carinated shoulder.

Certain objects found in the lower levels undoubtedly date from the earliest times, from the first foundation of the Harappan settlement. The manufacture and use of metal flat axes, chisels, saws, knives, arrow- and spearheads, and fishhooks are implicit in the very nature of the Harappan culture as observable from the start; the building achievements and general way of life presuppose the use of such weapons of the chase and tools. Certain articles connected with human adornment, such as razors, pins, bracelets, and handled mirrors, also make their appearance quite early. The methods by which these articles were turned out are comparatively simple. Flat axes and mirrors were cast in open molds, chisels were hammered out from round or square-sectioned rods, while razors, knives, and heads of arrows and spears, of thin section, were chiseled from sheet metal. In each case the tool or weapon could have been shaped and hardened by annealing and cold hammering. It seems inconceivable that the Harappans did not know of the western Asiatic shaft-hole ax, widespread after 2500 B.C., though, as will be seen, even when this type was introduced in India by invaders, the use of the flat ax continued throughout the subcontinent up to the onset of the Christian Era.

Ceramics. Though images of stone are scarce at Harappan sites, there is no lack of terra-cotta figurines, both of humans and of animals; at Mohenjo-daro more than 500 human and 800 animal figures were unearthed (PL. 70; II, PL. 7), while Harappa produced nearly 700 human and only about 300 animal figures of this sort. By far the greatest number of the human figures are women, probably images of the mother goddess. When intact, all these mother-goddess figurines have a narrow loincloth and are adorned with one or, very rarely, several necklaces and, occasionally, with a girdle; most have also a high comblike headdress, with braids of hair arranged in various styles. At Harappa only one figure has as many as three necklaces, and at Mohenjo-daro only five have three or more; the most common by far are those having only a single ornamented collar round the throat. In a few instances the headdress includes two cuplike objects secured by bands, one on each side of the face; it is possible that these on occasion contained either incense or a lighted wick. One of the female figures is wrapped in a cloak or blanket. The comparatively scarce male figures, when complete, are naked. The horned figures probably represent a god while the occasional naked and bearded figure is almost certainly a votary.

At Harappa there are certain local types not found at Mohenjo-daro. A number of female figurines, undoubtedly representing priestesses or votaries, are shown with both arms raised to their heads, on which is a voluted object — possibly

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

a headdress, but more likely some sacred article. Mention has already been made of the squatting male figures peculiar to Harappa, which may represent slaves as ex-voto figures in lieu of human sacrifice discontinued on economic rather than humanitarian grounds. It is likewise possible that many of the animal figurines were votive; round the neck of one ox is a flanged collar similar to those worn by the slave figures; into the sides of the collar are thrust cone-shaped containers, perhaps for incense or some other form of offering. Rosetted headdresses are also an exclusive feature of the Harappa female figures. Chanhu-daro produced relatively few figurines of any kind, while a peculiar bulging type, of which a few came to light at Mohenjo-daro, may represent a pregnant woman and may have served a talismanic function, ensuring either pregnancy or a safe delivery. Such animal figurines as a climbing monkey pierced with holes out of alignment so that its movement on a string is checked, an ox with a movable head, birds (with open or closed wings) on pedestals, and bulbous bird-whistles in the form of a hen, were certainly toys.

Almost without exception these terra cottas have been well fired under oxidizing conditions so as to be fired pink throughout. Many of the human figures have a thin red slip, applied as a finish and preservative. It cannot be said that any of these crudely modeled figurines have much artistic merit. The plain, working potters who turned them out in large numbers probably catered to a clientele who demanded an object having certain religious and luck-bringing properties; the efficacy of the item was not reduced by its stylized appearance, restricted by the limited capability of its maker. A figure of a monkey (?) holding a young one on its knee has a certain naturalism and vital expression wholly lacking in any of the others. Distinct from these crudely modeled figures are a few well-modeled images of bulls, in which great care has been taken to reproduce the anatomy correctly and to finish the figure carefully by clever carving. These may be the product of a single individual who was a true artist. Comparable to these impressive animals is the small figure of a bull finely carved in steatite, a stone carved almost as easily as clay.

The pottery of the Harappa culture (see CERAMICS) was a very utilitarian style of ware. The museum at Mohenjo-daro at one time contained many shelves full of rather undistinguished pink pots in a limited range of shapes, of which the most elegant are the elliptical vases, Mackay's types R and S from Mohenjo-daro, and Wheeler's type XXIX from cemetery R37 at Harappa. The greater part of the household wares are bowls with slight variations of profile; pots with a variety of rim openings narrowing to bottle-necked types; dishes, with and without pedestal stands; pointed-base beakers (in the upper levels); and a certain number of storage jars, the largest being 3 ft. high.

There must have been a fair number of pots decorated with black paint on a polished red slip, but few have survived intact (PL. 70). Some of these are quite striking, with a bold pattern of intersecting circles (III, PL. 121), but the rather crowded designs of foliage, fringed circles, comb patterns, peacocks, and checkered squares generally present a scene of tasteless muddle. Some of the earliest wares found at Chanhu-daro, Lohumjo-daro, and Jhukar, painted in black, often on a cream slip, are much more attractive. Their simple and uncrowded decoration consists usually of a branching pipal tree growing from a small mound of earth, such as is found on Kulli shards from Baluch Makran, and a discontinuous horizontal zigzag with corner dots, such as is found in early Iranian wares from Tepe Giyan and Tepe Sialk.

Jewelry. It is clear from the necklaces, bracelets, and girdles shown on the terra-cotta figures that women of this region habitually adorned themselves with these trappings. One elaborately finished figure boasts an impressive girdle; by good fortune a girdle of this identical type was recovered complete (VI, PL. 243). Long narrow carnelian heads (3 $^3/_4$ in. in length) were strung in groups separated by narrow spacers flanked by small spherical beads. At one end is a flat hemispherical terminal of copper. Terminals and spacers, recovered in some numbers, are made of such varied substances as copper, bronze, steatite, and faïence, while the terminals, which may be triangular, are occasionally of gold. The majority of the beads are of steatite or faïence, but there are also beads of various semi-precious stones, such as agate, carnelian, jasper, and amazonite from Gujarat, as well as scarce jade from central Asia or Burma and lapis lazuli from Afghanistan. The common shapes are barrel, cylindrical, and spherical. Most beads are plain but some are decorated, the favorite pattern being the trefoil featured on the robe of one of the pieces of statuary. Frequently these trefoils are produced by drilling or chiseling the surface of steatite barrel beads, but some are etched in white or, in rare instances, black, on carnelian barrels; the etching is done by drawing the pattern on the surface with an alkali solution such as carbonate of soda, then heating the bead to produce absorption of the alkali, and thus yielding a permanent pattern. This process was perhaps an invention of the Harappan civilization; examples found at Ur, Tell Asmar, and as far afield as Tepe Hissar all have typical Harappan patterns. This method of decorating beads, widespread in India during the early historic period, survives to the present day.

A very peculiar style of bead, a flat gold disk with an axial tube, formed part of a necklace unearthed at Mohenjo-daro. Such beads, also copied in faïence, are similar to some found at Ur and in Troy II*g*, so that a date of about 2300 B.C. is suggested. Segmented beads of faïence, found particularly at Harappa in some numbers, though of a type which is widespread both in time and space, have been found by the application of spectrographic analysis to be identical in composition to similar beads from Knossos in Crete, dated to about 1600 B.C.

Bracelets and bangles, especially those of pottery, are common; many are so small that it appears doubtful they could have been worn. More costly examples appear in gold, silver, copper, bronze, faïence, and conch shell.

THE ARYAN INVASIONS. Toward the close of the 3d millennium B.C., following the fall of the dynasty of Akkad, which had held in subjection all its border peoples, there is evidence throughout western Asia of troubled times and of the incursion into settled lands of warlike barbarians, probably either of Aryan speech or led by an Aryan element. It was at this time that Guti barbarians from the north invaded Sumer and Akkad, and from about 2100 B.C. onward the sites on the high plateau of Iran passed into the hands of these warrior-dominated peoples. That some were Aryan in speech cannot be doubted; in the course of the tribal conflicts of those times, involving movements of peoples in the general area of Anatolia, the Caucasus, and Iran, it is clear that some of these folk, certainly with an ever-increasing Aryan component, were impelled eastward.

The desert country of Makran with its sparse oases and the narrow hill valleys of the Indo-Iranian borderland did not invite settlement by the invaders. There is little except devastation to mark their passage in those regions. About 1800 B.C. all the peasant farming communities of Baluchistan and Makran came to an end. The long-lived cultures of Kulli and Nal and the Periano Ghundai culture of the Zhob all disappeared, to be replaced only in occasional instances by pottery of a new and inferior type, marking the settlements of intruders with less efficient potters.

Archaeological proof of the arrival of the Aryans in India is as difficult to obtain as is that of their existence in the lands from which they came. As they left no literary remains inscribed on stone or clay, it cannot be asserted with certainty, but only deduced, that those who dispossessed the Harappans and destroyed their culture were peoples of Aryan speech. They came certainly from the Iranian plateau; they brought with them weapons of a type that can be associated with warrior peoples of that land, many of whom must be accounted as Aryan at this period. The period of invasion lasted a long time, possibly 400 or 500 years; it consisted of a series of incursions which may have grown in strength and intensity as did the Śaka and Islamic invasions of historical times. Though the coming of the Aryans to India has been the subject of a vast literature since the end of the 18th century, only in the 20th century were discoveries made that subsequent research has shown can

UP State Museum, Lucknow

be associated with that incursion. Graves at Khurab in Persian Makran, still more graves at Shahi Tump in Baluch Makran, and settlements in the Indus Valley mark the advance of the earliest invaders and their arrival at their objective.

The first evidence of this contact in the borderlands is an ax found in a grave at Khurab. For a long time described by writers as a wand, this object has been shown to be a shaft-hole ax of a rather specialized type. It has a very narrow blade; the figure of a squatting camel appears on the back of the socket; the distance from the head of the camel to the edge of the blade is about 7 1/4 in. Axes of this type, with narrow blades and animal figures, come from Til Barsip (mod. Tell Ahmar) in Syria, Van, and Luristan (ca. 2100–1700 B.C.); the Khurab ax and its associated graves are likely to date to about 1900 B.C. or somewhat later. Farther to the east, at Shahi Tump, were unearthed a number of interesting graves containing a strange and poorly made pottery with clearly archaistic patterns (produced as burial goods rather than for daily use), as well as a shaft-hole ax of copper and compartmented seals. The seals have parallels in the cultures of Tepe Hissar III*b* and Anau III and so suggest a settlement founded about 1800 B.C. Other than the destruction they caused, no further traces of these invaders are found until their settlements in Sind are reached. At the site of Nal in southern Baluchistan the final habitations of intruders from the Zhob in the north were burned, and the whole Baluch culture of peasant farmers with distinctive pottery came to an end. The Harappan towns of Chanhu-daro, Lohumjo-daro, and Jhukar were taken over by those who are called the Jhukar people at a date which can be set theoretically at 1700 B.C. Sufficient material connected with this occupation was recovered at Chanhu-daro to give some substance to knowledge of these invaders and to provide a clue to their origins and stage of cultural development.

A shaft-hole ax and compartmented seals align the Jhukar people with the people whose graves have been found at Shahi Tump. Single-loop pins of a type found at Tepe Hissar III, tweezers at Anau III, a bead of whorl type (also characteristic of the cultures of northeast Iran) found at Lohumjo-daro, and an object originally thought to be a kohl jar but finally identified as a macehead with its parallel in Tepe Hissar III, all indicate that this people sprang from Iran early in the 2d millennium B.C. In addition, there are stamp seals which accord with this time and place of origin, including a seal from Jhukar, with a Maltese cross almost identical with one from Anau III, as well as continuous-loop and schematic bird patterns similar to some from the Hittite site Alaca Hüyük. These invaders must have been illiterate; nowhere is there an inscription of any kind whatsoever. Though some of the simpler elements of decoration on painted Jhukar ware are similar to those found on Harappa ware — for instance, the patterns based on intersecting circles, checkered squares, and barred-leaf foliage — the general appearance of the bold Jhukar patterns in black and red on cream is totally dissimilar. It may be that the Jhukar people pressed Harappan potters, particularly captive women, into their service; moreover, the general heritage of Iranian pottery design had persisted to some extent from Amri times. Even so, the Jhukar people had a very characteristic and quite unmistakable pottery of their own. Aside from this they produced nothing at all of real esthetic value; they were an even less artistic people than the Harappans.

THE END OF THE HARAPPA CULTURE AND ITS INFLUENCE ON THE INVADERS. It is probable that the obliteration of the Indus Valley civilization through the continued impact of fresh arrivals from the west took a fairly considerable time; it is likely that the total number of invaders was measured in tens rather than hundreds of thousands, and that the Harappans did not succumb everywhere and at once to their onslaught. This is the only picture that fits both the practical probabilities and a reasonable interpretation of the *Ṛgveda*. From this collection of very early hymns, written in the earliest form of Sanskrit, it is plain that there were dissensions among various groups of Aryan and semi-Aryan invaders and that compromises were made with the Harappans, with whom must be identified the Asuras and the mercantile Panis, whose cities the Aryans overthrew with the aid of their god Indra.

It is likely that the city of Mohenjo-daro continued to maintain itself against the newcomers long after the destruction of the Harappan towns of Lohumjo-daro, Chanhu-daro, and Jhukar, which probably fell in that order during the period 1700–1600 B.C. Weapons foreign to Harappan types were discovered in the uppermost levels at Mohenjo-daro: an adze-ax of a type found at Hissar between 1800 and 1600 B.C.; dirks and daggers having a raised midrib and rivet holes for securing the hilt (frequently two holes at the base of the blade), implements which have parallels in Syria and Palestine dating from 2000 to 1900 B.C. It would appear that the dirks and daggers were either goods hidden while the city was undergoing assault or were loot cached, but not recovered, by an invader during the sack of the city. Nor need the adze-ax be assumed from its position to be a weapon of the final conquerors. It is far more likely that all these western weapons were acquired by the Mohenjo-daro people from their new neighbors, with whom they had temporarily come to terms, or that they were the property of westerners who had taken up residence in the city, possibly as mercenaries.

That Mohenjo-daro was finally assaulted and sacked is evident from the bodies found in various parts of the city; everywhere the circumstances indicate that these bodies, some of them bearing the marks of their death wounds, lay abandoned where they fell. Meanwhile, at a date which may well be somewhat earlier than the destruction of Mohenjo-daro, the city of Harappa, far to the north, came under pressure from the invading barbarians, as the blocking up of one of the city gates shows. Here the conquerors settled on the site, erecting ill-constructed hutments with bricks taken from the ruins of the Harappan houses. The characteristic painted pottery of these folk, called the "Ravi people" from the river by which they lived, can be recovered from the surface of the entire site, particularly from the citadel mound.

To provide track ballast for the railway the site of Harappa was stripped of bricks to such an extent that the upper levels, where Ravi pottery is relatively thick on the ground, elude scientific interpretation. There are signs of contact with the Harappa culture. In one of the pot burials were found articles which cannot well be regarded as gleanings from the site many centuries after it was abandoned by the Harappans; included are pieces of two triangular cakes and a pointed-base Harappan goblet. With other objects, these were embedded in the generally ashy contents, along with charred bones. Dishes on pedestal stands appear to have been adopted from the Harappans by the Ravi people as well as by those at Jhukar. Moreover, though the general appearance and decoration of Ravi ware is quite distinct, there are many similarities in decorative detail. Patterns derived from the Harappa culture include rayed-star forms, pipal leaves, vertically arranged eye forms, and leaves with stems radiating from a circle. The humped bulls, peacocks, fish, and antelopes which appear on Harappa ware and that of the Indo-Iranian border are common on Ravi pottery but are very rare in later times.

Recent excavations at Rupar in East Punjab and at the neighboring site of Bara have brought to light pottery with such elements of decoration as arrowheads between horns, fishlike objects with vertical hatching and forked tails, large irregular five-pointed stars, and a circular motif with triangular points, quite different from Harappa ware but characteristic of Ravi ware. As this pottery level divides the late Harappan from the level of painted gray ware (ca. 700–400 B.C.), it may be regarded as reasonably certain that the Ravi people were those who brought about the destruction of Harappa about 1600 B.C and that Mohenjo-daro did not fall until about fifty or so years later. It may well be also that in the people of Ravi II the Vedic Aryans can be recognized.

The single definite and abiding influence exercised by the Harappans on the invaders was in the matter of religion. The priestly caste of Brahmans would appear to derive directly from the Harappans, introducing from them such elements as phallic worship and the worship of Śiva, the three-faced

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

horned ithyphallic god. It is indeed unlikely that, short of complete extermination, the literate Harappan priesthood, with the entire tradition of the Indus civilization behind it, could fail to make a strong and lasting impression on the religious ideas and practices of India, no matter what invaders might penetrate the western passes through the ages.

In Sind the Jhukar culture degenerated into groups of fishers and hunters who reverted to a proto-neolithic style of living and are known only from their pottery, which is accompanied by microlithic flakes. They are named after the type sites of Trinhi and Jhangar; there is some doubt as to which of these two groups is the earlier and to what period they should be assigned. Although both styles appear at Chanhu-daro, they were found in different localities, and there is as yet no evidence of sequence. The original discoverer of these wares considered Trinhi the older. The greater part of the Jhangar pottery is handmade gray ware with incised decoration. A connection with the period of invasions is indicated by a triple jar found at Chanhu-daro, its three bowls joined by tubes. Since jars of this type were found at Shahi Tump in the late cemetery, in Iran at Tepe Sialk in the graves of Necropolis B, and at Shah Tepe, there is clearly a connection with the intruders from the Iranian plateau. It is likely, therefore, that these two groups of pottery, Trinhi and Janghar, may provide clues about the very enigmatic period from 1400 to 1100 B.C.

Pottery having a cream slip, bands of red paint, and a simple decoration of plain and wavy black circumferential lines, found in the Zhob at Periano Ghundai, gives an impression of association with Jhukar ware, while succeeding types with various forms of carelessly executed polychrome designs are likely to be contemporary with Trinhi ware. Moreover, some of this ware found at Rana Ghundai can be classed as Loralai V, which is followed by the three phases of Loralai VI, the long and intermittent period that introduces early historic times.

These evidences of a retrogression into barbarism of a low type bring to a close all knowledge of the Indus civilization and of its immediate predecessors and successors.

SURVIVALS OF THE HARAPPA CULTURE. Although attempts have been made to suggest the survival of certain elements of the Harappa culture, it is doubtful whether any of the instances advanced are anything but fortuitous similarities. It is true that certain early cast coins of Ajodhya do possess most of the characteristics of the Harappan seals; one, indeed, has all of them, save that the animal, if viewed as an impression, faces the wrong way. The coin is square and, below an inscription, has an animal facing a manger. But even this striking similarity presents the insuperable difficulty that more than 1,200 years intervene, with no connecting link of any kind. Some motifs, such as the hero subduing wild beasts, are so common and enduring in the ancient world that late examples cannot be used with any confidence unless a succession can be shown in India to span the dark ages which separate the Indus civilization from historic times. It is true that this motif appears on Ravi pottery, but it is not found again until it occurs in the Mahadeo Hills in a rock painting which at the very earliest cannot be dated prior to 500 B.C.

Both seals and terra cottas are evidence for bull sacrifice and possibly for bull sports; the possibility of a connection with the Minoan religion has been suggested, and Crooke (1917) collected a number of Indian ritual practices in which bulls fight or are baited, including one in which cloth bows are plucked from bulls' horns. Such bows are depicted on rock bruisings at Kupgallu near Bellary. Some of the objects included in these bruisings appear to be mounted on T-shaped stands of the same form as the processional standards of the Harappa culture. Again, however, the interval of distance, time, and space makes speculation very hazardous. Bull sports are not so uncommon that diffusion might not have taken place at any time; though a connection is, of course, possible, bull sports are among those enduring practices which pervaded the whole ancient world.

The fact that such objects as shell bangles, knob-handled pot lids, etched carnelian beads, and painted pottery that were made in Harappan times can be found quite commonly on most early historic sites and are produced today demonstrates, with no other particular significance, the persistence of such elements in a society which has undergone little basic change. One such pattern, however, while possibly only coincidental, does suggest survival: terra-cotta birds which very closely resemble types found on Harappan sites, and all on pedestals in the Harappan manner, have come to light in the setting of early historic Gandhara (now in northwest Pakistan); these objects include a spread-winged bird from the Bālā Hissār, Charsadda, a closed-winged bird from Sar Dheri, and a bird rattle from Taxila, identical with Harappan bird whistles.

The more definite examples of survival are all connected with religious ideas and practices. The god seated in a yoga position, with a horned trisula-shaped headdress, ithyphallic, three-faced, and surrounded by animals to show him as Paśupati (Lord of Beasts), is without doubt the prototype of Śiva. His place in Hinduism (q.v.) and the attendant sexual symbols of linga and yoni are survivals from the religion of the Indus Valley which are wholly foreign to the religious ideas of the *Ṛgveda*. One very strange occurrence may be, again, only a coincidence, or it may have some inherited religious significance: the intentional longitudinal division of female terra-cotta figurines observed at Harappa and at early historic sites in Gandhara. Careful examination has shown that this splitting cannot be accidental. Painted pottery still made at Balreji in Sind has less specific significance in relation to the survival of this art than has been assumed. Similar pottery is made near Quetta in Baluchistan, at Gujargarhi near Mardan, and in the vicinity of Rawalpindi, all in northwest Pakistan; it is probable that this art of painting pots has continued in a sporadic fashion ever since its introduction by the peasant farmers of the Amri culture.

INGRES, JEAN-AUGUSTE-DOMINIQUE. The dominant figure of the French neoclassic school of the 19th century, Ingres was born in Montauban on Aug. 29, 1780. He received his first instruction in drawing from his father, Joseph Ingres, a sculptor of ornamental work versed also in architecture, painting, and music. In 1791 the young Ingres went to Toulouse, entering the Academy to study painting under Roques (winner in 1779 of the Grand Prix de Rome), sculpture under Vigna, and landscape painting under Briant. In the summer of 1797 Ingres set out for Paris with a letter of intro-

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

duction from Roques to David, who accepted the student into his atelier, then the largest, liveliest, and most famous on the Continent.

In October, 1799, Ingres entered the École des Beaux-Arts and, about three months later, won first prize in the category of half-figure painting. In March, 1800, he placed second in the preliminary contest for the Grand Prix de Rome, executing a painting (now lost) of the assigned subject, *Cincinnatus Receives the Deputies of the Senate*. A month later he entered the Prix de Rome competition officially, and in October received word that he had been awarded second prize. Ingres's painting of the subject chosen for the year, *Antiochus Sends His Son to Scipio*, is now known only through a photograph, the original having been destroyed by fire in 1871. In the spring of 1801 he entered the Prix de Rome preliminaries for a second time and was again classed second, but in September he carried off the first prize with *The Envoys from Agamemnon* (Paris, Mus. de l'École des Beaux-Arts).

Ingres exhibited for the first time at the *Salon* in September, 1802. In the summer of 1803 he was commissioned to paint for the city of Liège a portrait of *Bonaparte as First Consul* (Liège, Mus. B.A.), which was unveiled in the Liège town hall in 1805. In September, 1806, he exhibited at the *Salon* his portrait of *Napoleon I on the Imperial Throne* (Paris, Mus. de l'Armée); the three superb portraits of the Rivière family: father, mother, and daughter (PL. 73), all now in the Louvre; several portraits of friends; and his *Self-Portrait* (Chantilly, Mus. Condé). The *Salon* opening was delayed, but Ingres received the Grand Prix money he had been awarded in 1801 for study in Rome (payment having been delayed by economic difficulties owing to political and military reverses at that time), and so he set out for the Eternal City without seeing how his paintings were hung. One can understand his bewilderment and rancor upon hearing how poorly hung, severely criticized, and stupidly judged were his entries.

The greeting given him by Joseph Benoît Suvée, the director of the French Academy, upon Ingres's arrival in Rome in October, 1806, was balm to his injured pride. He spent a few weeks in the Villa Medici, the new home of the French Academy (where it is still located), and Suvée then offered the young Montalbanais the small atelier of San Gaetano on the Pincio as a studio. It was there, probably shortly before the summer of 1807, that he painted two of his rare landscapes, the small circular views of Rome now in the Musée Ingres in Montauban.

During his four years as a pensioner at the Academy, Ingres copied the old masters, especially Raphael, and painted the famous turbaned nude with her back turned, called the *Grande baigneuse* or *Bather of Valpinçon* (Louvre), the so-called *Sleeper of Naples* (now lost), and *Oedipus and the Sphinx* (Louvre). Instead of returning to France when his term was completed, he took a studio at 40 Via Gregoriana. Two friends whose acquaintance he had made in Rome, the engraver Édouard Gatteaux and the government official Charles-Marie-Jean-Baptiste-François Marcotte d'Argenteuil, obtained for Ingres his first commissions in Italy; these two Frenchmen remained his loyal and devoted friends for life.

In 1811 Ingres sent his *Jupiter and Thetis* (PL. 71) to the Académie des Beaux-Arts, but the official criticism it received was even more devastating than the attack leveled upon the portraits he exhibited in the *Salon* of 1806. He was accused of misusing his talents and was exhorted to change his ways. In these circumstances, his friendship with Gatteaux and with Marcotte, director of Waters and Forests, served him in good stead. Through these friends Ingres met other French officials in Rome, among them the Baron de Tournon, prefect of Rome, and General Miollis, governor of the French-occupied city. Ingres was commissioned to paint the portraits of Marcotte's relatives, M. Bochet (Louvre) and Mme. Panckoucke, née Bochet (Louvre); a portrait of the Baron de Tournon's mother (Philadelphia, Coll. Henry P. McIlhenny); and a painting of *Vergil Reading the Aeneid* (Toulouse, Mus. des Augustins) for the Villa Aldobrandini, a commission secured through General Miollis. Ingres also painted a *Dream of Ossian* (Montauban, Mus. Ingres) for a ceiling in the Quirinal Palace, to decorate the Emperor's bedroom for the latter's projected visit which was never realized. At this time, too, to have their portraits drawn, there sat for him not only many of his friends and fellow artists but also a succession of officials whose business had brought them to the Eternal City.

In 1813, on the advice of Mme. de Lauréal, whose acquaintance he had made in Rome, he wrote to her cousin, Madeleine Chapelle, a modest milliner of Guéret, asking her hand in marriage. Madeleine accepted the offer and journeyed alone to Rome, where they were married in December.

The following year Ingres was commissioned to paint a portrait of Queen Caroline Murat and her family, and so he went to Naples. Before the Murat portraits were completed, Napoleon was defeated, and the Bourbons returned to rule Naples; with the fall of the Empire, Ingres's official French patrons disappeared from Rome. However, the French Academy continued at the Villa Medici, and through the new director, Charles Thévenin, Ingres was given a commission for a *Christ Giving the Keys to St. Peter* (Louvre). English noblemen, free once again after the Napoleonic Wars to make the grand tour, flooded Rome; many of these visitors, learning of Ingres's talent as a portrait-draftsman, flocked to him. Although he disliked the work and begrudged the time it took, the artist accepted the commissions because he needed the modest income these sitters brought him. His paintings in the *Salon* of 1814, the *Don Pedro of Toledo* and several other portraits, were badly received. To the *Salon* of 1819 Ingres sent his *Grande Odalisque* (Louvre), commissioned by Queen Caroline Murat but never delivered, and *Roger Freeing Angelica* (Louvre; PL. 75), but once again his work was given a hostile reception.

During the decade 1810–20, in the Via Gregoriana studio, Ingres painted his first versions of many themes to which he was to return in later repetitions and variations: *The Betrothal of Raphael to the Niece of Cardinal Bibiena*, *Raphael and the Fornarina*, *Paolo and Francesca*, and *The Death of Leonardo da Vinci*.

In David's atelier in 1799 Ingres had made friends with Lorenzo Bartolini, then an unknown, ambitious sculptor, who later settled in Florence and became very successful. Bartolini urged Ingres to leave Rome and live in Florence; Ingres accepted the suggestion, at first even living with Bartolini and his family. During his four years in Florence, from 1820 to 1824, he was received warmly by three families who gave him commissions for both painted and drawn portraits: M. and Mme. LeBlanc (paintings in the Metropolitan Museum, New York); a member of the Gonin-Thomegeux family (Cincinnati, Taft Mus.); and M. and Mme. de Pastoret (Paris, private coll.). It was at this time, too, that he painted the portrait of Gouriev, the Russian Minister (Leningrad, The Hermitage) and made the portrait drawing of the Austrian Minister, the Comte de Bombelles (location unknown). During his leisure hours he copied Titian's *Venus* in the Uffizi (location of his copy unknown) and Raphael's *Self-Portrait* (Montauban, Mus. Ingres). He also painted, on commission for his native town, the *Vow of Louis XIII* (Cathedral, Montauban).

Although deeply sure of his powers as he slowly brought the *Vow of Louis XIII* to completion, he was uneasy about the reception the painting would be given when shown in Paris at the *Salon*. He went to Paris in the autumn of 1824 for the exhibition. To his astonishment, the painting was a tremendous success. The tide had turned: at the *Salon's* close, Ingres was presented the Cross of the Legion of Honor by Charles X himself and a few months later was elected a member of the Académie des Beaux-Arts. At the end of that year Ingres opened a studio in Paris and began to receive pupils. Over a hundred students flocked to follow his instruction, first among them being Eugène Emmanuel Amaury-Duval, who later became his biographer.

In 1826 Ingres was commissioned by the director of the museums of France to paint *The Apotheosis of Homer* (PL. 71) as a ceiling decoration in the Charles X Museum at the Louvre. The finished painting was put into place a year later. The artist was appointed a professor at the École des Beaux-Arts

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

in 1829; in 1832 he was made Vice President, and in 1833 President, of that institution for the year following each nomination.

Ingres had been commissioned in 1824 to paint, for the cathedral of Autun, a large altarpiece of *The Martyrdom of St. Symphorian*, a local saint. He worked on it for ten years, but the picture he produced was not one of his successes. Overloaded with archaeology, crowded with people, and coldly dramatic in composition, the painting was poorly received at the *Salon* of 1834. His feelings again injured, Ingres returned to Rome, where he succeeded Horace Vernet as director of the French Academy. He introduced many improvements at the Villa Medici, both in the physical plant of the school and in its courses of instruction. The master eventually finished the *Odalisque with Slave* (Cambridge, Mass., Fogg Art Mus.), which he had begun for M. Marcotte in 1834; *Antiochus and Stratonice* (Chantilly, Mus. Condé), which the Duc d'Orléans had commissioned the same year; and his first version of the *Virgin with the Host* (Moscow, Pushkin Mus.), for the Czarevitch.

He returned to Paris in the spring of 1841. His entry was triumphant. During the 1840s he completed some of his finest portraits: the original portrait of the Duc d'Orléans and several replicas of it; and the portraits of Mme. d'Haussonville (New York, Frick Coll.), Mme. Reiset (Cambridge, Mass., Fogg Art Mus.), Mme. Gonse (Montauban, Mus. Ingres), the Princess de Broglie (Paris, private coll.), and the Baronne James de Rothschild (Paris, Coll. Baron Édouard de Rothschild). He also began the decoration, commissioned in 1839 by the Duc de Luynes, of the Château de Dampierre with two large allegorical panels to be called *The Golden Age* and *The Iron Age*; the first was nearly complete when he left Dampierre for good in 1847, but only a sketch had been executed for *The Iron Age*.

In July, 1849, the artist's wife died, and he went traveling in the north of France to forget his sorrow. Two years later he finished his first portrait of Mme. Moitessier (Washington, D.C., Nat. Gall.; PL. 74) and in that same year (1851) he deposited the first big selection from his own collection in his native Montauban and resigned his professorship at the École des Beaux-Arts. Once again through his friends a marriage was arranged, this time with a relative of the Marcottes, the forty-three-year-old Delphine Ramel. The second marriage was as successful as the first.

During 1853 Ingres was chiefly occupied with the now destroyed *Apotheosis of Napoleon I*, a painting commissioned by the Préfecture to decorate Napoleon III's Salon in the Hotel de Ville. When the canvas was finished in February, 1854, the Emperor and Empress themselves came to the artist's studio to view it. The largest showing of Ingres's work during his lifetime occurred in 1855 at the Exposition Universelle. He was given a separate room in which to arrange 43 paintings and 25 of the cartoons for the stained glass of the Chapelle Royale in Dreux and the Chapelle of St-Ferdinand in Paris.

A year later he finished his second portrait of Mme. Moitessier (London, Nat. Gall.) and *The Source* (Louvre), a painting he had begun in Florence about 1820 and which he had kept in his studio during the intervening years. In 1861 he finished *Homer and His Guide* (Brussels, Coll. of H. M. the King of the Belgians) for King Leopold I of Belgium, and, in 1863, brought *The Turkish Bath* (Louvre; PL. 72) to its final form. His *Self-Portrait about the Age of 85* he sent in 1865 to Antwerp (Mus. Royal B. A.); it was a copy of the self-portrait he had painted at the age of seventy-nine for the Ramel family (Cambridge, Mass., Fogg Art Mus.). His last large religious canvas was *Christ among the Doctors*, commissioned by Louis Philippe in 1842 but only completed 20 years later. It was still in his studio at the time of his death and went, along with several thousand drawings, his notebooks, and his library, to the museum in Montauban.

Ingres died on Jan. 14, 1867. As late as six days before his death, he was still drawing and still seeking to learn from the old masters.

Agnes MONGAN

The unqualified antagonism that has been posited between Ingres, the defender of the classical tradition, and Delacroix, the recognized head of the romantic school, has proved of little help in arriving at a just evaluation of Ingres's art, for his art cannot be reduced to the defense of certain principles. His adversaries included some of the strictest academicians as well as the romantics; yet some of his themes fall completely within the sphere of the romantic idiom, while his art — on the borderline between neoclassic and romantic — did not succumb, despite its conservative element, to the movements spawned by romanticism. Throughout the 19th century, the name of Ingres was associated with every effort to reaffirm, despite trends to naturalism and realism, the value of drawing, plasticity of form, and the eternal, suprahistorical character of art. This search for the "idealistic" was manifest not only in contrast to or alongside impressionism (as, for example, in the so-called "nouveau humanisme" or in the work of Puvis de Chavannes), but it also existed within the framework of impressionism itself, in which the quest was continued for both the structure of color and light as well as for a precise sense of space based on sensory experience. Toward the end of the century both Renoir and Degas went through an Ingres period.

The extent to which the painting of Ingres differs from the intransigent neoclassicism of David is obvious: in Ingres's drawing there is a tendency toward purity and fluidity rather than firmness and vigor of line, and he used chiaroscuro not so much for the purpose of modeling plastic form as for delicate modulation of tones and halftones, while his color is often brilliant and produces extraordinary harmonies. David's ideal was the antique in its severest, most sculptural forms, and his classicism usually bears a moral or civic message.

Ingres's ideal model was Raphael, and his mode of expression is elegiac rather than epic. Ingres also looked to Reni, Domenichino, and Poussin, who especially influenced his historical and religious compositions. These works are pervaded by that same mixture of austerity and pensiveness that the 17th-century painters revealed, reflecting not so much a firm faith in the authority of classicism as a regret for a golden age that, though past forever, lives on as a symbol of inner choice and of aspiration toward unattainable perfection. In short, the classicism of Ingres is not a theory, nor the teaching of any school; it is the result of a profound feeling for history, a kind of contemplative spirituality that may, in fact, be related to a deep Christian piety and (particularly in his pictures of historical subjects) to a pathos that may be termed romantic. As the romantic writer Théophile Gautier said, "Ce n'est plus de l'archaïsme mais de la résurrection."

It is nevertheless true that Ingres was a pupil of David, but the classicism which Ingres sought he found not so much in works of art as in poetry, especially in Homer and Vergil. This again demonstrates that antiquity was for him a source of inspiration rather than an abstract doctrine.

Significantly, Ingres, the pupil of the most celebrated of neoclassical painters, examined with interest the works of English and German neoclassicists. He studied the publications of the collector Sir William Hamilton and borrowed from the line engravings of Flaxman (q.v.) and Tischbein. He admired their historic sense, which was certainly less eloquent and impassioned but more reserved and contemplative than David's. Flaxman, in turn, extolled above David's works Ingres's *Envoys from Agamemnon*, for which Ingres had won the Prix de Rome in 1801. Through classicism David attempted to place himself in harmony with the heroic spirit of the revolution and the Empire, whereas Ingres sought to recapture the memory of a wonderful bygone era. In 1806, when Ingres depicted Napoleon enthroned, showing him in a hieratic pose perhaps better suited to a painting of St. Louis, the picture appeared — with reason — "Gothic"; his disagreement with David, growing more bitter as time went on, might even have had a political basis. That Ingres was interested in the themes of the early romantic movement as well as in neoclassical subjects is, moreover, proven by the fact that he painted his *Dream of Ossian* in 1813, only a year after executing one of his most classical compositions, *Romulus and Acron*.

Outstanding in the evolution of the salient features of Ingres's art was his search for complete calm and formal purity.

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

Inventiveness of composition did not greatly interest him, for Ingres, in contrast to David, developed only a few themes, which he frequently repeated and elaborated. His compositions are impressive for their rhythmic unity of form and line and for the extreme clarity with which each detail of the painting is fitted into the ensemble. His portraits are posed very simply. His female nudes, which he saw as forms of great perfection, are only occasionally brought together as participants in an event, as for example, in *Roger Freeing Angelica* of 1819 (PL. 75). Complex compositions such as *The Turkish Bath* of 1862–63 (PL. 72) are, in large part, developments of formal themes that he often treated in pictures of bathers and odalisques. The symmetry of parts and the calculated crescendo of his great decorative compositions (*Apotheosis of Homer*, 1827; PL. 71) can be related more closely to structural devices in choral music (Ingres was a fine musician) than to architectonic principle. The extreme simplicity of some of his religious paintings — *Ste Germaine de Pibrac* (1856; Montauban, church of St-Étienne de Sapiac), for instance — even borders on the ingenuousness of the popular devotional image. At times it almost seems as though Ingres gave in to the temptations of conventional sentimentality, as if in defiance, or in order to show that nobility of form could redeem any kind of content.

The famous "dessin" of Ingres is no formal abstraction but the expressive means by which the artist re-creates his feeling for nature and history. The landscape drawings of his first Roman period are a good illustration of this process. The extreme precision of his draftsmanship eliminates all emotional accents, defines space with great clarity, and even indicates color. Just as the drawing supplies a unified contexture, so the color forms a basic tonal harmony within which each individual hue can attain perfection of tone without disturbing the unity of the whole composition. "Modeling," Ingres said, "should not be squared and angular; one should model round and without apparent internal particulars." Indeed, not limited to supplying description and structure, Ingres's drawing follows a rhythmic course sensitive to variations in feeling. It is this treatment of line that made Ingres's art appear "Gothic" to his contemporaries. In its outward coolness but inward emotion, his work appears to have some affinity with that of the Tuscan mannerists, and especially of Bronzino, who seems to have provided inspiration for such paintings as the *Grande baigneuse* (1808) and the *Petite baigneuse* (1828; PL. 71).

The "purism" of Ingres, which consists precisely in this expressiveness contained and almost sublimated within the tight, severe rhythms of his form and color, receives greater stress in his later works, especially in the portraits, and in religious compositions, such as *Christ among the Doctors* of 1862. On the one hand, these paintings recall the neoprimitivism and the subtle archaism of an artist like Sassoferrato, while on the other hand, they are part of the religious current of the mid-19th century that pervades the painting of the German Nazarenes, the Italian Puristi, and the early English Pre-Raphaelites. Yet, since *Christ among the Doctors*, which Delacroix judged "the sad outcome of an age past hope of redemption," was painted in the same year as *The Turkish Bath* (in which Raphaelesque curvilinear rhythms are united to Titianesque sensuality of color), it is apparent that the subject was only a vehicle for Ingres's search for purity of form. The fact that Ingres was engaged in such a search for perfection of form, necessitating clarification of his own inner motives and reassessment and refinement of his means of expression, helps to explain his reluctance, already mentioned, to indulge in compositional invention, in the grand effect, and in novel solutions to problems of form. It explains, above all, the acute *esprit de finesse* that pervades his painting and that has for so long seemed the expression of a strictly rational attitude toward form.

INLAY. Ornamental or figural work produced by setting together upon a flat surface variously shaped pieces of different materials such as marble, colored stones, ivory, and wood is generally called "inlay." The terms *tarsia*, *intarsia*, and *intarsiatura* are Italian words derived from the Arabic *tarsi*; all denote inlay but are usually employed, especially in Western art history, with more specific meaning. They refer to works of considerable size and of serious artistic purpose, executed on the basis of drawings or cartoons and therefore rather close in intention and effect to painting. Yet inlay refers particularly to the embellishment of furnishings or architecture and thus falls into the more general category of composite decoration obtained by such techniques as joining, inset, and damascening (see ENAMELS; GOLD- AND SILVERWORK; MEDIA, COMPOSITE; METALWORK). Some of these techniques are often the equivalent of inlaid work. Also there exists between inlay and mosaic a technical affinity so close that occasionally the two techniques are used simultaneously in the decoration of the same surface, as in a pavement. However, mosaic, with its small and uniform tesserae, produces effects of chiaroscuro and of color quite distinct from the unmodulated fields, flatness, and rigidity of line peculiar to inlay. But inlay effects are found in the art of stained glass (see STAINED GLASS).

SUMMARY. Antiquity (col. 126). The European West (col. 129). The East (col. 133). Tribal cultures (col. 134).

ANTIQUITY. In Egypt, from the time of the 1st dynasty, inlays of ivory and wood appeared in small coffers, decorated with geometric motifs, found in the royal necropolises at Abydos and Saqqara. Noteworthy are two coffers from the tomb of Hemaka; one is circular with inlays of different woods, and one rectangular, of wood and ivory. As far back as the 4th dynasty, inlay was used on furniture (IV, PL. 343), as in the sedan chair

of Hetepheres I, in which the ebony inlay is itself inlaid with hieroglyphs of gold.

At the same time in the Near East, during the predynastic period (ca. mid-3d millennium B.C.), inlay of semiprecious stones and shell — mother-of-pearl — set into a bed of bitumen was more common. The best example of this work is the so-called "Standard" of Ur (PL. 77; IX, PL. 471), a panel of fine workmanship showing complex and varied scenes. A frieze from al-'Ubaid depicting the milking of cows exhibits a similar technique, but with white as well as colored stones, as do also some panels from Kish and from Mari, which also have inserts of mother-of-pearl. Objects of common use but of finest workmanship, such as certain gaming boards (VI, PL. 5), some musical instruments (I, PL. 505), and de luxe furniture, all share in this technique of inlay incrustation that is proper to the art of the cabinetmaker. There are also some inlaid vases, such as those of Bismaya, in which the skirts of the musicians represented are of white stones set into the surface of the vase.

Such pieces were still being made in the first half of the 2d millennium, and in a great variety of techniques. That has been proved by various finds. Among these can be cited a panel from a wooden box bearing four birds in bone from a tomb at Jericho (PL. 77); an ivory panel from Chuga Zanbil; objects of glazed terra cotta from the early palaces of Crete, made to be inset into surfaces of another material; and the cosmetic boxes of an Egyptian princess of the Middle Kingdom, from Lahun, of ebony with ivory panels inlaid with carnelian, glass pastes of various colors, gold, and four tiny heads of the goddess Hathor made of stones and colored glass paste. All things considered, the procedure is comparable to the insertion of eyes of glass, or of precious stones, or even simply of white marble, in statues and in figures of animals, a very common practice in the entire ancient Oriental world and one subsequently taken over by the Greeks and Romans in their sculpture, both in marble and bronze. The technique is also comparable to the practice of adding finishing touches and descriptive elements to statues and bronzes. But generally all these adjuncts to sculpture do not constitute inlay in the strict sense of the term (see MEDIA, COMPOSITE).

In the category of cabinetmaking, on the other hand, inlaid objects of the highest quality may be found. The tomb of Tutankhamen has provided a rich collection of these in the form of small coffers — some with simple decorative motifs of pierced and gilded wood, enriched with hieroglyphs (first incised, then filled with colored paste), and others with delicately wrought scenes, as on a box inlaid with ivories that project slightly from the red ground, depicting the royal couple walking in a garden (PL. 77) — and in the form of furniture, chariots, and sarcophagi, all adorned with inlays of various woods, glass pastes, gold, and ivory. Small panels covered with inlays of glass paste were not infrequent. These objects continued to be produced up to the Ptolemaic period, though at a lower level of quality.

Within the realm of Cretan art there are small, precious figures of steatite inlaid with rock crystal, mother-of-pearl, wood, and gold, such as the bull-head protoma from Knossos, now in the Archaeological Museum, Heraklion (IV, PL. 64), and the leonine protoma of red jasper on white marble of the same provenance and also in Heraklion. Mycenaean civilization matches that output with small inlaid objects (IV, PL. 71), such as the tiny shields from Mycenae, now in the National Museum in Athens. As regards the oldest Greek culture, there are only literary allusions to objects such as those here described, generally in reference to articles imported from the East, where, in the 1st millennium, the craft tradition underlying this production was still maintained — a fact documented by ivory inlays from Assur and by yew and boxwood inlays from Gordion that were formerly parts of fittings and furniture.

Comparable to inlay are the revetments of glazed bricks (see CERAMICS) of palaces in Mesopotamia and Iran, the alabaster incrustations of the palaces of Crete, and the application of slabs of marble or of varicolored stone to interior and exterior walls, in imitation of structural stonework, in classical architecture. According to Pliny the Elder (*Naturalis historia*, XXXVI, 47), this method of decoration was first applied by Mausolus of Caria in the first half of the 4th century B.C. However, the reference should be taken in a generic sense as indicating that the practice first arose and spread in the Near East and in the Hellenistic world generally and then passed to Rome, whence it spread to the entire ancient world. Πλάκωσις in Greek (*Thesaurus linguae Graecae*, s.v.), *incrustatio* in Latin, or, rarely, *loricatio* (Isidore of Seville, *Originum*, XIX, 3; Vitruvius, *De architectura*, VII, 3, 3, 10; 5, 1; *Panegyricus*, XI, 11), are the terms by which this technique is known in the sources. It appeared in Rome about the middle of the 1st century B.C., and Pliny, in the passage cited, attributed its introduction to Mamurra. Certainly from that time revetments of marble or in imitation of marble were used in every period and in every type of building, both public and private. For example, there are the polychrome revetments of the House of the Relief of Orestes at Herculaneum, those of black marble ordered by Domitian for the imperial palace on the Palatine, the polychrome revetments of the later houses at Ostia, the *crustae* of the Aula Palatina at Trier, and the marble facing of numerous Early Christian and Byzantine churches that culminated in that ornamental placement of slabs at S. Vitale, Ravenna, which exploits the direction of the veining as well as the color.

Strictly speaking, however, inlaid work is called in Latin *opus sectile* or *opus interrasile* (Pliny, *op. cit.*, XXXV, 2). In the first instance, marble slabs are fitted together in jigsaw fashion, all the pieces being of equal thickness; in the second, a thinner slab is set into a larger, thicker piece. The following are some examples of the last type, the *opus interrasile*: slabs of slate from Pompeii decorated with satyrs and maenads (PL. 78), with a scene of offering to an image of Dionysus, and with a female figure leaning against a small pillar; the Colonna slab representing the founders of Rome and the goddess Roma (PL. 78), previously dated between the period of Augustus and that of the Antonines, but which, after careful study, can be placed about the middle of the 4th century; the fragments, formerly in the Hartwig Collection, now lost but recorded in photographs in the Deutsches Archäologisches Institut, Rome; the architectural fragments from Aezani; and the inlay of glass paste, formerly in the Stroganoff Collection, now in the Museo Nazionale Romano.

The term *opus sectile* is usually applied to the decoration of pavement with geometrical motifs (PL. 81). It used to be believed that such decoration was in fashion from the 1st century B.C. up to the Flavian period and then again from the 4th century on. However, a glance at the dating of some of the hundreds of extant pavements will reveal the error of this opinion. To the long list given under *Inkrustation* in the *RE* may be added a large group of Early Christian churches in Rome — from S. Adriano to S. Stefano Rotondo, from S. Lucia in Selci to the Lateran Baptistery, and from S. Giorgio in Velabro to S. Costanza and S. Agnese — as well as the pavements in Via Capo d'Africa and in the Curia of Diocletian in the Roman Forum; that of the Serapeum at Leptis Magna; in Constantinople, the pavement of St. John in Studion and fragmentary examples in the imperial palace; and the flooring of the episcopal chapel at Ravenna (Oratorio di S. Andrea), of St. Gabriel at Kos, of a Roman villa at Beth Guvrin in Israel, and others.

There are also examples of *opus sectile* that are representational. Dating from the 3d century are a beautiful, delicate head of Helios from the Mithraeum under S. Prisca in Rome and a panel with a griffin, found in the vicinity of S. Pietro in Vincoli, now both in the Museo Nazionale Romano. Assigned to the 4th century (although perhaps to be dated later) are the inlays of the Basilica of Junius Bassus; these were executed by two different artists, since the representations of the tigers attacking a deer and a calf (PL. 79) and of the quadriga may be attributed to an artist of African background, and the little picture of Hylas surrounded by nymphs to a second artist of Hellenic bent. To the end of the 4th century or the beginning of the 5th are assigned the poorer, cruder examples, depicting sheep, in S. Ambrogio in Milan, and to the 5th and 6th centuries the inlays of many basilicas, such as S. Sabina in Rome, the

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

Basilica Eufrasiana in Parenzo (PL. 81), St. Demetrius in Salonika, and St. Sophia in Constantinople, all with motifs of liturgical significance, with chalices, dolphins, and aediculae. Also late in date is the splendid revetment of a room in a house at Ostia, with figural as well as geometric inlay.

Finally, note should be made of some inlaid work of special interest. One group consists of designs obtained with inlays of brick that are monochromatic, or, if differently baked bricks are used, at most dichromatic. These inlays appear especially throughout the 2d century, generally in a funerary context; there are examples in the necropolis of Ostia on the Isola Sacra and in the cemetery found beneath St. Peter's in Rome. Another group is made up of obsidian bowls found at Castellammare di Stabia; in these enamels small pseudo-Egyptian scenes, animals, and floral motifs are inserted, together with gold filigree, into the surface cavities (PL. 78). Clearly this work is from the beginning of the Christian Era, and the Alexandrian provenance of these precious little vessels is beyond question. A third and final example is the door "inlaid with marble slabs" mentioned by Eusebius (*De vita Constantini*, iii, 36), some idea of which may be had from a mosaic of Souzy-la-Briche (*Inventaire des mosaïques de la Gaule*, I, 924) that seems to picture precisely the wings of a double door, covered with *crustae* of multicolored marble.

Michelangelo CAGIANO DE AZEVEDO

THE EUROPEAN WEST. The architectural use of inlay of marbles and varicolored stones goes back to antiquity. The late-antique tradition was continued in Ravenna (S. Vitale, I, PL. 411; Baptistery of the Orthodox), and, more in the Western style, in the work of the Cosmati (q.v.), and in the decoration of Tuscan Romanesque buildings in Florence (Baptistery, I, PL. 302; S. Miniato; the Badia in Fiesole, III, PL. 388; and Alberti's shrine of the Holy Sepulcher, I, PL. 50, and his façade for S. Maria Novella, I, PL. 53). In richer, more detailed form the late-antique tradition was continued in Pisa, Lucca, Venice, and Pistoia. This kind of mural decoration fulfilled the desire for pictorial and decorative effects that was characteristic of both the Romanesque and the Gothic and which gave way to a more rigorously geometric and perspectival style during the Renaissance. Inlay of this type, found on ambos, baptismal fonts, and the like, was most widely used in Campania, in Latium, and in some periods in Tuscany.

Another unusual production of 14th-century and Renaissance Italy was what Vasari called "another kind of mosaic, made of marble fragments so joined together that they imitate subjects depicted in chiaroscuro" (Introduction to *The Lives*). He said it was found on pavements and even on the façades of buildings. Among the most famous examples are the pavements of the Baptistery of Florence (PL. 82) and of the Cathedral of Siena; the Siena pavement, which Vasari dated to the time of Duccio (it was actually begun in 1372), was the work of many 15th-century masters, among them Matteo di Giovanni and, at the beginning of the 16th century, of Beccafumi (PL. 86). Francesco di Giorgio (q.v.) prepared the cartoon for another "storied" pavement, that of the chapel of St. Catherine in S. Domenico in Siena. In all these works a black substance based on pitch was placed in the hollows prepared for it on slabs of marble. The pattern of black and white which resulted is particularly effective. Great compositions of exceptional power unfold beneath the feet of the spectator. Less striking is the effect of intarsiated pavements in Rome (Sala della Giustizia in Castel Sant'Angelo) and Florence (Laurentian Library, the pavement of which Vasari called a masterpiece of its kind).

In the baroque, the use of inlay in architecture was revived, and the polychromy of marble was exploited. Borromini's Cappella Spada in S. Girolamo della Carità in Rome is a masterpiece (II, PL. 313). The incrustation of tombs, altars, pulpits, and ciboria extended even to the addition of precious stones. In the 18th century, however, the art of marble inlay slowly declined.

Wood intarsia is even richer than marble inlay and was employed from the 14th century on. Boxes, coffers, and wooden objects had been generally covered with stucco or painted; the use of wood without such coating was something new and required the work of inlayers (*intarsiatori*) skilled in cutting thin pieces and in varying the colors by combining different types of woods, such as ebony, cypress, boxwood, and walnut. Initially the inlayers took special advantage of light woods (the spindle tree and boxwood) and dark (ebony and walnut) for contrast, but at the end of the 15th century they resorted to staining. Shadings were obtained by blackening the wood with a hot iron after the pieces had been glued on. The discovery of a procedure that permitted staining the wood by boiling was attributed by Vasari to Fra Giovanni da Verona (V, PL. 440), who supposedly used it in the choir of the abbey church at Monte Oliveto Maggiore, near Siena, in 1503. Actually credit belongs to Lorenzo and Cristoforo da Lendinara, who had already employed the technique as early as 1462 for the panels of the choir stalls in the basilica of S. Antonio at Padua.

Intarsia certosina work, in which small polygonal tesserae of wood, bone, ivory (see IVORY AND BONE CARVING), or mother-of-pearl are arranged in geometric forms, was in use up to the 15th century, especially in Lombardy and in the Veneto. For coffers, small caskets, and sacred furnishings, sculptural decoration was combined with this type of inlay.

Intarsia was first widely used in Siena. The names of masters famous in this field are known from the 14th century on. Some of their works have been preserved, such as the choir stalls of the Orvieto Cathedral, depicting figures of saints framed by rosettes and geometrical motifs (PL. 85), executed by the Sienese Giovanni Ammannati and his school. At the beginning of the 14th century, Domenico di Niccolò dei Cori made for the stalls of the chapel in the Palazzo Pubblico in Siena a series of panels illustrating the articles of the Credo. The panels seem to be literal renderings of paintings. His pupil, Mattia di Nanni, called Bernacchino, received between 1425 and 1430 numerous commissions for the Palazzo Pubblico, among them one for a *residenza*, or large backed chest-bench, adorned, it is believed, with five tondi, now lost, showing figures of famous men, and with two allegorical scenes. The latter have survived. One of these is a view of Siena, certainly inspired by some painting and recalling the ideal cities seen in medieval miniatures.

In the second half of the 15th century the development of the art of intarsia changed direction completely. It became linked to the researches of the Florentines, who were investigating a new definition of forms in space in terms of perspective. The discipline received decisive impetus during 1425–35 from the perspective demonstrations of Brunelleschi and Alberti. The starting point of these studies in perspective were city views in which the regular diminution of side walls, similar to that of theater wings, and the recession of paving stones was easily translated into linear forms. The intersection of vanishing lines and orthogonals established a network of simple shapes easily rendered in cutting wooden laminae. The urban perspectives were not only a favorite exercise of the intarsia workers but a clarification of the very reason for the existence of their art. The masters of perspective were both *prospettivisti* and *intarsiatori*. The 1492 inventory of Lorenzo the Magnificent lists in the great salon of the Palazzo Medici "a wooden bedstead of five and a half *bracce* with inlays and perspectives." There are extant several examples of *cassoni* ornamented with panels of this kind (Florence, Contini Bonacossi Coll.). This intarsia decoration with scenes of architecture in perspective, set in carved frames and used in coffers and chair backs, can be compared to the painted city views (in Baltimore, Walters Art Gall.; Berlin, Staat. Mus.; Urbino, Gall. Naz. delle Marche) that clearly derive from them. Another favorite field for intarsia was the geometry of solids. Paolo Uccello's studies of the structure of three-dimensional forms were intended, according to Vasari, to furnish *intarsiatori* with new and ingenious models, such as polyhedrons, books, and stars. From such exercises it is a short step to trompe-l'oeil and still life.

No works survive of the generation that could have profited directly from the instruction of Brunelleschi, but the names of many masters are known, especially those who worked under Antonio di Manetto on the cupboards of the sacristy of the

Cathedral of Florence. Among them was the brother of Masaccio, Giovanni Guidi, called Scheggia. But the redecoration by Giuliano da Maiano resulted in the disappearance of almost the entire work of his predecessors except, perhaps, for the upper part of the panel to the right, decorated with garlands set against a background in perspective. The intarsia by the Maiano brothers in the sacristy of Florence Cathedral explains their fame. In bringing up to date Manetto's scheme of decoration, the Maianos placed large figures in niches and scenes from the Gospels inside a vigorously architectonic framework (PL. 83). Vasari described Benedetto da Maiano's talent in the art of "combining woods stained different colors to produce perspectives, rinceaux, and other objects of fancy, introduced in the days of Filippo Brunelleschi and Paolo Uccello" (*Life of the Maiano*). The renown achieved by Benedetto brought him an invitation to Naples from Alfonso of Aragon and to Hungary from Matthias Corvinus.

The golden age of Florentine intarsia was about 1460–70. The chronicler Benedetto Dei counted at that period 84 intarsia workshops in the city. The most famous of these, after that of Benedetto da Maiano, was run by Francesco di Giovanni (called Francione), noted in Pisa after 1467 and said by Vasari to be the master of Giuliano da Sangallo. It was to a Florentine, Baccio Pontelli, that the Duke of Urbino turned for the decoration of his study. In 1475 Pontelli executed for that study a celebrated piece of decoration in trompe-l'oeil in which all three types of decorative intarsia are used: imaginary cabinets on the wall, false niches with figures, and an imaginary window (PL. 100). A view through a portico with double-storied pilasters, opening onto a landscape of lakes and mountains, suggests the author of the cartoon: Francesco di Giorgio, then in the employ of the Duke of Urbino, certainly furnished the design for this composition (PL. 80). Some years later, in Gubbio, the city from which the Montefeltros, dukes of Urbino, originated, there was executed another *studiolo* (New York, Met. Mus.), inspired by the Urbino decoration, that reached a level of matchless virtuosity. The finest example of intarsia, by then a complex and sophisticated art, was executed in Siena between 1482 and 1502 by Antonio Barili: the choir stalls of the Chapel of St. John the Baptist, featuring bust-length figures and landscape elements. Six panels are at San Quirico d'Orcia.

In northern Italy, the work of Piero della Francesca, artist-mathematician par excellence, was at the root of wood inlay decoration in the new style. Piero himself influenced the brothers Lorenzo and Cristoforo da Lendinara (PL. 86) and, through them, others. By contrast with their abstract, decorative work in the Modena Cathedral (1461 on), the brothers revealed in their compositions for the choir of the basilica of S. Antonio in Padua a less rigidly linear and more pictorial style. The technique of boiling wood to alter its color furnished more varied, gradated tones and made possible subtler light effects. Miniature arcades with alternating dark and light voussoirs frame views of a city with bridges, balconies, towers, and porticoes — an atmospheric portrait of Padua. The Lendinara brothers trained many pupils north of the Appennines. One pupil, Pier Antonio dell'Abate, son-in-law of Lorenzo, executed in about 1484 a series of choir stalls (for S. Corona in Vicenza), alternating still lifes with architectural perspectives in a style very close to that of the intarsia in Padua, on which he had probably collaborated. A similar development took place in Lombardy, which produced such noteworthy items as the cupboards of the sacristy of S. Maria delle Grazie in Milan, the stalls of the Certosa of Pavia (on which Bartolomeo da Modena worked from 1487, followed by Pantaleone dei Marchi, also from Modena), and the wooden aedicula, called the *coretto*, at Torrechiara in Tuscany, of which there is another example in the Victoria and Albert Museum, London (V, PL. 440).

Inlay combining still life and architectural perspective found its most splendid exponent in Fra Giovanni da Verona. Giovanni's teacher was certainly Fra Sebastiano da Rovigno, an Olivetan oblate with whom he was in Ferrara in 1477 and 1478. For the Convento di S. Elena in Venice Fra Sebastiano inlaid 34 stalls, a work that brought him considerable fame. They are now in the sacristy of S. Marco. Fra Giovanni probably collaborated on the work, since he was in Venice in 1489 and 1490, just when his master was engaged in this important task. Doubtless, Giovanni mastered all the many possibilities that the cityscape offered to intarsia decoration, for he was able to develop this theme in his work for the choir of S. Maria in Organo, Verona (1492–99), revealing both technical ability and a fine poetic imagination. For the choir at Monte Oliveto Maggiore he executed 52 panels in two years (1503–05); only a fraction of the original number remain in place, 38 of them now being located in the Siena Cathedral. These panels exhibit extraordinary richness of invention: there are landscapes traversed by swallows in flight; perspective views with pheasants, cats, hoopoes, and other animals; fantastic architecture; and views of Monte Oliveto, Siena, and the Colosseum.

Fra Giovanni da Verona was called to Rome and commissioned by Julius II to decorate with intarsia the Stanza della Segnatura in the Vatican, a project he worked on from 1511 to 1513. But his work was removed during the pontificate of Paul III to make room for the monochrome paintings of Perino del Vaga, an occurrence that indicates an important change in taste and signals the end of the golden age of intarsia. The Florentine tradition of measure and elegance had lost its meaning for *intarsiatori* like Giovanni Francesco Capodiferro, who for the Cathedral of Bergamo used cartoons by Lorenzo Lotto to execute panels of extraordinary virtuosity but overloaded with motifs and without any formal unity (1524–30). This break with tradition is seen also in the work of Damiano Zambelli da Bergamo, another pupil of the famous Fra Sebastiano. In S. Bartolomeo in Bergamo, his native city, Damiano placed among Biblical scenes a view of Brescia, a view of the Piazza Vecchia in Bergamo, and a "Venetian" perspective, all of them retaining an echo of his master's style. But his masterpiece is the series of episodes from the lives of the saints that adorns the choir stalls of S. Domenico, Bologna (1528–40). For Fra Damiano city views were no longer inanimate descriptive motifs, bereft of people, but settings for scenes full of animation. This new tendency was continued by Fra Damiano's favorite pupil, Francesco Zambelli, who put together for the church of S. Lorenzo in Genoa a series of panels from which architecture disappears, giving place to landscape and figures. Still working in the old manner, in Tuscany the brothers Nicolò and Ambrogio Pucci composed in 1529 panels with "synthetic" city views set in half-open cupboards (now in Lucca, Pin. Naz. di Pal. Ducale).

As intarsia developed into "a new kind of painting" — that is, only a faithful transcription of the work of contemporary artists — it lost its essential character and, simultaneously, its decorative effectiveness. Inlay finally became a mere ornamental adjunct to coffers, tables, and pieces of cabinetwork.

But just when it lost its vigor in Italy, the technique of wood inlay came into favor and underwent interesting developments in southern Germany. Augsburg in particular became a center of production notable for both quantity and quality. One example stands out, the so-called "Wrangel Cabinet," 1569, now in the Kestner-Museum, Hanover. It is a cabinet whose doors are adorned with panels: ruins, geometrical solids, the most fanciful ornaments, fallen columns, swollen classical drapery, torsoes, busts, fantastic horses, broken vases, volutes and cylinders, perforated and cut forms comprise quaint scenes that are made more prominent by the coloration of the woods. This work is a triumph of cartouche design and of mannerist decoration.

Another kind of furniture inlay, featuring the use of rare marbles, began to be developed in Italy in the middle of the 16th century. The table designed by Giacomo Barozzi da Vignola (ca. 1570; New York, Met. Mus.; PL. 84) presents a surface of white marble incrusted with colored marbles and rare stones (*opus compaginatorum* set in geometric and heraldic motifs. It was the intention of the makers of these *tavole intarsiate* to model themselves on the splendor of the antique, and in fact Roman marbles were generally used. *Tavolini di gioie*, inlaid with precious stones, were also produced; Vasari mentioned in this regard Bernardino di Profirio of Leccio, the head of

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

a particularly active Florentine workshop. This manufacture of luxury items came to be appreciated even outside Italy because of the gifts which the Medici made to foreign rulers. In the 17th century a rather large number of these objects were produced in a special workshop of the Medici Grand Dukes, known as the *Opificio delle pietre dure*. Colbert even sent for an Italian expert, Ferdinando Migliori, for the Gobelin manufactory to teach the French this technique.

But French marquetry, as used in cabinetwork, underwent a completely new development, partly because of the range of materials employed, varicolored and often precious — ivory, mother-of-pearl, tortoise shell, in combination with metal and wood. The tendency to render the panels more splendid emerged in the 16th century with the use of arabesques, but it was developed only with the so-called "mazarine" desks, on which there began to appear surfaces of violet wood with insets of tin or edgings of ebony, or even with inlays of red tortoise shell framed in copper. The small chests and cabinets made by André Charles Boulle (1642–1732; V, PL. 444), almost exclusively for Louis XIV, are the complex masterpieces of this sumptuous art, which was continued into the 18th century (PL. 87) by such Parisian cabinetmakers as Jean Henri Riesener (V, PL. 454), Jean François Leleu, and François Oeben (see FURNITURE). In woods there was a very wide range of choice: rosewood and violet wood, palisander and mahogany, as well as boxwood and olive. In forms, geometric ornament gave way to garlands, to baskets of flowers, and to "silhouettes" of pastoral subjects. Imitated in almost all Europe, this art of the great Parisian cabinetmakers and inlayers inspired, in Germany, the compositions of Abraham and David Roentgen, and, in Italy, the incrustation of Pietro Piffetti in Turin. Piffetti, from 1731 cabinetmaker to the King of Sardinia, inlaid furniture of precious woods with gold, ivory, and mother-of-pearl; the Queen's study in the Royal Palace in Turin contains fine examples of his art. The work of Giuseppe Maggiolini in Milan came somewhat later (V, PL. 451). Maggiolini, a protegé of the Archduke Ferdinand, decorated the Royal Palace (then being restored by Giuseppe Piermarini) with inlays that marked the passage from a rococo to a neoclassical style of ornamentation.

André CHASTEL

THE EAST. In China inlaying lacquer with mother-of-pearl seems to date back at least to the T'ang period (V, PL. 459). One of the earliest examples extant is a lute in the Shōsōin repository in Nara (PL. 90). In Japan, from the time of the Nara period, this type of inlay was very common, especially in combination with gold or black lacquer sprinkled with gold, and was used for boxes (*suzuri-hako*, *inrō*, and the like). Great masters of Japanese painting, such as Ogata Kōrin (q.v.) and Hon-ami Kōetsu, made use of inlay in the decoration of large, multipartite screens of painted lacquer. Save for one period — under the Ch'ing dynasty, in which screens of Coromandel lacquer inlaid with jade and other semiprecious stones were produced — the art of inlay soon fell into disuse in China.

The Moslems seem to have inherited the inlay technique from the Copts and from Sassanian Mesopotamia. They used it mainly for bronze, wood, and ivory work (V, PL. 458). Silver inlay on bronze flourished especially under the Seljuks, Ortuqids, Ayyubids, and Mamelukes in Persia, Iraq, Syria, and Egypt, some preferring a semiheraldic figural style, others geometrical and arabesque decoration. Among these objects are some of the greatest masterpieces of Islamic art. Later, silver or gold inlay on iron and blackened steel became more common, especially in Iran. An Indian variety is the biddery ware and Moradabad ware, probably developed in the 15th century but known mainly from 17th-, 18th-, and 19th-century hookahs, bowls, ewers, and dishes in the Moghul taste. Inlay (of various woods, ivory, bronze, or mother-of-pearl) in wood was common, though mainly combined with woodcarving, appliqué, and mosaic work. The transition between media is almost indistinguishable.

Least known is the East Persian (predominantly Timurid) school; somewhat better known is the Anatolian-Seljuk type, represented mainly at Konya; and best known is the school of Cairo. This type of inlay is found especially on the doors, ceilings, and mimbars (pulpits) of Mameluke mosques and madrasahs in Egypt and Syria (al-Mu'ayyad, PL. 88; Ḥasan al-Kabir; 'Abd-al-Gharī Fakhrī) and in Istanbul (in the Sulaymāniya), where they had been imported. Very few of the smaller pieces have survived. A wooden casket inlaid with ivory figures, inscriptions, and arabesques (12th or 13th cent.) is preserved in the Royal Palace in Palermo, and some Indian travel chests of sandalwood, inlaid with ivory figures in a mixed Rajput and Deccan style, are in the Victoria and Albert Museum, London.

One of the most impressive forms of Indo-Moslem inlay work is that of semiprecious stones, or, more simply, of black marble in the white marble buildings of the Moghul emperor Shah Jahān (1628–58). Though in form it is a variety of the mosaic work in variously colored marbles, limestone, and schist in use under Shah Jahān's predecessors, Shēr Shah, Akbar, and Jahāngīr (16th–early 17th cent.), this type of inlay appears technically to be an adaptation of Florentine "mosaic" introduced by Italian and French adventurers. The change in technique occurred because the elements of the new designs were distributed much more sparsely over the white marble ground and because of the costliness of the stones inlaid (agate, carnelian, malachite, and others, generally no more than a quarter of an inch thick). Accompanied still by older modes of decoration in mosaic and relief, this new type of inlay appeared first in the mausoleum of I'timād-ud-Daula at Agra (1628; PL. 89). It predominates, however, in the decoration of the palaces of Shah Jahān at Agra, Delhi, and the Fort at Lahore, and in the Tāj Mahal. With the decline of the Moghul empire under Aurangzēb (1658–1707), this inlay work was gradually replaced by painting on marble and ultimately by painting on stucco designed to imitate marble.

The Jāt rajas of Bharatpur reused Moghul inlaid marble slabs for their garden palaces at Dig, and the maharaja Ranjit Singh of Lahore used slabs from the tomb of the empress Nūr Jahān for the Golden Temple of Amritsar.

Inlay has to some extent been used by the Jains in the decoration of their temples. The craft survives in the bazaar at Agra.

Hermann GOETZ

TRIBAL CULTURES. Inlay, as decoration applied to surfaces especially prepared for it, is not found among primitive peoples. Almost universally used, however, are insertions (of eyes, teeth, and so forth) in wooden figures, as well as appliqués — in designs that are mostly geometric, rarely figural — of pieces of mother-of-pearl and other material on the surfaces of vases, furnishings, cult objects, and weapons. Appliqué (see MEDIA, COMPOSITE) predominates particularly in Oceania, where, in the Solomon Islands (see MELANESIAN CULTURES), it reaches its highest level of artistic quality in the display shields of the island of Guadalcanal. Singularly pleasing effects are produced on these shields by the application on a ground covered with a resinous preparation of pieces of shell arranged in designs that are abstract, yet derived from the human figure. Equally effective are the appliqués of mother-of-pearl on the ceremonial vases and wooden arms of the Palau Islands (see MICRONESIAN CULTURES).

Inlay is not found among the cultures of pre-Columbian America; these civilizations produced, instead, works in the mosaic technique (see MOSAICS).

INNESS, GEORGE. American painter (b. near Newburgh, N.Y., May 1, 1825; d. Bridge-of-Allan, Scotland, Aug. 3, 1894). Son of a prosperous merchant, he grew up in Newark, N.J. Because of delicate health he received little formal education. Except for brief study with the French-born landscapist Régis Gignoux in New York, he was self-taught, painting landscapes directly from nature. His early work, in the prevailing meticulous Hudson River school style, did not satisfy him; he later said that his eyes were opened by engravings after the old masters; "they were nature, rendered grand instead of being belittled." This revelation was confirmed by two early visits to Italy, in 1847 and 1850–52, and another to France, where, in 1854, he saw the work of the Barbizon painters. While retaining his native fidelity to facts, from the mid-1850s Inness evolved a more subjective romantic style: the panoramic viewpoint gave way to an intimate one, literalism to growing awareness of light, atmosphere, and mood. His style became broader, freer, more chromatic, and more painterly. This evolution was further stimulated by a four-year European visit (1870–74), with winters in Rome and summers in the Italian countryside and at Etretat in France.

In 1850 Inness married Elizabeth Hoyt; they had six children. For years he received little recognition except from a few patrons. Elected Associate of the National Academy of Design in 1853, he was not made full Academician until 1868. The family led a somewhat nomadic existence, living in Brooklyn and New York, 1854–59; Medfield, Mass., 1859–64; Eagleswood, N.J., 1865–67; Brooklyn, 1867–70; New York, 1875–78. From the mid-1870s his fortunes improved. In 1878 he settled in Montclair, N.J., his permanent home thereafter, with painting trips to Virginia, California, Florida, and elsewhere.

Inness' mind was restless and inquiring. Strongly religious, he was converted in the 1860s to Swedenborgianism. For a time he painted religious subjects, and to him even pure landscape was an embodiment of the divine: "All things that we see will convey the sentiment of the highest art if we are in the love of God."

As he matured, he became concerned less with the objective facts of nature than with her moods and the subjective emotions they aroused (I, PL. 109). More and more he saw everything in terms of light, color, and tonal values. This development came largely from within, but it was assisted by the Barbizon example. In his latest phase the Barbizon viewpoint evolved into a dark, romantic tonalism suggestive of impressionism. Inness' emotionalism occasionally verged on sentimentality; while his emotional content was often fresh and moving, it was also sometimes banal. Nevertheless, he remains the most vital American romantic landscapist of his period and the one who had the strongest influence on the native landscape school.

Inness' paintings are in most American museums, with large groups in the Metropolitan Museum and the Art Institute of Chicago.

INSTITUTES AND ASSOCIATIONS. Corporate institutions connected with the world of artists and art lovers have been created in many varying forms depending on their origin, their nature, and the demands (technical, economic, didactic, scholarly) they were organized to meet. Clearly, such organizations as simple trade associations or artists' and craftsmen's workshops differ greatly in character and purpose from schools and academies of art, societies of art lovers, and those modern institutions devoted to research and study in the field of art history. Still, for all their differences, these forms of artistic cooperation and organization are to some degree interdependent and often have historical links, so that it is far from easy to establish any clear-cut line of demarcation which would justify treating them under more than one heading. Each period of history has, in fact, its own forms, reflecting the standards and structure of the civilization from which they spring. In ancient times and during the Middle Ages, the typical form of association was the workshop or corporation, in which, side by side with the predominant practical purpose, are seen elements of a religious, social, or cultural nature. A great part was played by these institutions in the handing down of artistic experience. From the 16th to the 19th century the academies of art in various parts of Europe, acting with official support, worked to establish a system based on experience and to codify rules, while at the same time they encouraged a certain amount of study and reflection on artistic matters. It is only in recent times that these various activities have been differentiated and incorporated in separate bodies, resulting in modern societies of artists, schools of art, cultural societies, and institutes devoted to study and research. The rise of the latter type of institution as a means of increasing knowledge of the historical basis of problems connected with art is directly related to the predominant historicist tendencies of modern thought and culture. For closely related subject matter which amplifies and completes this discussion, see CRITICISM; EDUCATION AND ART TEACHING; HANDICRAFTS; HISTORIOGRAPHY; MUSEUMS AND COLLECTIONS; PRESERVATION AND CONSERVATION OF ART WORKS; SOCIOLOGY OF ART.

ORGANIZATION OF ARTISTIC AND CRAFT ACTIVITIES IN PRIMITIVE SOCIETIES AND IN THE ANCIENT WORLD. It is impossible to picture accurately for remote, and even not so remote, periods of prehistory, the forms of collective cooperation in the execution of a work of art. The existence of such cooperation, at least in the technical sphere, is probably implicit in the scale of prehistoric rock decoration, in the sum of the experiences handed down through the ages, and in the continual use of schemes that presuppose some degree of specialization and education of artists; but it is impossible to establish how and to what extent this activity can be distinguished from that of groups composed of members of a family or from the realm of magic and religion. Certainly the craft of the stonecarvers and of the modelers in clay, with all its formal and decorative implications, must have had an enduring organizational structure of schools and workshops. On the other hand, in the art of pottery, one cannot ignore the indications that from Neolithic times this art was a feminine occupation carried on within the family unit. Only beginning with the more complex art of metallurgy can one speak with some certainty of embryonic specialized corporations, stable or wandering. Some light is thrown on this primitive world by the traditions and testimony of the organized societies of ancient times as revealed in the earliest written evidence, with its echoes of a legendary past; more informative, however, is the situation among primitive peoples of the present day or of the historical past.

In primitive communities groups of individuals often form special classes or castes bound by racial, religious, or political ties to the practice of certain crafts handed down from father to son. In West Africa the various crafts were almost everywhere in the hands of castes, often despised and also feared for the magic powers with which they were credited, but sometimes held in high esteem, as among the Akan group, where metalworkers and smiths possessed clearly defined social functions. In the same area, among the Ashanti of Ghana, the goldsmiths formed a sort of brotherhood in which the secrets of the trade were handed down from father to son.

In pre-Columbian America corporations of craftsmen existed among the Aztecs, but chronicles provide information only about the most active — the goldsmiths, the mosaicists, and the jewelers. These craftsmen were known as Toltecs because their artistic activities were regarded as something foreign to Aztec culture, a legacy inherited from the preceding Toltec civilization. This attribution is not purely legendary. After the fall of Tula, capital of the Toltecs, the population dispersed throughout the Valley of Mexico and continued to follow its own way of life, preserving its native techniques and artistic skills. According to Jacques Soustelle (*La vie quotidienne des Aztèques à la veille de la conquête espagnole*, Paris, 1955), the group of craftsmen responsible for the production of feather mosaics, prior to the incorporation of their village (Amatlán) and themselves into the Aztec capital and civilization, had been enemies, foreigners to be conquered. Even after their assimilation they continued to follow their own customs, remaining faithful to their group tradition and pledging their children to the tutelary gods of the guild for the continuance of their craft.

In Polynesia and Micronesia there were schools for the art of tattooing, and the great masters (called in Samoa *tufuga ta tatau*) were held in the highest esteem. Often their fame extended beyond the island or archipelago in which they practiced their art. In western Polynesia, for example, the school of Samoa was so famous that the young men of the Tonga Islands undertook long sea voyages in order to be tattooed there.

Conditions of this sort probably existed in the world of European and Eurasian protohistory. Many indications of this could be cited relating to the origins of the metallurgic cultures of central and western Asia, to the vast areas covered by the ancient steppe cultures, and to the European Iron Age.

Concerning prehistoric and protohistoric China there is additional material, derived from the analysis and sociological interpretation of literary documents of a later period. From these it is clear that groups of technicians and craftsmen, expert in the production of pottery and the fusion of metal, had from a very early date formed themselves into confraternities whose leaders, according to some scholars (Marcel Granet), even possessed political power. Legends concerning mythical rulers and heroes (Huang-ti, the great Yü) speak of associations of potters and bronzesmiths consisting, for the most part, of 72 or 81 members. The bronze caldrons and magic swords which they made became royal or dynastic symbols. Other legends of a somewhat later date reveal how the swordmakers received the secrets of their trade from a master or relative; clans of such founders of metal probably existed, especially in those regions of southern China that in the Chou dynasty saw the beginnings of the art of metallurgy.

Similar traditions persist in the mythology of the ancient peoples of the Western world. These traditions record the names not only of individual craftsmen, masters, and magicians like Daedalus, whose teachings, techniques, and "shop secrets" were passed on and spread over the course of time, but also of groups like the Cyclopes and Cabiri, sharing not so much an ethnic kinship as the secret of a special manual activity which they carried on with unique skill. Such myths and traditions seem to be an allusion to the origins of distinctive craft categories and workshops.

Written sources show more concretely that individual craftsmen took charge of important projects. In this category are Bezaleel, who directed the building of the Tabernacle in the Holy Land; Hiram, whose versatility in the arts led to his being put in charge of the construction of the Temple of Solomon; and the anonymous craftsman who made the throne of Solomon, which was subsequently copied or carried off by Nebuchadnezzar to Babylon. There were those craftsmen who worked on the temples of Mesopotamia, such as that of Khafaje, somewhat in the manner of the craftsmen engaged in building a medieval cathedral. In return for their services and the use of their particular skills, they were provided with the means of subsistence and the materials necessary for their work. Some form of association with a hierarchic structure seems to have existed at the Egyptian court, where such posts as Master of the King's Works and Superintendent of the Palace sometimes apparently were hereditary. Several classes of craftsmen, who probably formed corporate associations of some kind, are mentioned in the Code of Hammurabi. They were not protected by official regulations, however, and had a private character based on paternal instruction within the unit of the individual workshop. More highly developed was the form of association documented in the 15th and 14th centuries B.C. at Ugarit, where types of corporations existed with practical aims of a commercial nature and safeguards and privileges for members. The terms used to designate master and apprentice differ from the habitual "father" and "son," a fact which suggests that there the usual custom of handing down crafts from one generation to another of the same family was not practiced. At about the same time, according to recent interpretations of the tablets from Pylos (though the evidence is not entirely reliable), there seem to have been groups of craftsmen of various sorts, especially metalworkers, operating in the local courts of the Aegean area.

Archaeological evidence confirms this. At Tell el 'Amarna have been discovered the living quarters and working area of the workmen and craftsmen engaged in building the city. This temporary "city" has a hierarchic structure which seems intended to ensure its smooth working. Besides this unified structure, the existence of wooden models composed of separate parts, each of which seems to have been mass-produced, also indicates the presence of some sort of loose form of association between related workshops. Finally — and this is particularly important for the protohistory of the Iranian plateau — while in techniques and types of pottery even the smallest

UP State Museum, Lucknow

localities show notable individuality, the areas of diffusion of certain types of bronzes are clearly much larger and more uniform. Information about wandering communities of craftsmen, some of which still survive (tinkers, gypsies), sheds light on the diffusion routes of cultural currents, particularly in connection with such highly composite cultures as the Neo-Assyrian, the Urartu, the Achaemenid, and the Celtic, in all of which are seen the influence of the Scythian migrations. The problem of metalworking is vital and significant. The discovery of a foundry in the palace at Phaistos and at Knossos (where there are also ceramic workshops), together with lists of objects produced and stored in the palace at Pylos, should be taken in conjunction with what is found in the world of the Homeric poems, which reflect the usages of the preceding civilization. The production of everyday objects was carried out in the family unit under the direct control of the head of the family, while objects requiring a difficult, refined, or specialized technique were bought or commissioned from wandering artists who enjoyed the protection of the law of hospitality. Not only the artists but also metal, their raw material, traveled. This is proved by the discovery in Sardinia of pigs of bronze bearing Cretan markings, and by the cargo of a Bronze Age ship, which foundered south of Cape Gelidonya, between Finike and Antalya, off the coast of Asia Minor, with a cargo of metal ingots and pigs (G. F. Bass and P. Throckmorton, "Excavating a Bronze Age Shipwreck," *Archaeology*, XIV, 1961, p. 78 ff.).

As for ceramic workshops, those of high standard were clearly not mobile, especially in ancient and classical Greece. The hereditary principle seems to have been widely abandoned, and the successful painter often opened his own workshop. Excluded from citizenship in aristocratic regimes, and accepted only with limitations in timocracies, such was the weight of the traditional disrepute in which artists were held that even after achieving full equality of rights under the democratic constitution of Athens, they tended at the first opportunity to become entrepreneurs. Phidias himself illustrates this tendency.

One form of temporary association of this period was the large group of artists and craftsmen which gathered together to build works commissioned by various cities. In most cases, however, these acts of civic patronage lacked the conscious purpose of a Pericles, whose appreciation of the propaganda value of good art, and of the contribution which his building program could make to artistic standards and organization, remained exceptional. Even in Hellenistic times, all the artists at Sparta were state slaves or foreigners, and this situation was repeated in Crete and Tanagra. A provision to this effect is contained in the constitutional proposals of Phaleas of Chalcedon.

The Hellenistic period was characterized by an intimate association between artist and prince. More important than the friendship and protection of the prince, who was himself often a person of artistic interests and culture, was the existence under his patronage of groups interested in art and in critical and literary problems — real academies, in fact, whose members had a common interest in the definition and stylistic resolution of certain problems. This is the highest point reached in the organization of artistic culture in antiquity. Not until Roman times were there real collegiate associations of artists, and even then such associations were conceived of from a utilitarian, "trade-union" point of view. In Rome itself the practice of an art was originally considered unworthy of an *ingenuus*, that is, a freeborn man. This explains why until the late Empire there were neither artistic organizations for such men nor any significant number of people devoting themselves to the arts, except for certain famous individuals whose interest was pure dilettantism (Fabius Pictor, Quintus Pedius, Nero, Hadrian, Marcus Aurelius, Alexander Severus, Valentinian I); even such persons as these were sometimes the object of criticism (Attalus III, Heliogabalus). The only exception was the instruction in painting (that is, design) given within the family to enable women to select or execute embroidery.

Alexander Severus set up a school of architecture with an ambitious program and a theoretical basis. This school was open to *ingenui*. Later state interventions in this school and provisions to encourage artistic teaching within the family were emergency measures of a purely practical nature designed to meet the shortage of artists and the decline in technical standards. Architecture remained always the favored art. Under Constantine a grant (*stipendium*) was decreed for students of architecture, while those who acquired and passed on to their children any technical skill ancillary to architecture were granted certain tax concessions. Painters received similar favors under Valentinian I, being exempted from some tax burdens and granted the free use of state-owned studios (*pergulae*) and workshops.

The first workshops were organized on a strictly family basis, instruction being given by the paterfamilias to his children and to the slaves attached to the workshop. The development which took place between the late republican period and the end of the Empire brought with it an increase in the activities, and thus in the personnel, of the workshops, which came to be associated with a whole *gens* rather than an individual family; with their monopolistic privileges based on imperial concessions and benefits, they provided a fruitful source of revenue. In this way these workshops existed for many decades and were the centers at which whole generations of craftsmen were trained. Their activities were, or soon became, industrial in nature: a typical example is the production of Arretine ware, which imitated the example of the earlier factories of Megarian, Pergamene, and Etrusco-Campanian ware in its type of organization. The first names of proprietors to appear in the makers' stamps were all Italic, but the craftsmen were Greek or Oriental. One might perhaps mention here the existence of monopolies, often granted to members of the imperial family, in certain other nonartistic fields of production, such as the manufacture of lead pipes and bricks.

One incentive to artistic production was the life of the legions, which was reflected both in the execution of works of military interest (for which there were specialized craftsmen) and in the production of reliefs, mainly funerary. These were often carried out by Romanized barbarian artists working on the spot.

The new social structure that emerged at the end of the 3d century of our era, together with the tendency toward a closed economy, encouraged the development of the self-sufficient workshop run directly by the owner and intended to serve a limited area. Its activity did not normally include work of high artistic quality, for which outside artists were engaged. In the great houses, and particularly the imperial household, there were true examples of specialization in the execution, restoration, and maintenance of works of art, which were entrusted to slaves with specific titles such as *ad statuas* (of the statues) and *ad imagines* (of the pictures).

In general, then, Roman organized groups included workers considered exclusively as producers. Concerning artists in the strict sense the evidence of the existence of specialized associations is scanty and doubtful, though some did belong to one group or another. It is noteworthy that the associations most specifically connected with artistic work were those concerned with various aspects of the art of jewelry making. The first opportunity for the formation of an artistic tradition in Rome came with the creation of a state mint; but an autonomous Roman tradition of types and style did not appear before about 250 B.C., and even the fact that the issues of the mint gave important families an opportunity for self-glorification did not foster establishment of high artistic standards (see COINS AND MEDALS). Triumphal painting, too, normally entrusted to slaves, failed to rise above the level of occasional art, and there has been found no evidence of the formation of schools and associations.

Changes in Roman society and ethics after the 3d century B.C. restricted interest in art to the circle of a few great families and brought about the importation of such artists as Metrodorus, family artist and tutor to Lucius Aemilius Paulus (see PATRONAGE).

The lack of critical preparation on the part of the Roman public and the conservative nature of its tastes led to the setting up in Rome of workshops of sculptors in marble following the various currents of classicistic taste. These workshops appear to have been hereditary, but the number of local craftsmen

and assistants who received instruction in them must have been considerable. This situation persisted under the Empire, with the triumph of stylistic tendencies officially approved by the emperor and expressed in the work of certain groups of artists (e.g., the group at Aphrodisias in Asia Minor).

In the late-antique and Byzantine periods, the production of works of art became increasingly centered around the court and so more and more influenced by its bureaucratic organization. Such objects as tapestries, hangings, cloth, and jewelry were produced in great public workshops equipped according to their rank. All possible private initiative was thereby stifled.

Edicts of Constantine and his successors granted tax concessions to the craftsmen who came to Constantinople from every part of the Empire and were particularly generous toward those who brought with them their families and their workshops.

Italo SIGNORINI, Lionello LANCIOTTI, Paolo MATTHIAE, and Giancarlo AMBROSETTI contributed portions of this section.

CORPORATIONS, WORKSHOPS, AND SCHOOLS IN THE MIDDLE AGES AND THE RENAISSANCE. Throughout the Middle Ages and thereafter the organization of artistic life, from both the economic and the legal point of view, was based in effect on three institutions: the guild, which gathered in one organization craftsmen of identical or similar occupation; the workshop, in which an individual master craftsman worked with his assistants, carrying on a legally recognized teaching activity; and the *ministerium*, or works department, of a great public or private undertaking, which cut across the various trades and employed craftsmen belonging to several guilds and workshops. These three institutions had the same fundamental character in that they were all formed by the free association of free men lending their services on the basis of contracts drawn up in accordance with the requirements of the law. There were naturally some intermediate institutions, such as the monastic scriptoriums, which produced illuminated manuscripts and functioned in a manner very similar to that of a workshop, though lacking the latter's economic purpose. The triple division, however, covers in practice all the activities of medieval craftsmen. It should be noted that the distinction between artists and craftsmen, which was to be made so haughtily in the Renaissance, had no economic justification in the Middle Ages. The greatest excellence and the most highly specialized workmanship were to be found within the guilds (even if the association to which the artists belonged was often in itself poorer than the associations of their patrons, for example the merchants). The lack of prestige accorded to artists was largely counterbalanced by a greater freedom of action and less control by the civil authorities. As the results show, the average level of individual work was generally much higher than that of the works produced by second- or third-rate artists of more recent times, since the disbanding of these corporate associations.

Detailed studies of the corporate institutions covering those higher forms of craftsmanship now understood by the word "art" are unfortunately almost nonexistent, and the relevant documentary material is unusually scanty before the 13th and 14th centuries. Any sort of group organization, however, inevitably exercises influence on style and on economic and geographic distribution. For this reason it is worth trying to deduce, from information about other bodies, the principles upon which the social organization of artists was based, until the economic blossoming of the towns and the emergence of larger numbers of private patrons produced a great expansion of artistic activity.

The continuity of the large-scale workshops of late antiquity is a factor of exceptional importance for the entire Middle Ages and also for much of the modern period. These workshops were organized and maintained by the imperial court, by the great monasteries, and by the cities. Such large workshops produced articles of high quality and value for a very small number of customers, or else realized vast collective undertakings covering many years or decades, or even, as in the case of the great cathedrals, never really coming to an end because of the requirements of maintenance. The importance of these groupings of artists derived from several factors. First, craftsmen were selected not on economic but on strictly artistic grounds, and members were chosen not only from a city, but from entire nations or even from all Europe. Second, in these organizations there was a close connection between those who commissioned and those who carried out the various projects, with the result that daring experiments were possible and figural style was immediately affected by such things as fashion, the study of ancient treatises, or the impact of poetic and literary images. These workshops also stimulated competition, encouraging patrons to strive to outstrip each other with products of richness and quality; at the same time the workshops provided a testing ground for new systems of work which then spread to lower, more popular levels of production. Almost all the major stylistic trends of the Middle Ages — the Carolingian, the Romanesque, and the Gothic — can be attributed in part to the positive influence of this method of organization. There is detailed information only about the works departments that existed in the towns — and actually only about the organizational and financial aspects of the building of certain cathedrals. Both from surviving important buildings and particularly from the very rapid adoption of successive improvements in Cistercian monasteries throughout Europe (for example, in methods of lighting and roofing) it can be deduced that an equally fruitful and complex group activity existed in the great religious and political centers of the early Middle Ages, and that its results were carried even to remote places by parties of specialized craftsmen. Such workshops combined the functions of a central planning authority — they were equipped with schools and with a generous supply of cultural aids, such as manuscripts and albums of drawings — with some of the functions of a central production unit, as they included smaller workshops capable of turning out and distributing some of the essential elements of construction: architectural decorations, capitals, and columns. Such a situation had already existed in Byzantium at the time of Justinian. The most famous cathedral works departments were only a reflection and a continuation of these centralized initiatives. Later their organization increased in complexity, eventually giving rise to such forms of association as Freemasonry, which went beyond purely artistic or economic matters to acquire an ideological *raison d'être*. Such great forms of organization present an extraordinarily happy synthesis of intellectual and practical elements.

At first the economic and spiritual control of these organizations was often vested in an enlightened bishop or abbot; one thinks in this connection of the extraordinary capacity for stimulating and encouraging artistic activity possessed by men like Abbot Suger. In time this role was taken over by the chapter — an assembly of canons with great legal autonomy — or by the civic authorities, especially in Italy. Gradually these institutions became more independent, even at the expense of the ecclesiastical power. The cathedral represented the interests of all classes, who shared the expenses of its construction and in return used it for their meetings and sought as an honor the right to representation. Moreover, as J. Gimpel pointed out, in the elaboration of plans and the carrying out of the work, the functions of the chapter were more or less comparable to those of a present-day department of city planning and urban renewal.

The problems were of the same nature: expropriation of property, finance, and the awarding of contracts. The difficulties which arose in the realization of large-scale projects were by and large similar to those which arise today. For this purpose the chapter appointed a supervisor whose job it was to run the department and keep the building accounts. It was thus necessary for him to be both a good businessman and an architectural expert. His responsibilities included the supplying of necessary materials (which sometimes had to be brought from a considerable distance), the taking on of new staff, and the paying of wages. Closely connected with the supervisor was the architect, who often enjoyed the highest prestige, being accorded even the dignity of a university title (Pierre de Montreuil, for example, was referred to in his epitaph as "docteur-ès-pierres"), and who had little connection with

UP State Museum, Lucknow

the practical side of the work. Toward the middle of the 13th century Nicolas de Biard (quoted by Gimpel) wrote: "In large buildings it is usual to have a principal master who sees the work forward by words alone, but who rarely or never uses his hands, and who nevertheless receives a bigger salary than the others . . . . The master masons who have stick and gloves in their hands say to the others 'Cut here and here'; they themselves do not work at all, yet they receive larger salaries." The major architects, many of whom had reached this position from the humblest beginnings, occupied a clearly defined social position in the works departments of the cathedrals and belonged to a special class with exceptional privileges such as the use of specially reserved premises for working on their plans, maintenance at the chapter's expense, receipt of presents of clothing and furs, exemption from levies, receipt of monetary rewards, and the right to serve as consultants. Moreover, only well-known architects, by virtue of their continual travels, could keep up to date with the various technical advances achieved in other centers.

Beneath the architect there were various groups of specialized craftsmen, who jealously guarded their privileges and secrets. Among these were the *appareilleurs*, or stone dressers, who marked the stones to indicate how they were to be cut ("He it is," wrote Pierre du Colombier of this type of craftsman, "who prepares the area or layer of plaster on which he then draws in full scale the elevation of a vault or of another part of the building, with all the developments of which it is capable, and finally draws it in projection"); the master carpenters; the master masons, capable of reading the architect's drawings and of deducing an elevation from a plan; and the carvers and their assistants, divided into two categories, paid according to the type of stone used and naturally possessing a very different training and background. In England, for example, those who worked a particularly hard stone were called hard hewers; on the other hand, the freestone masons, or freemasons, worked an excellent limestone particularly well suited to the delicate work of carving. Stress has rightly been placed on the imaginative freedom displayed by the latter artists, whose work was sometimes unacceptable to the chapter because it flouted too openly the orthodox iconographic tradition. Finally came the masons, arranged in various classes down to the humble laborers and all recorded in the surviving account books.

Despite its multiplicity of functions, the works department was united by a bond of secrecy which gave it the distinctive appearance of a form of corporate association, even if temporary. The masons and carvers together formed a lodge, an organization which at times became a real confraternity with considerable commitments of a devotional and economic nature as well as in the field of mutual assistance. In the lodge important decisions concerning the members' work were made in general assemblies. The Regius manuscript (1390; cf. D. Knoop and G. P. Jones, 1949) recommends the following conduct to the apprentice. He must keep the counsels of his master to himself and not reveal them. He must not reveal to anyone what happens in the lodge nor what he hears or sees there. He must not pass on to anyone the counsels of the lodge nor those of the chamber but keep them to himself as a point of honor to avoid incurring blame on himself and shame on the trade. Secrecy is found even within the subdivisions of a craft; thus Etienne Boileau, provost of Paris after 1258, wrote in his *Livre des métiers* (paragraph VII of statute 48) that masons, stonecutters, plasterers, and others "may have all the assistants and apprentices that they want, provided that they show them absolutely nothing of their trade." These exhortations to secrecy explain the existence of special instructional works, usually beginning with a series of solemn religious formulas, handed down in manuscript form within the same workshop, literally for centuries; such is the *Painter's Manual of Mount Athos*, still in use in 1800, the notebook of Doxaras, the Russian *podlinnik*, the treatises of Armenia, the various books of formulas for colors, mosaics, and painted glass, and manuals on glass blowing. These are aspects of the medieval guild, an organization in some ways simpler than the cathedral companies.

There was, if not a continuity, at least a derivation of the medieval guild from earlier forms of craft associations such as the *collegia* of late antiquity and the Byzantine schools. All these forms of association were designed to meet the same economic and social needs, which can be summed up as follows: (*a*) they brought together craftsmen belonging to the same trade, protecting their rights with respect to each other and to their patrons or outside authorities, intervening on behalf of the craftsmen in disputes and legal cases; (*b*) they procured for their members certain exclusive privileges such as tax reductions and exemptions from military service or from particularly ignominious forms of punishment; (*c*) in cases of sickness, they came to the assistance of orphans and widows of poor craftsmen, and they assisted members in their old age; (*d*) they possessed assets of their own, received from such sources as subscriptions of members, donations, and fines; and (*e*) in the same way as a confraternity, they conducted their own religious rites, funeral services, and celebrations. Naturally, the power of the organization was in proportion to the number of its members and the size of their income, and therefore to the contributions that they could afford to pay. Such highly specialized crafts as those related to the arts were thus at a disadvantage, for though their products were expensive, the volume of production was small. Although the merchants established many foundations throughout the Middle Ages, before the Renaissance there were few buildings designed as meeting places for such craft associations; of the few examples which do exist most are chapels erected at the expense of associations of masons such as the *magistri comacini*. Another consequence of the relative poverty of artistic guilds is the absence of any significant iconographic tradition, with the exception of the representation of St. Luke painting the portrait of the Virgin, a widely diffused iconographic theme associated with the painters' guild. It was not until the late Renaissance that the order of importance of the guilds ceased to depend on economic and political factors and came instead to be based on esthetic and cultural considerations. It is interesting to note, however, the existence in the late Middle Ages of certain collective expressions of opinion in this sense; for example, the preamble to the statute of the Sienese guild of painters, dated 1355, exalts the profession as an ornament of sacred oratory and of grammar: "We are those who by the grace of God reveal to dullards who know no letters the wonderful things done by and in virtue of our Holy Faith."

Despite these aspirations, however, the social organization of even the most liberal artistic professions remained the same as that of other trades. It will suffice to survey in general terms the organization of those bodies — *collegia*, schools, guilds, and the like — to which artists have belonged at different epochs. From a historical and artistic point of view it matters little whether these corporations were subject to any form of pressure from the state — insistence on the principle of hereditary trades, compulsory relocation of craftsmen, or prohibitions against their free movement. Such pressure, in fact, mainly affected associations whose field of activity impinged upon the public good and in practice was restricted to the building trade, whose members were faced with certain obligations in connection with fires and with military and defense work. However, not even the Byzantine corporation concerned with the construction and adornment of buildings, which included among its members carpenters, smiths, painters, and marble cutters, functioned on the principle of heredity. Nor did the state regulate the use of the corporation's property. Indeed, this particular Byzantine association, in comparison with those established elsewhere, seems to have been fairly free from rules and regulations. The growth in importance of corporations, and the consequent promulgation of statutes, seems to have been brought about by economic factors and by the desire both to limit or suppress competition, particularly outside competition, and to control the pressure of the new generations. This promulgation of statutes occurred at a fairly late stage in the evolution of urban economy and, significantly, concerned largely craftsmen working on the production of luxury objects, whose work was in no way concerned with the public good: goldsmiths, tapestry makers, and *tailleurs d'images* — those crafts-

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

men who had most to fear from widespread competition. Municipal control made itself felt by these craftsmen in three ways: first, by passing sumptuary laws that limited the maximum value of certain products, particularly in the realm of dress and furnishings, and perhaps even prohibited the production of certain items; second, by applying to artists the same system of controls used for other guilds, whereby workshops of similar type had to be located in the same street or zone; third, by granting tax concessions to famous master craftsmen who taught extensively. The edicts of Theodosius (codified 5th cent.) show that membership in corporations concerned with the public good was compulsory and hereditary. The consequent stifling of experimentation and cross-fertilization of ideas occurring outside the specific field of activity of each individual trade must have seriously hampered the development of new techniques and styles. To fill the gap, some of the more important *collegia* (including perhaps the one concerned with building construction) had recourse to forced enrollments and even recruited from among prisoners. The *collegia* were organized according to imperial decree. Their members all followed the same trade; membership was compulsory and included even slaves. To understand the evolution of the guilds and the comparative flexibility with which the corporations adapted themselves to changes in the administrative situation of the cities, it is helpful to know that by law their organizational structure was modeled on that of the city, with patrons, magistrates, a senate, and the plebs, or people, and also official lists of officers and members, an annual register, and a roll of new members. According to the information assembled by P. S. Leicht, the administration was divided between the magistrates and the general assembly of members. In the larger colleges the place of the assembly was sometimes taken by a committee of decurions. Meetings took place in the "school," in the temple of the college, or in a public place. The prefect, or president, or, more often, the two prefects of the college remained in office for five years. Under them were the custodians, treasurers, secretaries, and an "actor," who served the college as its legal representative. The prefects, though elected by the assembly, in some cases had to be approved by the state. Sometimes the office of prefect was given to famous personages whose generosity might be expected to benefit the college; a similar munificence was expected from the patrons, to whom commemorative statues were often erected. The income of the college derived from the entrance fees and monthly subscriptions of members, from gifts (such as those made by officers upon election), from revenue on various assets (used for funerals and other charitable and religious purposes), and from the proceeds of fines for infringement of the college statutes. The advantages enjoyed by members, as laid down, for example, in Rome in the Codex Theodosianus (XIV, 2), included exemption from special levies and from military service, unrestricted permission to reside in the city, freedom from certain taxes, the possibility of achieving the rank of knight (with consequent exemption from torture), the possibility of enjoying monopolistic privileges, and the opportunity of acquiring materials in bulk through the college.

There is no reason to draw any sharp distinction between the Roman *collegia* and the schools of Byzantium, whose privileges were roughly the same. The records of the Prefect of Constantinople show clearly that in about the 9th and 10th centuries there were at least twenty-two corporations, some of them concerned with the production of artistic objects (jewelers, silk weavers and dyers, building constructors). These corporations had features which were already remarkably similar to those of the guilds. Admission was open only to citizens of the Empire who were capable of paying the entrance fee and was subject to the explicit approval of the assembly of members, the president, and the prefect of the city, to whom, as in Rome, the councils were legally subject. The corporations tended to limit as much as possible the number of admissions and to impose strict obligations on members, with very severe penalties which in some serious cases — such as the adulteration of goods, the falsification of weights and measures, and illegal competition — included the cutting off of the offender's hands. Special permission and the completion to the satisfaction of the corporation of at least one major work were required before a member was allowed to set up a workshop of his own.

The president of the school was either nominated by the assembly, subject to the approval of the prefect of the city, or nominated on the authority of the latter. The prefect kept a careful list of all the objects produced, fixed their price, and determined their quality and quantity. For ease of control, workshops of similar nature were grouped in the same street or quarter, and those producing luxury objects, such as jewelry, were situated in the city center. In the event of disputes with a customer, the president of the guild intervened as mediator. The schools were allowed to own property, and they performed important religious activities as well as providing for the welfare of their members. Similar characteristics were to be seen in the early medieval schools established for the carrying out of modest commercial ventures in such Byzantine cities as Ravenna, where there is evidence of schools in the years 943 and 954. These schools were free associations of private individuals who joined together in the hope of obtaining concessions or other exclusive rights and were ruled by a *maior* or *capitularius* elected for life, with officers such as a *judex* or *vicarius* drawn from the membership. The freedom enjoyed by these associations was very great; moreover, in later documents their members are designated *vir honestus* (free man). The *Honorantiae Papiae*, compiled during the years 1004–24 to inform the emperor Henry II of the privileges enjoyed by the royal chancellery at Pavia, show that in this city, too, which was part of the Western Empire, there existed several guilds, called *ministeria*. These guilds, as A. Solmi established, were subordinate to the central administration and were organized around magistrates who both directed their activities and, though responsible to the state, did what they could to defend the privileges of the trade and to obtain acceptance for its products. The members of these *ministeria* were obliged to submit all their disputes to the jurisdiction of the king and the treasurer and were subject to general and special levies paid to the treasurer or the court for the privilege of practicing their trade. There must have been other associations of craftsmen free of central control; there are Lombardic documents dating back to the 7th century which speak of master builders at the head of small groups of craftsmen for whom they are exclusively responsible. Perhaps the subordinate position of the guilds in the *Honorantiae Papiae* derives from the fact that they had received monopolistic privileges from the royal chancellery. It is noteworthy that the word *artes* was used as early as 599 by Gregory the Great to describe those corporations having their own statutes.

With the development of urban life and the growth of local industry and initiative, the guilds increased in number, perhaps favored by greater specialization of work and by the fact that state-sponsored undertakings were ceasing to monopolize the activities of craftsmen and were being rivaled by private commissions. These associations, variously named according to the language and region (*arti*, *compagnie*, *paratici*, *gilde*, *gremios*, *Innungen*, *Zünfte*, *ministeria*, *fratelea*, *fraglie*, *università*, etc.), came into being in different ways: in some cases they were founded by the local authorities (evidently on the model of Rome and Byzantium); in others they began within the large works departments as a bond among those engaged in the same type of work and a means of defending their own economic interests and privileges. In return for official recognition, the guilds undertook to maintain a rigorous self-discipline and control over their members. As at Byzantium, the leading master craftsmen were exempted from taxation, in return for certain teaching duties. Entry to the guild was subject to the payment of a fee, the completion of an important work, and a decree of the guild giving the new member the right to set up in trade on his own. This permission sometimes must have been very difficult to obtain, for frequently young artists left their own cities to work under masters in other localities or to enter into partnership with them in order to practice their trade. The interests of members were strenuously defended against outsiders, who were often compelled to move

elsewhere. The types of guilds were many and varied; this account deals only with the situation in Italy and is based on the data collected by C. E. Ferri. Like earlier forms of association, the guilds had an administrative structure modeled on that of the city. They were ruled by an *abate*, *console*, *priore*, or gastaldo (administrator of the royal demesnes in the Lombard kingdom), assisted by a council and controlled by syndics. Under the head of the guild were such officers as the *camerario* (treasurer) and the *scrivano* (secretary), and possibly some messengers or beadles, whose job it was to collect dues, summon members to meetings, and so on. Every guild had its statutes and kept minutes of its meetings and up-to-date lists of members — valuable documents which make it possible to establish when a young master craftsman began to work on his own. The council of the guild exercised a strict and vigilant control over its members, and the penalties that it imposed were supported by the state; the council had the right of search and interrogation, of holding official inquiries into matters within its jurisdiction, and of receiving evidence in secret. Until the 13th and 14th centuries, the general chapters were usually located in churches and religious houses. The guilds organized solemn ceremonies and forms of corporate worship, helped aged workmen, widows, and orphans, and provided dowries for girls of marriageable age; the richer quilds founded hostels and hospitals for their members. The guilds also assumed responsibility for the unemployed and provided them with work. They took over both the social authority exercised by the large workshops of late antiquity and the protective role of the patrons of the *collegia*. Without them it might have been impossible for craftsmen to break away from the cathedral or palace works department, to form their own workshops and clientele, and thus to come into closer contact (even geographically) with the new demands of the lay world.

For the individual workshop, too, the first records go back to the early Middle Ages. The workshop was a typically capitalist organization requiring continuity of work and, therefore, the simultaneous execution of several works or projects, a notable specialization of trades, and a complex internal organization. By the end of the 13th century (particularly with Giotto) the medieval workshop had acquired the authority of the old large-scale workshop of Roman times, dealing with the popes, powerful religious orders, and rich merchants, and supplying not only plans of works but the skilled personnel necessary for their realization. These craftsmen were itinerant, sometimes following the head of the workshop from place to place and sometimes working without him, using his plans, cartoons, and other equipment. The merging of the role of master craftsman with that of contractor and businessman was one of the many effects of the parallelism between the organization of artistic activity and that of craft and manufacturing activity. The only essential distinction, from the economic point of view, is that art remained a luxury product, could not be duplicated, and so was not amenable to any sort of mass production. For this reason the strength and authority of important workshops was more moral than commercial; actually they assumed more and more an intellectual position. Their attempts to achieve dominance, or even monopoly, involved, among other things, the development of their didactic activity.

The most ancient documents on the organization of the workshop are probably the codex of Rothari, King of the Lombards, of Nov. 22, 643 (articles 144, 145), and the supplementary memorandum of Liutprand of Feb. 28, 713, where it is stated that the master builder is responsible for accidents which occur during the course of work and must therefore himself provide the necessary compensation (here the title "master" indicates the head of a workshop, not of a corporate association). According to U. Monneret de Villard and P. S. Leicht, each master builder was actually a contractor who had working with him people of similar interests, "which is not to be taken as evidence of a corporation, but simply of a link binding together different artists in a common undertaking." Only in an organization based on the workshop could projects — some of considerable size — be undertaken in other regions, as was to be true later of the wandering *magistri comacini* and *magistri antelami*.

Some sort of workshop structure, with active master craftsmen and assistants at various levels of specialization, must have existed within the large-scale organizations of late antiquity. One of the most interesting bits of evidence is provided by the salary tables for mosaicists set out in the edict of Diocletian. In order to be able to undertake a decoration by itself, a workshop had to consist of three groups of artists. The most highly paid was the *pictor imaginarius*, who enjoyed absolute authority and earned 175 sesterces a day. His job was to provide the design of the composition and any other graphic work required, whether of a formal or iconographic nature. Since mosaic decorations were employed mainly in public and sacred buildings, the *pictor imaginarius* had to be well informed about all the ceremonial and theological details connected with his decorations, so that even before undertaking the work he had to collaborate closely with courtiers and various important personages — a situation which was repeated in similar circumstances at least until the baroque period. The *pictor imaginarius* appears to have been a cultured man, at home in society, acquainted with the problems of iconography, and in command of a broad repertory of subjects to be made available to clients and patrons. It is not known whether in addition to the over-all design he also provided detailed sketches for individual figures, but in workshops which carried out the entire work on their own this is highly likely, as the *imaginarius* was presumably also in charge of the job. Since the methods of work in late medieval and Renaissance workshops were undoubtedly traditional, these mosaic workshops probably used albums similar to the well-known ones of Jacopo Bellini or collections of cartoons, such as those utilized at various times in Giotto's workshop, with sketches and plans of entire schemes, drawings of individual parts, such as heads (especially if used as portraits), of whole figures in different costumes and attitudes, and of such details as arms and hands, jewels, cloth, and architectural decoration. One of the stylistic consequences of this method of work was the frequent repetition of the same movement or attitude and of identical arrangements, even if sometimes reversed, of hands, feet, and other parts.

While the *imaginarius*, having decided on the over-all composition, applied himself to the preparation of detailed drawings, the *pictor parietarius*, who earned a little less than half the salary of the *imaginarius* (75 sesterces a day), began to transfer the design to the wall. Some indication of his method of work is to be found in the sinopia drawings discovered, for example, beneath the mosaics in Milan, in Rome, and in the Church of S. Marco in Venice. These drawings are rare, indicating that direct sketches on the walls were used only in cases of special technical difficulty; it is significant that when such drawings appear there are usually later changes in the composition. Though the duties of the *parietarius* are fairly clear, it is difficult to discover what system he used to transform the design of the *imaginarius* into the finished composition, inserting the figures, details, and various other elements provided by his colleague, and dealing with the problems raised by the different dimensions and perspective and by the possible curvature of the wall. Perhaps he employed a type of cartoon. It seems clear that it was also his job to provide all the necessary supplementary details (backgrounds, general landscape elements, and even secondary figures), for there is often a distinct contrast of style between the protagonists of a scene and the figures which accompany them and also between their pictorial treatment and that of the background.

Last is the *musearius*, whose salary was 50 to 60 sesterces a day. A remarkable craftsman of unequalled technique, his job was to select, sometimes on the basis of directions given him by his colleagues, the pieces of colored glass forming the mosaic, which he usually obtained from oval blocks of glass. It is clear that the work of one *musearius* was not enough: as a workshop progressed from the planning state to the execution of the work, an ever-increasing number of unskilled workers became necessary. The creation of mosaics, however, was a complex operation (though not so complex as building construction). In the case of frescoes, the *pictor parietarius* needed only less specialized assistants to prepare his colors, and in

cases where a preexisting model such as a miniature was followed, the *pictor parietarius* could be head of the workshop, aided only by one or two skilled assistants and some apprentices.

This same organization, more as the result of practical considerations than of the influence of custom, lies at the basis of the late medieval workshop. Concerning workshops, information begins to be precise only about the 14th century, with the beginnings of a biographical historiography, followed later by the evidence of legal documents, when new economic conditions caused apprentices to try to break free from their masters before the stipulated time, as in the notorious series of suits involving Francesco Squarcione. The workshop fulfilled a definite educational function (see EDUCATION AND ART TEACHING), and the distribution of tasks was proportionate to the ability of the young men receiving instruction. Usually there were three categories of craftsmen, defined by law: the master, who was in charge of the workshop and at the same time taught those under him; the assistant; and the apprentice. Apprentices began work at the age of thirteen or fourteen. After five or six years they obtained certificates and were no longer considered apprentices; after three or four years more, if they passed an official test judged by the head of the guild, the councilors, and a notary, they were appointed masters and could set up their own workshops. In the training process the necessity of passing through these various stages, which in themselves constituted a process of selection, enabled the young aspirant to master all the techniques at different levels. Frequently these workshops had a family character, and the patrimony of drawings, cartoons, and other equipment was passed on from father to son, brother to brother, or even brother-in-law to brother-in-law. It was by no means uncommon, however, for an apprentice to remain, even after becoming a master, in the workshop where he had studied, eventually inheriting its good name and its property.

Eugenio BATTISTI

The practice of training in a workshop remained in force throughout the 15th century and was mentioned in the following way by Cennino Cennini about 1400: "Begin to submit yourself to the direction of a master for instruction as early as you can; and do not leave the master until you have to" (Cennino Cennini, *Il libro dell'arte* or *Trattato della pittura*, III, trans. D. V. Thompson, Jr., Yale Univ. Press, 1933). This form of association, as in the past, was the only one ratified by the law which guaranteed its position. In the 15th century, however, the workshop underwent a notable expansion and acquired a previously unknown flexibility. This was in part due to its routine, by then almost standardized, which brought the young man by various stages from the apprenticeship to the grade of master. "Know that there ought not to be less time spent in learning than this: to begin as a shopboy studying for one year, to get practice in drawing on the little panel; next, to serve in a shop under some master to learn how to work at all the branches which pertain to our profession; and to stay and begin the working up of colors; and to learn to boil the sizes and grind the gessos; and to get experience in gessoing anconas and modeling and scraping them; gilding and stamping; for the space of a good six years. Then to get experience in painting, embellishing with mordants, making cloths of gold, getting practice in working on the wall, for six more years; drawing all the time" (Cennini, CIV).

Sometimes apprentices received a salary; sometimes they themselves paid the master, depending on the latter's fame and on the amount of actual work they did. They lived with the master, who often adopted them as godsons (this was true of Giotto and his pupils Taddeo and Agnolo Gaddi in Florence, and of Squarcione in Padua with a large number of disciples, among them Marco Zoppo and Mantegna); this practice, however, often gave rise to exploitation. The number of pupils varied a great deal; in the case of Squarcione it is said to have reached 137 in a few years (as reported by B. Scardeone). The legal aspects of all matters relating to the profession were dealt with by the guilds, whose statutes had the force of law. In general, these statutes defended local interests against the intrusion of overindependent external elements; but in Genoa there existed a *Consortia de li Foresteri*, or guild of foreigners, with statutes dated 1393 and 1485, whose purpose was to legitimize and reinforce the position of such elements within the city. These 15th-century statutes contain nothing new, but it was in this period that most of the guild statutes were drawn up, either to codify traditional practice or to bring up to date earlier rules. In Rome, for example, there had been a *università*, or guild, for a long time; but it was not until 1406 that the guild of marbleworkers had its own statute, while the statute of the guild of painters, known as the Compagnia di S. Luca, dates from 1478. The latter statute laid down rules governing the relations between painters and the organization of the guild and contained provisions concerning meetings, fines, and so forth. Against the sentences of its court, which were promulgated on the Campidoglio, there was no appeal. However, the Roman *università* remained solely a professional organization and took no part in city government, where its consuls had no powers of representation. The Compagnia was presided over by a director, three councilors, and a treasurer; the payments made by members — the entrance fee was two gold ducats — were used for the celebrations prescribed by statute and for the payment of the rector and other officers charged with direction of the guild's affairs. The statute of the painters of Padua dates from 1441; it specifies the different types of assistants and apprentices between the ages of fourteen and twenty-five. Another known Paduan statute was that of the *fraglia*, or guild, of stonecutters, drawn up in 1494, which fixed the entrance fee (very high for craftsmen from other areas in order to protect local carvers), established regulations for the sale of carvings (for example, one could sell only works carried out in one's own workshop; dealing in works executed outside Padua was forbidden), and contained stipulations concerning workshops (each master could have no more than one apprentice, who had to undergo six years of training before becoming a master). In 1441, about a century after the painters and goldsmiths, the masons of Siena drew up their ordinances, which clearly defined the boundary between "the art of the carpenter and that of the stonecutter," according to an agreement reached "in the presence of the officers." Other 15th-century statutes include that of the carvers of Rome (1406), now lost, that of the stonecutters of Cortona (1414), the main purpose of which was to fix the religious festivals, and that of the *università* of painters of Cremona (1470). Particularly severe were the laws governing the length of the apprenticeship (ca. 6–10 years) and of the discipleship (ca. 10–12 years) and the financial and other arrangements existing between master and apprentice, which varied according to whether the young man was a pupil or merely an assistant. The contributions demanded by a guild were at times heavy (in 1472 Leonardo owed money to the Florentine painters' guild) and so, too, in many cases were the other obligations of membership.

ART ACADEMIES FROM THE 16TH TO THE 18TH CENTURY. At the beginning of the 16th century, as in the preceding period, the workshop was still the basic unit of artistic organization. Various artists have left much information concerning it. Some workshops grew to an impressive size, and those who studied there made considerable sums of money (as did Cellini, for example, between the ages of fifteen and eighteen). The apprentice ranked just below the assistant, who shared the profits of the master (Cellini, *Autobiography*, par. 22). The guilds, too, continued to exist, drawing up or improving their statutes (gold- and silversmiths of Rome, 1509; carpenters, goldsmiths, and painters of Bologna, in 1559, 1572, and 1602 respectively; and architects and engineers of Cremona, 1688). Nevertheless, even though to all appearances the relations between artists, both within the workshops and outside, were still controlled as before, a new factor, the growing interest in the individual, was leading many artists to regard the old ties of corporate association as no longer binding. One of the first controversies was connected with the name of Michelangelo and led eventually to the laws discussed below. In fact, the workshop was moving toward a crisis. Michelangelo had no school in the

UP State Museum, Lucknow

traditional sense; his followers were either manual helpers or intellectual disciples, the latter, he boasted, being all of noble birth. Similarly, Leonardo started what seems to have been a small, select academy together with Francesco Melzi and G. A. Boltraffio, also retaining certain young men (e.g., Gian Giacomo Caprotti, called "Salai") as assistants with normal contracts. In view of the situation existing in the figural arts, the attitude of Michelangelo and Leonardo toward art and art education was clearly an innovation and reflects the great prestige of the literary and philosophical academies that had arisen in Florence and elsewhere in the first half of the 15th century. Leonardo was the first to protest against the typical routine of the workshop, which placed practical work above free interpretation. "Study knowledge first, and then follow the practice dictated by this knowledge." This view was echoed by Michelangelo, according to whom "one paints with the mind not the hand," and who considered sculpture to be a "scienza studiosa" (a learned science, not a mechanical or servile art). In this concept of art the link between master and pupil can only be an academy, a place of pure speculative study, where the relation between members is that formed by free research, without an ever-present authority, and where, in particular, the master no longer acts as contractor but allows his pupils to accept contracts and commitments with complete freedom.

A most important forerunner in the development of art academies was the school run by Bertoldo di Giovanni (q.v.), with the support of Lorenzo de' Medici, in the Giardini di S. Marco in Florence. This was the first institution to possess the essential characteristics of an academy, namely, erudite, learned training (which no longer consisted in manual assistance with the master's work, but in theoretical study alone) and disregard of the economic aspect of art and of the restrictions and limitations imposed by the guild system. It also had that connection with the court which to a greater or lesser degree was a permanent feature of the academy. Bertoldo's school was referred to by Vasari in very explicit terms, although doubts about its activities have recently been expressed by authoritative critics. Michelangelo is one of the many artists who are said to have studied there. The students, lodged at the court, probably had access to the Medici collections of ancient and modern art. Another later example of a school which bore the name academy (though the precise meaning of the word is debatable) was connected with Leonardo (Accademia Leonardi Vinci, as found in engravings by Leonardo or one of his close collaborators), who is said to have carried on a school in Milan at the court of Lodovico il Moro. Another such academy seems to have been run by Baccio Bandinelli in the Belvedere at the Vatican, as can be seen from two engravings, executed at different times, in which the master appears surrounded by a group of artists of all ages intent on copying ancient statues, studying anatomy, and so forth. The first real academy, however, was the Accademia del Disegno of Florence. Here, realizing that the guild had lost all importance and that the confraternity of artists "had entirely ceased to function," Vasari proposed a new system of organization intended to free artists from all corporate restrictions. A choice was to be made of the best artists, who would place themselves under the protection of the Grand Duke; architects, painters, and sculptors were to be united by a common interest in "disegno." This academy came into existence in 1563 with the support of the Grand Duke Cosimo I de' Medici and completely superseded the guild; the Compagnia di S. Luca became a subordinate body. The meetings of the academy were held in the chapter house of the Church of the SS. Annunziata, and its regulations, because of the authoritative support of the Duke, represented a victory over the local guilds, creating a situation in which the arts were at last clearly distinguished from the crafts and were freed from the legal ties by which the latter were bound. In 1571 a decree was published exempting painters and sculptors from the obligation of belonging to their respective guilds (Arte dei Medici e Speziali for painters, Arte dei Fabbricanti for sculptors). A similar step had already been taken in Rome: after several disputes between Michelangelo, Sangallo, and the guild, a brief of Paul III (1539) had freed sculptors from these ties, though painters had to wait until the publication of a similar brief by Gregory XIII (1577). One of the fundamental purposes of the Accademia del Disegno was teaching. Each year three "visitors" were appointed whose duty it was to visit the workshops and to help the young artists. In addition to this practical instruction, which supplemented but did not supplant the workshop, theoretical classes in geometry and anatomy were organized and held in the hospital of S. Maria Nuova. Apart from this rather general information, little is known of the structure of the Accademia del Disegno. Its first heads were Cosimo and Michelangelo, its first lieutenant, Vincenzo Borghini. In view of the not strictly technical but broader cultural aims of the academy, membership was not confined to artists but was also open to art lovers and dilettanti. The academy occupied a position of some consequence in the life of Florence, and its views were solicited on matters of artistic interest; however, this aspect of the academy, though represented in the three persons who were its first leaders, was not clearly defined. Fundamentally, Vasari's purpose in founding the academy had been not to educate but rather to reestablish and exalt the dignity of the profession, in emulation of the literary academies, and to break with the guild by putting the artist under the exclusive control of the prince. Federico Zuccari, however, in a program drawn up in the period 1575–78, wanted the didactic role of the academy to be divorced from all other problems and given absolute preeminence; he suggested the creation of a studio for life classes (the first time such a suggestion had been made), the institution of regular courses on theory, and the establishment of prizes (it should be added, however, that Zuccari's emphasis on teaching, stressed by Pevsner, is denied by Mahon). But Zuccari soon lost interest in the Accademia del Disegno as he became preoccupied with the foundation of an academy in Rome. The Florentine institution soon disappeared from the scene, not to reemerge until after 1630.

The first attempt to found an academy of art in Rome was probably that of Lorenzo Sabatini, who, according to Carlo Cesare Malvasia, unsuccessfully applied for a papal brief authorizing him to set up such an institution. Another painter apparently involved in a similar project was Girolamo Muziano. A full account of his program is contained in the biography of this artist written toward the end of the 17th century by the Lombard Lodovico David. According to this account, Muziano was inspired by the example of Vincenzo Catena of Venice, who apparently left his possessions to the local guild so that a school might be founded at the Church of Sta Sofia. The way in which David's account of Muziano's program, which was never put into effect, anticipates later developments is a little suspicious, and its authenticity is doubted by Pevsner. It is certain, however, that in the pontificate of Gregory XIII Muziano began to hold meetings with his followers in the Church of SS. Luca e Martina. In 1577 he obtained from the Pope a bull of foundation; although, owing to a series of practical difficulties, nothing came of the project, the wording of this bull is significant: "Painters and sculptors of Rome have represented to us . . . that the arts of painting, sculpture, and drawing were day by day declining in beauty and losing evermore of their glory and nobility, both because of the lack of proper instruction and of Christian charity, in which those who professed the fine arts could not perfect themselves for lack of teachers, and because artists still at the outset of their careers, urged by necessity or by the desire for gain, undertook important works which as a result were deprived of all adornment and lacking in that perfection which is proper to the arts . . . ." It was hoped that young artists, as well as learning about art, "would be diligently instructed in Christian doctrine, in piety, and in good behavior . . . ." These words reveal not only a crisis in the whole educational system of the period, but also a determination on the part of the Church to keep so important a branch of cultural activity firmly under its wing. It is revealing that when an academy of art was finally founded in Rome (1588) its "protector" was Cardinal Federigo Borromeo. Despite the swift success and wide diffusion of its methods, this Roman academy, known as the Accademia di

UP State Museum, Lucknow

S. Luca, was informed by the same principles that had inspired the Accademia del Disegno of Florence, though with a more effective didactic role. Like its Florentine predecessor, it aspired to be a cultural organ of high quality, its members including not only artists but also art lovers and men of letters, rivaling in quality and interests the membership of corresponding literary academies from which it derived its structure. Certainly this was not all, but the opening meetings of the academy, conducted for some months solely by Zuccari, were extremely abstract and dogmatic in tone. In words steeped in rhetoric Zuccari lectured on the meaning of "disegno," a concept regarded as a universal value, a dogma to be defended by the academicians, who composed and recited poems and madrigals in its honor. The novelty of the school's orientation, namely its doctrinal basis, rested on very personal principles, and once Zuccari's presence was removed the academy ceased to flourish. The subjects for public discussion were chosen by Zuccari himself: "What are figure, movement, gesture, attitude?" "In what does the substance of good painting really consist?" "What is history, composition, grace, and beauty?" All this was accompanied by a practical teaching program for young artists in which were adumbrated such modern educational methods as the use of scholarships and the encouragement of travel for purposes of study. Zuccari himself put his own house at the disposal of needy students from outside Rome. Every Sunday in the plenary sessions of the academy the students worked under the supervision of its members, 12 of whom, chosen by lot and called assistants, followed the students' progress and fixed their weekly program. "For some one thing, for others another, according to their capabilities: that is, one will be told to do drawings by hand, another cartoons, another reliefs, another head, feet, and hands; another will spend the week drawing from the antique, or copying the façades of Polidoro; another will draw landscapes, houses, animals, and similar things; others at the appropriate time will draw from the nude with grace and intelligence, or make clay models, clothe them, and draw them carefully. Some will do architectural drawings, others perspective; and those who do best are always to be singled out with some favor and for that week to be made superior to the others and the lieutenant and to be obeyed and respected by the assistant" (R. Alberti). This was an almost conventional program, out-of-date, in fact, compared with that of Muziano (if genuine), whose proposals included the establishment of a collection of plaster casts, the sending of the better students to Venice and Lombardy to copy the works of the local masters, the creation of a special studio for life classes, and the institution of scholarships and annual prizes.

Artists in Rome were not legally obliged to join the Accademia di S. Luca; those who did, however, were bound by the academy's regulations. Several clauses in the academy's rules are reminiscent of those of the medieval guilds: "no student may hold a meeting in his house or keep a model; no member of the academy may presume to tamper with ancient carvings and pictures." Fines were imposed on those who appropriated the works of others, offered a work for sale below the price fixed by others, painted licentious pictures, or tried to attract other artists' pupils. At first the relationship of the academy to the guilds was not clearly defined; by 1596, however, relations were badly strained, one of the difficulties being that the head of the academy had to be accepted by the Compagnia di S. Luca as its head, too. Finally, Urban VIII recognized the academy "as an authority superior to the craft guilds," but other associations continued to exist outside the academy. In Rome, the Accademia dei Virtuosi, at the Pantheon, founded in 1543 at the instigation of Desiderio d'Auditorio, with aims of a purely religious or charitable nature, numbered Pope Paul III among its members; other members included Domenico Beccafumi, Pierino del Vaga, Raffaello da Montelupo, Antonio da Sangallo the Younger, and later, in the 17th century, Bernini, G. B. Gaulli (known as Bacciccio), Giovanni Lanfranco, Francesco Mochi, Claude Lorrain, and Velázquez. The only artistic activity of this academy was an annual exhibition of works of art, held in the porch of the Pantheon on the feast of St. Joseph, patron of the academy. Later the exhibitions became more frequent, particularly in the 17th century, when similar events took place in other parts of the city (at the churches of S. Giovanni Decollato and S. Bartolomeo). An association with similar characteristics, the Sta Unione or Compagnia degli Artisti, was started in Fano in 1535. This was a religious congregation, and its aim was the preservation of the public peace.

The academies of Florence and Rome attracted the attention of artistic circles in many places. Van Mander, for example, after his sojourn in Italy, founded in Haarlem a flourishing institution modeled on the Italian academies. Where the position of artists was not firmly established, however, their situation did not improve. In advocating the founding of academies, Van Mander deplored the fact that, except in Rome, the relations between painters were everywhere still at the corporative stage. In Genoa, for example, the guild imposed severe restrictions on artists who had not submitted themselves to the established routine and exercised complete control over the importation of paintings and the immigration of painters. In Bologna no separate organization for painters existed before 1589. In Venice it was not until 1682 that painters were able to break away from the guild and found their own association (Collegio dei Pittori); sculptors had to wait even longer, until 1723, before achieving their independence. Before their emancipation these artists, for political reasons, had had to submit to being classed with craftsmen and manual workers and had been subjected to the same regulations. In 1620 an academy of painting was founded in Milan by the same Federigo Borromeo who had earlier been protector of the academy in Rome. This foundation, however, which had a limited number of students (24) and was directed by three *magistri* and three priests, was not a spontaneous creation but with its avowedly Counter-Reformational aims represented in some sense the imposition upon art of a religious ideal; for this reason its history has little relevance to that of artistic institutions. Since academies of art, as noted above, were linked with the court, their period of greatest development did not come until the triumph of absolutism, the first academy with a really active life being the French academy of the second half of the 17th century. As for the two mother academies of Rome and Florence, both gradually declined and were replaced by numerous private schools which also, as in the 16th century, took the name of academy. In Bologna the Accademia degli Incamminati, founded about 1586, had blazed the trail, and from the time of the Carraccis there had never ceased to be private schools, notable among them that of Francesco Ghislieri, in which Francesco Albani and Guercino took part. In Milan Camillo and Giulio Cesare Procaccina "maintained an academy in their own house" (G. Mancini); Giovanni Carlo Doria did the same in Genoa (G. Marino); while in Rome Poussin was admitted to academies "which it is the practice to hold during the winter in various houses" (G. B. Passeri). Giovanni Baglione, too, often mentioned "academies which exist in Rome." The same situation prevailed in Modena, Venice, Lucca, and in other Italian cities. Even the academy in Haarlem, founded about 1600 by Van Mander in collaboration with Cornelis Cornelisz. and Hendrik Goltzius, was entirely private in character and in no way affected the relationship between the painter and the guild. Such schools were held in the artists' studios or in the house of a patron, who paid the costs. These schools were not restricted to the pupils of a particular master but were based on relations of protection and friendship and were easily accessible; an artist could even attend more than one academy at a time. The study of the nude was widespread — indeed, it was the principal objective of these schools — but other subjects were not overlooked; time was found for the scientific study of anatomy based on the examination of corpses and skeletons, and sometimes even for the study of still life.

The Académie Royale of Paris evolved differently. In France Italian artists had worked with complete freedom throughout the 16th century; indeed, in 1608 Henry IV refused to approve the founding of a new association of miniaturists on the grounds that, like all the other guilds, it would hinder the

freedom of action of artists. Restrictions on artistic activity had reached the point of prohibiting the importation of paintings from abroad. Attempts by the guilds, however, to curtail the privileges granted to certain court artists and to limit their very number continued to be frequent; after one such attempt in 1646 had gone as far as the parliament, the court reacted in 1648 by founding an academy intended to end, finally, all forms of corporate association. The rules of this academy followed those of the academies of Rome and Florence. The subjects to be taught were architecture, geometry, perspective, anatomy, and history, followed at a later stage by life classes. Though it was modeled on the Accademia di S. Luca in Rome and contained no substantial innovations, this French academy was to be far more successful, because it was based on a more systematic organization, with a full series of courses with set timetables to keep the pupils well-occupied. In addition, of course, it enjoyed the constant protection of the king and formed a sort of palace school, ever ready to meet the vast and multifarious needs of a great court during a period of expansion. There was no limit to the number of academicians. The officers were a protector, four vice-protectors, a director, and four rectors; the teaching was in the hands of twelve professors and six councilors. Dilettanti were admitted to membership as honorary academicians or councilors. The pupils were divided into four groups: *simples élèves* (ordinary pupils), *médaillistes* (medalists), *grand-prix* (six places reserved for protégés, who were entitled to study in Rome at the Académie de France), and *académiciens* (children of members of the academy). All the pupils were under the care of a master whose work was coordinated by a supervisor. The general direction of their studies is described as follows by Félibien des Avaux (*Entretiens sur les vies et sur les ouvrages des plus excellens peintres anciens et modernes*, Paris, 1666–88): "It is advisable after having drawn for some time from the drawings of the best masters, to study ancient statues and then to return to nature itself, which has taught all the painters who have ever lived." There was a definite emphasis on the importance of drawing at the expense of color: drawing was "the pole and compass which guide us." The courses and life classes were supervised by the professors, who worked on a monthly rota and determined the models to be copied. Classes were not the only activity of the academy; it also organized exhibitions and awarded prizes to the better students. Even in Paris, however, students did not spend all their time in the academy; certain parts of their training, painting, carving, and modeling, were not done there but in the studio or workshop of a master with whom they lived and worked in a way almost exactly like that of the Middle Ages. Membership in a workshop was essential; without a certificate from a master, no one could be admitted as a student to the academy. At the beginning the academy received no financial assistance from the monarchy and was entirely dependent on the contributions of its members; however, in 1655, not long after its foundation, it was granted a royal subsidy and was given space in the Collège Royal, while from 1661 on it enjoyed the open support of Colbert. The King's favors reached the point of exempting from military service the young men enrolled in the academy and allowing pupils to use for their studies the pictures in the royal collections. Relations with the guild and corporation, strained from the outset, were soon completely severed, and the guild founded its own academy (Académie de St-Luc), directed by Simon Vouet. In 1651 this merged with the Académie Royale. The academy's monopoly was such that private schools were soon forbidden, and the life course became a prerogative of the royal institution.

In 1689 there was introduced a monthly examination of all the drawings produced by the students, on the results of which some pupils were rejected and others promoted to more advanced classes. Prizes, at first consisting only of the remission of fees, later became a notable feature of the academy, particularly with the institution of the four Petits-Prix and the Grand-Prix, which entitled its recipient to a stay of four years at the Académie de France in Rome. To compete for the Grand-Prix, students had to present a sketch on a given theme, usually Biblical (a preliminary selection of candidates would have been made on the basis of drawings). After a further selection the final verdict was given on the basis of the finished works, which were then exhibited to the public (first exhibition, 1667).

Closely linked with the Académie Royale was its offshoot in Rome, the Académie de France, where its best pupils stayed and worked. Founded in 1666, this institution had wide autonomy and was very effective as an educational instrument; it is also important as the first and most notable instance of a school established by a country in a foreign land in order to facilitate a more direct interchange of culture and to effect a more immediate acquaintance with the material of study. The foundation of the Académie de France by Colbert merely established on an institutional basis an already existing practice: scholarships for travel in Italy and study in Rome, the *bourse du Souverain*, had been awarded in Paris prior to 1666, the recipients including Poussin and Lebrun. In 1664 Colbert had founded in Rome an Académie des Inscriptions et Médailles, to which was later joined the academy of painting and sculpture; in 1671 the scope of the institution was extended to include architecture. No secret was made of the fact that one of the aims of the academy was to enrich French museums by sending back to France ancient statues, vases, coins, and artistic and bibliographical rarities, as Poussin had done during the reign of Louis XIII. In addition, painters and sculptors had the task of copying famous pictures and statues so that the royal collections might have copies of what they could not possess in the original. The students were 12 in number—6 students of painting, 4 of sculpture, and 2 of architecture. Only in the 19th century did their number rise to 20, and a music student was also admitted. The methods of study were those of the Académie Royale. The students worked hard, and the results of their labors were frequently sent to Paris and shown to the public. It was a custom of the academy, and one which still survives, that its life class was open to all who wished to participate.

The spread of academies in Europe was sporadic until the advent of neoclassicism. Those that did come into existence modeled themselves on the Académie Royale. Even the academies of Rome and Florence felt the influence of the Parisian institution; in 1673 the Accademia del Disegno, following the lead of the Académie Royale, opened a school in Rome (directed by E. Ferrata and C. Ferri), organized exhibitions, and instituted prizes for its pupils. A few new academies were founded in Italy. According to Carlo Cesare Malvasia, Lodovico Carracci's attempts to start one in Bologna were unsuccessful; but an academy was founded at Perugia in 1573, and in the following century others were started in Lucca (1640) and Turin (1678). The Turin academy developed directly out of the local guild of painters, sculptors, and architects. In the early 18th century academies were founded in Bologna (1709, Accademia Clementina) and Ferrara (1737). In France the academies of Nancy, Bordeaux, and Toulouse date respectively from 1702, 1712, and 1726. In Germany are the academies of Nuremberg (1678, founded by J. von Sandrart), Berlin (founded 1696, but soon declined and was revived only after 1750), Charlottenburg (1696), Augsburg (two academies, one founded 1710 by J. S. Müller, and the Kaiserlich Franciszische Academia Liberalium Artium, 1715), and Dresden (1750); however, all these resembled the private academies of Italy rather than the Académie Royale. This was also the case in England in the first half of the 18th century. Sir Godfrey Kneller (q.v.) in 1711 became the first Governor of the Academy of Painting in London, which seems to have been primarily a studio where the pupils served as assistants to the master. In 1720 a second such academy was begun by John Vanderbank and the French-born artist Louis Chéron, but it lasted only a few years. Sir James Thornhill in 1724 began a private academy in his own home. It was only with the establishment of the Royal Academy of Arts in 1768 (actually initiated in 1760 as the Society of Artists) that a true confederation of artists came into existence in England. Elsewhere academies were founded in The Hague (1656), Utrecht (1696), Amsterdam (1718), Antwerp (this originated in 1665 as an offshoot of the guild, for life classes), Brussels (1711), Bruges (1717), Stockholm (1735), St. Petersburg (1724), Edinburgh

(1729), and Copenhagen (1784). Another important academy was that of Vienna, founded in 1692, which achieved considerable importance after 1730 through the activities of Jacob van Schuppen and attracted many of the best art students from all Germany.

THE ACADEMY SINCE THE AGE OF NEOCLASSICISM. The vast upheavals of the 18th century, both intellectual and political, brought about radical changes in the institutes of art education and led to a gradual fragmentation and differentiation of their aims. The widely accepted classicist theories of Winckelmann gave academies an eclectic atmosphere and an intellectualistic tendency (particularly through the great importance given to drawing, "the foundation of painting"), features which many academies still retain. At the same time, changes in outlook encouraged the development of a new interest in historical studies, particularly archaeology; these studies became detached from the old academies and found expression in separate institutions, later to become of great importance in the field of learning. The rise of mercantilism and the development of industry also presented new problems for art education and led gradually to types of schools and associations which were at the opposite extreme, theoretically speaking, from the traditional idea of an academy.

Academies continued to be founded in large numbers in the 18th century. In Germany all imitated the model of Paris and followed the conventional educational program: drawing from drawings, then from casts, and finally from life; lectures on anatomy, geometry, and perspective; and copying works in the local art galleries. In the elementary class in Berlin there were three stages: students first drew flowers, ornamentation, *idealisch Laub*, or ideal foliage, and parts of faces; then details of the human body; finally the entire human figure. In Paris the Ecole Royale des Elèves Protégés, founded in 1748, followed a composite program in its courses: copying of pictures, composition, history and mythology, and perspective and anatomy. In the Vienna academy (entirely reorganized in 1783), the elementary course was followed by courses in sketching from the antique, life drawing, and landscape; in addition to painting and sculpture, the academy had departments for engraving, ornament, and architecture. In the academy in Copenhagen, founded in 1784, the courses after the elementary one were arranged as follows: ornament drawing, sketching from the antique, and life drawing. The Moscow academy (founded in St. Petersburg in 1724) added to the usual subjects mathematics, geography, languages, history, and mythology; anatomy and life drawing were included only in 1760. All these schools aimed at providing as complete an education as possible, from the general as well as from the artistic point of view, and their extensive program occupied much of the pupils' time. In the Moscow academy, for example, the first timetable allowed for 31 hours of lectures and classes each week. Moreover, in addition to their activities as centers of study, many of these academies were the source of every initiative concerning the arts. The Regia Accademia of Parma, for example, founded in 1757, was responsible for the development of the Museo di Antichità, the art gallery, a school of art, and the Ufficio Governativo di Sopraintendenza Artistica; it also organized competitions and cultural activities of the most varied kinds. A similar influence was the Accademia di Belle Arti (the nucleus of the Brera), founded in Milan in 1776 by Maria Theresa of Austria in an effort to remedy the low level of artistic activity. This academy acquired casts of Greek and Roman sculpture, organized (after 1805) annual exhibitions on its premises, awarded prizes and scholarships for study in Rome, formed a library open to the public, and assembled a collection of pictures which gradually became of prime importance, partly as a result of the acquisition, through the Monti bequest, of the pictures of the 17th-century Galleria Arcivescovile. Other achievements initiated by this academy included, about 1803, the forming of a Gabinetto Numismatico (Department of Coins and Medals) and a Museo Patrio d'Archeologia (now included in Museo Archeologico). The Venice academy, first projected in 1679 but not founded until 1750, instituted four annual scholarships entitling the holders to three years' study in Rome, where their work was for a time directed by Canova; it also made frequent additions to the galleries and acted as a consulting body for the restoration, buying, and selling of works of art. Particularly under the direction of Leopoldo Cicognara (from about 1808 on), the academy performed the task of approving the plans for new buildings, the arrangements for street decorations on festive occasions, and the layout of parks and gardens, thus taking over all the rights of the Collegio dei Pittori, which had fought the academy bitterly for many years and was forced to succumb. The importance of this academy is confirmed by the fact that all the great men of 18th-century Venice were members. In general, one can say that in the 18th century the academy really became in many cases the dominant artistic institution, embracing all the most active and enlightened forces; it originated all new developments and exercised full legal control, having by then fully absorbed in one institution both the tradition of the workshop and the authority of the guild, though in some places the latter continued to exist. The extreme suitability of the academy to that particular time in history is shown by the rapid increase in numbers which occurred in the space of a few decades in Europe and America and is recorded in the following foundations: (*a*) Germany: Mannheim, 1752; Bayreuth, 1756; Mainz, 1757; Stuttgart, 1762; Leipzig, 1764; Düsseldorf, 1767; Munich, 1770; Oehringen, 1771; Erfurt, about 1772; Hanau, 1772; Zweibrücken, 1773; Weimar, 1774; Kassel, 1777; Frankfurt, 1779; Halle, 1780; Karlsruhe, 1786; Gotha, 1787; (*b*) Italy: Venice, 1750; Genoa, 1751; Mantua, 1752; Naples, 1755; Parma, 1757; Verona, 1763; Carrara, 1769; Milan, 1776; (*c*) France: Montpellier, 1738; Rouen, 1741; Reims, 1748; Beauvais, 1750; Toulouse, 1750; Marseilles, 1752; Lille, 1755; Lyons, Nantes, Le Mans, 1757; Amiens, 1758; Tours, 1760; Grenoble, 1762; Aix, 1765; Saint-Omer, 1767; Dijon, 1767; Arras, 1770; Douai, 1770; Poitiers, 1771; Troyes, 1773; Besançon, 1773; Bayonne, 1779; Châtellerault, 1782; Langres, 1782; Mâcon, Saint-Quentin, Valenciennes, 1783; Toulon, 1786; Orléans, 1786; *d*) Spain: Madrid, 1752; Valencia, 1753; Barcelona, 1775; Saragossa, 1778; Valladolid, 1779; Cádiz, 1789; (*e*) England: London, 1768; (*f*) Holland: The Hague, 1750; Amsterdam, 1758; Rotterdam, 1773; (*g*) Belgium: Ghent, 1750; Tournai, 1756; Malines, 1761; Brussels, 1763; Liège, 1773; Mons, 1781; (*h*) Switzerland: Geneva, 1751; Zurich, 1773; (*i*) Mexico: Mexico City, 1785; (*j*) United States: Boston, 1780; New York, 1802; Philadelphia, 1805.

The instruction given in European academies well into the 19th century, however complex and well-organized, remained essentially faithful to the programs of the 16th and 17th centuries. Most of the course consisted in the study of works of art and was thus antiquarian, humanistic, and secondhand; imitation of classical art was still fundamental, even though it was integrated with life drawing. The reaction against this type of teaching began in Germany and can be considered a reaction of the romantic spirit against the intellectualistic attitude of the preceding age. In place of the analytical method of study used by the copyist, the romantics stressed the pupil's need for imaginative freedom. A desire to revise the traditional scheme was already part of the thinking of Johann Friedrich Overbeck, but the first practical expression of this reaction occurred in the Munich academy, where Johann Peter von Langer (director of the Munich academy until his death in 1824) and (after 1824) Peter Cornelius replaced the pedantic study of drawing after casts with a more direct method and a greater emphasis on color at the expense of drawing, which previously had been regarded as fundamental. Similar ideas also inspired the teaching of J. L. David (q.v.) at the Ecole des Beaux-Arts in Paris; David gave individual attention to his pupils, avoiding the disadvantages of the traditional system whereby students were taught by a large number of continually changing masters. Further innovations were made in the Düsseldorf academy, directed by Wilhelm Schadow (the successor in 1826 of Peter Cornelius, who had directed both the Düsseldorf and the Munich academies). In an attempt to remove the often excessive ascendancy of the teacher over the pupil and to create that community of works and aims cherished by

the Nazarenes as a romantic revival of the medieval workshop, there was instituted at the school a *Klasse der ausübenden Eleven*, in which the pupils spent five years in elementary courses and subsequently participated in the work of their master, attaining "that freer development which is produced by the interaction of different individual faculties and tendencies." But if "the Nazarenes dreamt of the spirit of community . . . what they were bound to attain was only the destruction of . . . collective education and the establishment of a purely individualistic system" (Pevsner, 1940).

With the advent of impressionism there was a general revolt by artists against the traditional methods of instruction; the impressionists emphasized the necessity of individual freedom and regarded all externally imposed laws as intolerable. As a result of this attitude art teaching began to be conceived of by some not as a means of intellectual discipline or as training in taste but solely as the handing on of certain technical skills.

After the middle of the 19th century dissatisfaction with the teaching given in the academies became widespread. In Italy, for example, there was a general demand that all academies be turned into schools of applied or industrial art and that architectural training be reorganized and taken out of the hands of the academies. (For fuller discussion of art teaching in the United States, see IV, col. 567 ff.)

ORIGIN AND DEVELOPMENT OF MODERN CULTURAL AND RESEARCH ORGANIZATIONS. For many years the study of art history was associated with the academy of art, which thus fulfilled a double function — that of producing artists and that of improving the level of art-historical education (even if on a somewhat limited scale). Historical problems, in which the fine arts were often involved, were really within the scope of the academies or institutes of science, letters, and the arts which — under various titles and involving either strictly local or more extensive fields of study — had come into being in Europe from the 16th century. The earliest bodies of this type were founded in Italy, and their number continued to increase until the end of the 19th century (Vicenza, 1555; Lucca, 1588; Acireale, 1671; Modena, 1683; Palermo, 1718; Naples, 1752; Venice, 1802; Arezzo, 1810; and others). From Italy they spread to all of Europe (e.g., Académie des Inscriptions et Belles-Lettres, founded in Paris in 1664) and then to America, where the academies of Boston (1780) and Philadelphia (1805) were established. In the second half of that century, however, the study of art history began to break away from these academies; the main cause was the founding of a series of organizations devoted to the study of ancient history and the new science of archaeology. As early as 1727 the Accademia Etrusca of Cortona, an institution of relatively modest ambitions, began to collect archaeological remains (as well as paintings of the Tuscan school) and actively promoted studies of ancient history of more than local relevance. In 1740 Pope Benedict XIV founded in Rome the Accademia di Storia Romana e Antichità. This academy, which derived its inspiration from the 15th-century Accademia Pomponiana, had about thirty members who met monthly on the Campidoglio and lectured in turn mainly on historical subjects. The academy also sponsored discussions and publications. Its activities ended in 1757, but in 1810 it was revived through the enthusiasm and energy of the Frenchman J. M. de Gérando, who became its first president (its second was Canova). The revived academy had its own statutes and an academic body of 110 members, consisting of regular, honorary, and corresponding members (the latter numbered 40 and were drawn from the rest of Italy and from abroad). Through meetings and correspondence it practiced the international cooperation later continued by another Roman organization, the Istituto di Corrispondenza Archeologica (now the German Institute) founded by E. Gerhard. The academy, which met first in the Palazzo Corsini, on the Campidoglio from 1811, and finally in the Cancelleria (where it still meets), was at first financed by France but after 1816 once more received papal support. Its activities included the awarding of quadrennial scholarships and the publication of numerous works (the *Atti* of 1821, and subsequently *Dissertazioni*, *Rendiconti*, and *Memorie*). In comparison with the 18th-century academy, the scope was widened to include ancient history, archaeology, and the largely ignored period from the Middle Ages to the beginning of the Renaissance. The interest in Greece evident as early as the second half of the 17th century, together with the first excavations undertaken in Italy (ca. 1710), led to the founding in London (ca. 1733) of the Society of Dilettanti, which organized studies and excavations in Athens and Asia Minor, especially after 1764; in Naples, Charles III of Bourbon instituted in 1755 the Società Ercolanense with the intention of developing the archaeological researches he had initiated in the area of Herculaneum.

The diffusion of the theories of Winckelmann, the founding of museums (the earliest of which, the British Museum, dates from 1759), and travels and excavations in the East all contributed to the creation of various institutes of archaeology, the most important of which, throughout the first half of the 19th century, was the Istituto di Corrispondenza Archeologica, founded in Rome in 1829. Subsequent foundations include the Association pour l'Encouragement des Etudes Grecques en France, of Paris (ca. 1850); the Society for the Promotion of Roman Studies, of London; and the Society for the Promotion of Hellenic Studies, also of London (founded in 1879). In the middle of the century there was founded the Ecole Française d'Athènes (1846), the first of a series of schools established in Rome and Athens by various countries.

Since the end of the 19th century the study of classical and modern art has been conducted by university institutes or by specialized bodies of an international character. Notable examples of the former are the Warburg Institute and the Institute of Classical Studies, both of London; of specialized bodies, the Institutes of Archaeology and History of Art of Paris and Rome are noteworthy. All these bodies possess libraries and collections of photographs and sponsor lectures, courses of instruction, and publications. There are in addition many institutes dedicated to particular fields of study. There are those concerned with Oriental studies (School of Oriental and African Studies, London; Oriental Institute of the Deutsche Akademie, Munich; the Oriental Institute of the University of Chicago; the Società Asiatica Italiana, founded in 1886; the Istituto Italiano per il Medio ed Estremo Oriente, Rome) and those devoted to local or national fields of inquiry (for example, in Italy, the Istituto di Studi Etruschi ed Italici, of Florence, which since 1926 has acted as coordinating body for studies on Etruscan civilization; the Centro Nazionale di Studi sul Rinascimento, Florence; the Società Magna Grecia, Rome, which is concerned with the ancient history of Sicily and southern Italy; the Istituto di Studi Romani, which studies Roman history and art; and the Fondazione Giorgio Cini, of Venice, which promotes in various ways the study of Venetian culture). Wherever the possibilities of study are greatest (Rome, Athens, Spain, some Eastern countries), there are numerous institutes for the study of culture, founded since the middle of the 19th century and fulfilling the role once occupied by the school for artists studying abroad. In these new institutions, as in the old, there are places for scholarship students. In Rome there are many such organizations dedicated to the study of archaeology and history of art with regular publications containing the results of their activities: the Academia Belgica, the American Academy in Rome (incorporating since 1913 the American School of Classical Studies, founded in 1894), the German Biblioteca Hertziana, the British School at Rome, the Danske Institut for Videnskab og Kunst i Rom, the Deutsches Archäologisches Institut, the Ecole Française de Rome, the Escuela Española de Historia y Arqueología en Roma, the Institutum Romanum Finlandiae, the Istituto Svizzero di Roma, the Nederlands Historisch Instituut te Rome, the Österreichisches Kulturinstitut in Rom, and the Svenska Institutet i Rom. Similar institutes exist in many other cities: in Florence, for example, there is the important Kunsthistorisches Institut; and in Athens, where institutes are active in the work of excavation, are found the American School of Classical Studies at Athens, the Ecole Française d'Athènes, and the Scuola Archeologica Italiana di Atene; and in Beirut is the Institut Français d'Archéologie.

SCHOOLS AND MUSEUMS OF INDUSTRIAL ART. In the second half of the 18th century, as a result of an impressive expansion in the crafts, another group of schools came into existence; their purpose can best be described as commercial. At Hagedorn, Meissen, and Leipzig (all in Germany) schools of art were started specifically to study particular spheres of industrial activity (such as pottery or printing) in which art played an important part; in addition, this ground was partially covered by departments of some of the academies of art, such as those of Berlin, St. Petersburg, Copenhagen, The Hague, and Dublin. In Naples three institutes of this kind, real centers of research in the applied arts, were founded during the reign of Charles III of Bourbon; these were the Reale Laboratorio degli Arazzi (1737), the Reale Laboratorio delle Pietre Dure (1738), and the Fabbrica di Ceramiche of Capodimonte (1739). Other important foundations were the Manufaktur Schule of Vienna, the Handwerkerschule of Karlsruhe, and the Ecole Royale Gratuite de Dessin of Sèvres, which opened in 1767 with 1,500 pupils. In all these schools artistic instruction consisted mainly in copying from drawings and prints and in the study of ornamentation, flowers, animals, and geometric motifs. In this new development, however, the greatest impulse came from France and England, the principal centers of that process of industrialization which was to transform the crafts. In the second half of the 18th century were founded the Paris Ecole des Ponts et Chaussées (1747) and the Ecole Polytechnique (1794); openly at variance with the Académie des Beaux-Arts, these schools reacted against the traditional concept of architecture and concentrated their attention on specific structural problems. The Conservatoire National des Arts et Métiers (founded 1794), though dealing with problems faced earlier by the German schools, tackled more realistically and on a larger scale than before the difficulties blocking the spread of knowledge about mechanical and industrial processes and those hindering the gradual transformation and expansion of small industries into large-scale production units. Apart from some rudiments of theory, the syllabus of the Conservatoire was essentially practical and included all the forms of craftsmanship suited to industrialization: metalwork, claywork (particularly as utilized in architecture), glass and mosaic work, textiles, typographical characters and printing in general, and engraving and photographic techniques. The instruction stressed the processes used in creating an object — glazing and firing a pot, fusing, blowing, coloring, and enameling glass — and gave a sound knowledge of the processes of stamping, rolling, pressing, and turning metals, of the mechanical working of various types of material, and of their decoration. The founding of the Ecole des Beaux-Arts by Napoleon in 1806 was a further step in the same direction. In England, too, though in a less organized and more experimental fashion, many branches of craft production, through the collaboration of designers and producers (e.g., John Flaxman and Josiah Wedgwood in the field of pottery), began to organize the means of mass production. The Great Exhibition of 1851, in London, confirmed the rivalry between France and England in this field and contributed to the development of industrial art in Europe, helping to bring about that linking of museums and schools of applied art which was the most significant development of the second half of the 19th century (Pevsner, 1937). This idea was originated by the German architect G. Semper; claiming that the machine was responsible for the decline of industrial art and wishing to improve and refine the sensibility of the working class, he suggested setting aside most of the exhibits of the Great Exhibition of London to create a permanent museum that would be a place of practical study where the variety of works of art would provide an abundance of excellent material to be copied and studied. The result of his plans was the creation of the South Kensington Museum of London, later renamed the Victoria and Albert Museum, which contained works of art and copies of works of art of the most varied nature and origin, ranging from wrought iron to the intricate woodwork of the façade of an English 16th-century house. From its foundation this museum had attached to it a school of design (for the applied arts), the purpose of which was to train teachers for local schools. This example was soon followed in Germany. In 1873 the Kunstgewerbemuseum was set up in Berlin, with a notable collection of jewelry, ancient fabrics, and pottery and with an associated technical school. Similar institutions were founded in Jessen, Karlsruhe, Cologne, and Hamburg, while the museum in Munich was devoted particularly to industrial art. In Vienna the important Österreichisches Museum für Kunst und Industrie was founded in 1844 to house collections of precious metals, works in bronze, china and pottery, furniture, miniatures, and leatherwork (an Oriental Museum was added shortly thereafter); it later included a school with courses in design, drawing, plastic arts, pottery, and wall decoration. Other institutions of this type included the Museum of Applied Arts in Budapest; the Museum of Industrial Art in Geneva, with an attached school and collections of fabrics, embroidery, lace, pottery, and weapons; the Bontowski Museum of Art and Industry in Moscow; and the Stieglitz School at St. Petersburg. An important French contribution to this large movement was the creation in 1865 of the Union Centrale des Beaux-Arts Appliqués à l'Industrie. This organization, which was founded on the initiative and through the support of private individuals, had a library specializing in art and industry, arranged competitions and prizes, organized exhibitions of the industries of countries throughout the world, and collected material for a museum of decorative art and for particular sectors of the minor or exotic arts (Oriental art, textiles and tapestries, metalwork, weapons, furniture). Other French schools strove for higher standards in various fields: the Ecole Nationale des Arts Décoratifs, which taught geometrical and architectural design, decoration, and human-figure and animal drawing; the school of Lyons for workers in silk textiles; the national training school for workers in the steel industry and in wood; and the two great organizations of Gobelins and Sèvres, which had benefited from the collaboration of Falconet, Boucher, and Van Loo. In Italy, too, this union of school and museum enjoyed some favor. An industrial museum was founded at Turin, and the purpose of the Museo Vetrario in Murano (founded 1861, school added 1864), was to improve the quality and quantity of the products of the glass and pottery industries, both of which had suffered a serious decline during that century. To promote the national solution of such problems a new central organization, the Regio Museo Artistico Industriale di Roma, similar to those existing in other countries, was founded in 1873 in Rome, once again the capital; in 1876 a small school was added, with courses in pictorial decoration, wax modeling, and metal enameling. In 1907 this organization was enlarged and became the Istituto Nazionale Artistico Industriale di San Michele. The exceptional number of schools and museums of industrial art which were founded in Italy in the second half of the 19th century resulted from the many ancient and varied traditions of local craftsmanship which these museums and schools were meant to defend and protect, rather than from the beginning of any real expansion on an industrial scale. These institutions were thus conservative in character and often somewhat provincial, an aspect which can be attributed to the political situation of the country, only recently united. One of the first schools associated with a museum was the Reale Istituto d'Arte, Naples (1880), attached to the Museo Artistico Industriale (1878); a speciality of this school was the continuation of the local tradition of ceramics. Other foundations were the schools in Massa (sculpture, 1852), Urbino (1861; since 1922 specializing in the art of bookmaking), Padua (1867), Sesto Fiorentino (ceramics, 1873), Venice (1873), Cortina d'Ampezzo (1874), Novi (ceramics, 1875), Torre del Greco (the working of coral, 1878), Lanciano (1879), Gorizia (1880), Verona (1881), Syracuse and Acqui (1882), Cantù (1883), Bologna (1885), Sorrento (inlay, cabinetmaking, 1886), Penne and Pesaro (majolica, 1887), Sansepolcro (1888), Castelmassa (1890), Cascina (woodwork, 1896), and Galatina (1897). These schools, some of which were part-time or for girls only, usually did not deal with general cultural subjects; the length of the course was three to five years and the age of entry twelve to fourteen years.

In the 20th century more schools were founded, including those in Faenza (1916), attached to the local museum; Castelli

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

(1906); and Civita Castellana (1913) — all for ceramics. In 1924 they all came under the control of the Ministry of National Education.

The great period of development for schools of industrial art throughout Europe has been the 20th century. Some of the main stages in this development were the Turin exhibition of 1902; the law dealing with the organization of German schools of industrial art (1904); the Deutscher Werkbund, started in Munich in 1907; the founding of the British Institute of Industrial Design (London, 1919), which supplemented an already existing Design and Industries Association; the founding of the Bauhaus (1919); the Deville reform of schools of applied art in France; the Triennale of Milan, which began in 1918 at Monza as a biennial of the decorative arts; and the Milan university for the decorative arts, founded in 1922 (later the Istituto Superiore per le Industrie Artistiche, functioning as such until 1940). The Deutscher Werkbund, founded by H. Muthesius, H. Van de Velde, T. Fischer, F. Schumacher, R. Riemerschmid, F. Naumann, and K. E. Osthaus, and led by T. Heuss, brought together artists, people in industry, and craftsmen and aimed at improving the quality of the artistic product through publications, teaching, and the organization of such exhibitions as those of Cologne (1914) and Stuttgart (Weissenhof quarter, 1927; participants including L. Mies van der Rohe, W. Gropius, B. and M. Taut, H. Poelzig, P. Behrens, R. Döcker, H. Scharoun, L. Hilberseimer, A. Schneck, Le Corbusier, and J. J. P. Oud). The influence of this movement on German domestic architecture, furniture, furnishings, and household utensils was of the greatest importance. The Werkbund — which soon had corresponding organizations in Austria (1912, Österreichischer Werkbund; prominent supporters were J. Hoffmann and O. Strand), Switzerland (1913, Schweizerischer Werkbund), and Prague — broke away from the Arts and Crafts movement begun in England by William Morris, systematizing his somewhat abstract ideas though upholding his concept of art as a collaborative venture in which all efforts are coordinated in order to achieve quality in industrial work. The program of the Werkbund was carried on in the Bauhaus, which was formed by the merging of two institutions already existing in Saxony, the Sächsische Hochschule für Bildende Kunst and the Grossherzogliche Sächsische Kunstgewerbeschule. The Bauhaus, a school of architecture and applied art, was founded in Weimar in 1919 by W. Gropius (q.v.), who directed it for the next ten years. Gropius believed that industry should evolve from and not destroy craftsmanship. ("A deliberate return to the old system of crafts would be a mistaken display of atavism. Today, the gap between the crafts and industry is closing; indeed, these two must gradually merge into a new unity of production, which restores to each individual his sense of collaboration in the whole. In this new unity, the crafts will provide the experimental side of industry, creating the standards for industrial production.") The school aimed at increasing, by means of the machine, the production of the old class of craftsmen. The machine, they maintained, need not alter the quality of the object as it leaves the craftsman's hands, but would simply permit its unlimited reproduction. It was one of the purposes of the school to accustom the craftsman to the use of the machine. The Bauhaus had about two hundred students, and its courses lasted three and a half years. The students began with manual and technical work (*Werklehre*), proceeded to work of a more formal nature (*Formlehre*), and terminated with architecture, which continually intervenes, "mediating and conditioning the vital relationship between man and reality" (Argan). The Bauhaus, which soon numbered among its teachers some of the best artists in the country (Klee from 1921 and Kandinsky from 1922), exercised a great influence on furniture, textiles, wallpaper, upholstery, and printing, and left its mark, too, on the theater and on advertising. In 1925 the hostility of certain reactionary circles — including traditional or conservative craftsmen, the civil service, and big business — forced the school to move to Dessau, and in 1933, after Gropius had been succeeded as director by Hannes Mayer and Mies van der Rohe, the Bauhaus was closed by the Nazis. The Bauhaus concluded the series of attempts made since the middle of the 19th century to reestablish contact between the worlds of art and production, to create a class of workmen who were also inventors of forms, and to base artistic work on the principle of cooperation. In its revolt against "pure" art, that is art conceived as a mysterious inspiration vouchsafed to only a privileged élite, it was "the last act in the struggle of romanticism against classicism; and at the same time an example of the practical approach, a reaction against the esthetic theories of idealism" (Argan). One of the features of the school was its emphasis on cooperation, apparent not only in the community life led by teachers and pupils, who spent their free time together in various cultural activities, but also in the direct participation of the students in the school council and in the cooperative designing of models sold to industry to help support the school.

In mid-20th-century France artistic education comes under the control of the Conseil Supérieur de l'Enseignement des Beaux-Arts, composed of members of the ministry of national education, of the staff of the undersecretary of state for the fine arts, and of the staff of the secretary to the academies of fine arts. This council controls about thirty regional and municipal schools of applied art — the principal ones being in Bordeaux, Marseilles, Nancy, Grenoble, Lyons, and Rouen — and in addition the national schools of decorative art at Nice and Dijon, the school of applied art at Bourges, and the Ecole Nationale Supérieure des Art Décoratifs of Paris. In Italy the art schools for craftsmen are divided, according to the regulations of 1924, into schools of art (elementary) and institutes of art (advanced), numbering together about sixty. In Germany, the tendency since the beginning of the 20th century has been to combine courses in fine arts, crafts, industrial design, and industrial production (*Fortbildungsschulen*, *Gewerbeschulen* or *Fachschulen*, *Kunstgewerbeschulen*, and *Kunstakademien*); the *Fachschule* embraces both technical and industrial schools, while the schools of arts and crafts cover more and more the fine arts. The ideals of the Bauhaus and the union of academy and school of arts and crafts in Berlin have been important influences in this direction. In England the opposite tendency has prevailed, and the schools there tend to specialize in particular branches of knowledge. Compared with their Continental counterparts, even the least advanced of these schools (for pupils from twelve to sixteen years) have more varied and extensive courses. The oldest (founded 1884 by J. B. Fletcher) and most comprehensive is the Birmingham College of Arts and Crafts, which is divided into two schools with three-year courses. A special school for jewelers was founded in Birmingham in 1890 by the Jewellers' and Silversmiths' Association. Other specialized schools are at Kidderminster (carpets), Stourbridge and Brierley Hill (glass manufacture), Walsall (leather and other skins), and Wolverhampton. Others include the Burslem Art School, Stoke on Trent (pottery), the Manchester School of Art (with about 1200 students; like other schools in Lancashire and Yorkshire it is primarily for work in textiles), the Leicester College of Technology and Commerce, and the Wycombe Technical Institute. In London the London County Council has 26 schools of arts and crafts with specialized courses; among them are the North-Western Polytechnic, the Chelsea School of Art (graphic arts), the School of Photo Engraving, the Hammersmith School of Building, and the Shoreditch Technical Institute. The only school of art run by the government is the Royal College of Art, which has five separate branches of instruction: architecture, design and craft, painting and drawing, engraving, and sculpture. The best students from these schools proceed to the Central School of Arts and Crafts, in London, an advanced school founded in 1896 through the influence of the Arts and Crafts movement. The courses which it offers are architecture, illustration and printing, furniture, fashion, carving, modeling, painting, metalwork, and stained glass. Some of these courses prepare pupils for entry to a trade, others to an industry; a special class comprising students drawn from various courses studies industrial design. The work of this educational system is supplemented by a series of associations. The British Institute of Industrial Art, an official body founded in 1914, devotes itself primarily to

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

the organization of exhibitions of arts and crafts and of industrial art. On the other hand, the Design and Industries Association (founded in 1915 on the model of the German Werkbund) and the Industrial Art Committee of the Federation of British Industries (established 1921), both private bodies, are principally concerned with educating the sensibility and taste of the purchasing public. The Royal Society of Arts, first founded in 1754, entered a period of decline in the 19th century but was revived in 1924 with its original purpose of encouraging collaboration between industry, commerce, and the arts, and thus benefiting British arts and manufactures. The Society of Industrial Artists (1930) had similar aims, while numerous exhibitions and publications (e.g., the periodical *The Studio*) helped in the task of educating the public. Even the Royal Academy held an exhibition of industrial art at Burlington House (1935). Similar organizations, though on a somewhat smaller scale, played a leading part in other countries. In Sweden, for example, the evolution of modern taste was in many ways determined by the influence of the Swedish Society for Industrial Design, founded early in the 20th century.

CONTEMPORARY DEVELOPMENTS. Several of the functions which once belonged to academies of art are now largely performed by museums or galleries of modern art. This is particularly true in the United States. The Cleveland Museum of Art, for example, relying entirely on private support, has a wide teaching program with courses for both young people and adults. Its Education Department, established in 1916, works with schools and groups organized according to the potential of the pupils. In addition, the Museum, whose courses are entirely free, collaborates with the University, with the Cleveland Institute of Art, and with other institutions, and plays an active part in the solution of such problems as urban development. American museums perform a leading role in bringing culture to the people and in experimenting with new educational methods, such as the mobile exhibition (e.g., the Artmobile, conceived and created in 1953 by the Virginia Museum of Fine Arts, Richmond), though certain European museums are also entering the field (e.g., the Ecole du Louvre in Paris). Attempts are currently being made to amalgamate the teaching activities of the museum (e.g., the J. B. Speed Art Museum of Louisville, Ky., and the New York Metropolitan Museum of Art) — now one of the most active forces in the community — with the similar activities of other institutions; the relations between these various bodies have been discussed at special congresses (e.g., Baltimore, 1949) dealing with elementary and secondary schools, colleges, universities, and technical schools, in addition to museums. Teaching activities also come within the scope of the College Art Association of America (which publishes the excellent *Art Bulletin* and the *College Art Journal*), an association which for a quarter of a century has linked art departments of colleges offering public courses aiming at "total education" — that is, balanced development, in what is virtually the old humanistic sense — of the individual and the community. These organizations, which attempt to combine the teaching of art history and criticism with the practice of art, have been influenced by the concept of "self-expression," which became popular about 1930 and was widely applied particularly in the teaching of art in the lower grades of the American school system. Although it is now generally acknowledged that this concept has little to do with art and functions primarily as an aid in the development of the personality, the tendency has spread. For example, in the state educational system of Mexico, the teaching of painting to young children was introduced by followers of the American educator John Dewey.

Another significant development in the last hundred years, in all fields of art, has been the frequency of national and international exhibitions. Some of these exhibitions, held at regular intervals in the same place, have acquired a certain autonomy and a definite line of development. Significant results have been achieved by the two largest Italian exhibitions of this kind, the Milan Triennale and the Biennale of Venice. The latter has become a well-known center for the study of contemporary art, possessing very complete photographic collections, publishing a periodical, and sponsoring other publications. The Triennale has had the greatest influence in Italy, being responsible for, among other things, the introduction of the current of functionalism. In 1949 it set up a Centro Studi Triennale, which specializes in modern art and is provided with a library, photographic collections, and various card indexes. The activity of the Triennale has also extended to the organization of congresses and to the construction of an experimental suburb on the outskirts of Milan.

One of the characteristic features of the mid-20th century is the tendency to create in every field national or international organizations, often under the patronage of the United Nations Organization, designed to coordinate the efforts of smaller bodies in specific fields. The purpose of these large organizations ranges from the safeguarding of professional interests to the promoting of educational aims and the conservation of works of art. In the field of conservation two organizations, the International Institute for the Conservation of Historic and Artistic Works, with headquarters in London, and the Istituto Centrale del Restauro, in Rome, deal with problems of restoration on a national and international level and are at the head of modern developments in this area, owing to scientific methods of work and up-to-date laboratory equipment. Attached to the Istituto Centrale of Rome (now under United Nations patronage) is an international school for the restoration of works of art. In France in the field of photographic documentation all the material concerning national monuments and works of art is centralized in the Archives Photographiques in Paris. Museums, too, have organized associations in which a large number of museums are represented and which function as research centers, some with the sole purpose of protecting the national artistic and cultural heritage (Associazione Nazionale dei Musei Italiani); others have broader functions — educational, for example (American Association of Museums). This tendency toward collective organization can be seen in every field: for example, all the institutions in Rome concerned with historical and artistic studies set up in 1945 a Union International des Instituts d'Archéologie, d'Histoire, et d'Histoire de l'Art, with headquarters in Rome. This collaboration has permitted the publication of the Biblioteca Historica Medii Aevi, of a catalogue of classical sources in Roman libraries, and of *Fasti archaeologici* (published by the Associazione Internazionale d'Archeologia Classica), and has also made possible the establishment of a photographic library of ancient Italian architecture and topography and of a similar library of post-antique art. The various activities of these bodies include the spread of modern tendencies and ideas (e.g., the Société Belge des Urbanistes et Architectes Modernistes, the Federazione delle Associazioni Italiane per l'Architettura Moderna, founded in 1950 in Milan) and more general cultural and professional pursuits (e.g., in the field of architecture, The Royal Institute of British Architects, the Union of Architects of the Rumanian People's Republic). The International Council of Societies of Industrial Design studies the problems of this specific field of the arts. The Union International des Architects, which was set up in 1948, has wide artistic, technical, cultural, and social aims, not least among which is the safeguarding of the interests of the profession. The Union's work is divided among various committees which organize exhibitions and international competitions, sponsor studies on town planning and the building industry (with special reference to the building of hospitals), and discuss the architect's education, his position in society, and the protection of artistic copyright.

Giuseppe SCAVIZZI

CHINA. In the Asiatic world it was only in China that the primitive forms of association of artist and craftsman (of the sort discussed above under *Organization of Artistic and Craft Activities in Primitive Societies and in the Ancient World*) were followed by artistic institutions of some complexity, whose intellectual and social significance makes them in some way comparable to those of Europe. Precise information is available mainly for the art of painting, the only art that the Chinese regarded as great, all the other artistic techniques including

sculpture being considered on the level of crafts. At the court of the Southern Sung (12th and 13th cent.) there was the so-called "Academy of Painting" (Hua-yüan), to which professional painters at the imperial court belonged. Until almost the end of the Sung dynasty this academy was a part of the (literary) Han-lin Academy. The latter, founded in 754, had been open to painters as early as the first century of its existence; but in the reign of T'ai-tsu (960–76), of the Northern Sung dynasty, an Office of Painting was founded, subordinate to the Han-lin Academy and modeled on various private academies, not subject to government control which had flourished during the period of the Five Dynasties (907–60). However, some scholars (e.g., Yonezawa) would place the origins of the Hua-yüan in the T'ang period (618–906). Whatever its origins, this academy gradually acquired more and more autonomy. It was organized in four grades, was responsible for the teaching of painting, arranged competitions, and above all gradually developed what came to be called the academic style. The Mongols (Yüan dynasty, 1260–1368) at first took away the academy's independence and then in 1287 reopened it. It continued to exist under the two subsequent dynasties (Ming and Ch'ing) but never reached the standard attained during the Southern Sung period. Most of the great painters remained aloof, and the academy declined to a small institution of salaried painters charged with the supervision of works ordered by the emperor.

Schools of painting existed with varying degrees of success in every period, and the same is true for the other arts. The study of pottery reveals the existence of common characteristics due to the work of groups of potters operating at the same kiln; sometimes these characteristics are found in different localities, as in the case of potters who, because of Mongol pressure, emigrated to the south in the 12th century but continued to produce in their new home the same type of objects as before.

The establishment of the Republic (1912) saw the formation of the National Research Institute, known also as the Academia Sinica. This body, which coordinated scientific and cultural activity, is known chiefly for the important archaeological excavations which it carried out prior to World War II. After 1949 the old group of the Academia Sinica moved to Formosa; it has to its credit a number of important publications. In mainland China the Academy of Sciences was founded in 1949 and reorganized in 1955; it has four sections (mathematics, physics, and chemistry; biology, geology, and geography; technology; and philosophy and social sciences) and possesses all the characteristics of a national research institute. There also exists in mainland China a Union of Chinese Artists and an All-China Federation of Literary and Art Circles, founded in 1949.

Lionello Lanciotti

Principal organizations related to study of art and development of artistic activity. The following list is indicative of the variety of institutions and their activities in the field of art studies. For more extensive listings and later reorganizations, see the publications cited under *Inventories of institutes, organizations, and societies* in the bibliography. Years which follow the names of institutions are the dates of founding. The universities, with their institutes of archaeology, art history, architecture, ethnology, and so forth, are omitted for the sake of brevity: see *Minerva Jahrbuch der gelehrten Welt, Abteilung Universitäten und Fachhochschulen, I: Europa*, Berlin, 1952, *II: Ausseneuropa*, Berlin, 1956. Museums, many of which offer educational programs, maintain specialized libraries, and publish books, monographs, catalogues, etc., are more extensively treated under museums and collections.

Society for American Archaeology, Washington, D.C. (1945), pub. *American Antiquity*. Society of Architectural Historians, New York (1940), pub. *Journal*. Wenner-Gren Foundation for Anthropological Research (1941), New York. In the United States the equivalent of the European art academy has frequently developed as a department of a university (see V, col. 567). In addition, since World War II, privately endowed, nonprofit foundations (e.g., The Ford Foundation) have played a large role with grants for development in fields related to the arts, and many state and local historical societies (e.g., Pennsylvania, Massachusetts, New York) offer exhibitions, maintain libraries, and preserve monuments and objects of historical importance, some of which are also of artistic interest. Other organizations have been formed by various national and religious groups in the United States to gather and disseminate through their publications information about their particular cultures (e.g., American-Jewish Historical Society, founded 1892, New York; American Swedish Historical Foundation, founded 1926, Philadelphia).

INTERIOR DECORATION AND DESIGN. The art of interior decoration is fundamentally different from that of architecture (q.v.), for its problem is not the definition of interior spaces but their adaptation to human needs. To make this adaptation artistically it is necessary to consider the relationship between the room's decoration and its furnishings as well as the whole visual effect. In this respect, the art of interior decoration includes the art of furnishing but should be treated separately from such individual elements as furniture, household objects, and tapestry and carpets (qq.v.). Interior design directly and effectively reflects the taste of an epoch, a culture, a social group (even mirroring a tradition of a particular family), or of personal predilection. Although conservative in primitive societies and at the folk level, it changes rapidly, almost as swiftly as fashion, in more evolved civilizations. In some famous historic and public buildings, such as palaces and churches, interior design assumes a monumental role, and its history and development are recorded together with that of architecture.

SUMMARY. The art of interior decoration and its relation to architecture and furnishings (col. 183): *Structural and functional elements. The formal definition of interior space. The relationship to furnishings. Design.* Historical development (col. 189): *Primitive interiors. Antiquity. The West. The East: a. The Iranian, Indian and Islamic world; b. China; c. Japan. Modern interiors.*

THE ART OF INTERIOR DECORATION AND ITS RELATION TO ARCHITECTURE AND FURNISHINGS. Because it echoes concepts not only of nature but also of life and social customs, the treatment of interior space differs greatly from civilization to civilization, and, within each civilization, from place to place and from class to class. Interior spaces are to a certain extent planned, arranged, and articulated at the moment of architectural conception. Except in very important buildings designed for public functions, the final determination and formal modification of interior spaces depends in large part upon the initiative and taste of the craftsmen — the cabinetmakers and stuccoworkers, for example — and upon the users themselves. In most cases the interior space reflects, in its formal configuration, the general attitudes and ideas concerning the space outside. This is true whether the limits of the space enclosed are enlarged by creation of a relationship between interior and exterior space, or whether there is an attempt to eliminate all apparent connection between them, thereby emphasizing the seclusion and privacy of an enclosed space. It must be noted, however, that while creation of such a relationship is often explicitly attempted or avoided in the actual construction of the buildings, in many cases it is produced, completely or in part, by psychological means and at times even by optical illusion. As a result, the outside space, observed as part of the space inside, is regarded not objectively but as space seen or imagined by a person within the room; even if the view of the outside is constantly seen from within, it is effective only in that it appears beyond the wall, inscribed inside the geometric form of a window, like a picture within its frame.

Unless the area concerned is to be set apart from worldly contact for ritual or functional reasons — as, for example, a tomb — the architectural designing of an interior almost always presents the same problem, which can be separated into the following aspects: (a) the determination of size and proportion, (b) exposure (ventilation, insulation, etc.), (c) functional distribution and articulation of the rooms, and (d) definition of form. Since the first three of these aspects are treated in the articles on TOWN PLANNING, ARCHITECTURE, and STRUCTURAL TYPES AND METHODS, the discussion here will be limited to the last.

Within the subject of enclosed space, or inhabited architecture, a distinction should be made between (1) functional aspects, in so far as they determine the size, the proportions, the distribution of rooms and their form, and (2) decorative aspects, in so far as these are conditioned by function, even though some elements may fall into both categories. Included in the first category — the functional aspects — are all the structural elements, whether their purpose is to delimit or to support, that receive formal definition in the interior (such as walls, piers, and columns); elements of communication between interior and exterior space (such as doors and windows); interior structural elements meant to subdivide the interior space or to determine, within the room, areas assigned to different functions; and elements that articulate or connect (such as stairs and corridors). Into the second category — the decorative aspects — fall elements of architectural decoration, hangings and wallpapers of various types, furnishings, furniture, and household objects.

Structural and functional elements. An essential factor in the shaping and determination of interior space is the treatment of the defining planes, or more specifically, the building plan. The structural plan is important not only because it pertains to the distribution of supports bearing the building's weight and the effective use of spaces for their specific purposes, but also because it is the essential agent in determining the size, proportions, modulation, and design of the space. However, the spatial limits of the plan may be integrated and modified by accessory elements, such as partitions, fixed and mobile dividing walls, screens, hangings, railings, balustrades, and by surface decoration.

Structural elements, even if common to both the exterior and interior of a building, generally have a different appearance inside, where material and ornamental forms are more delicate and more suitable for close viewing. Not uncommonly such elements assume symbolic significance, at times intentional, at other times unconscious. Illustrating intentional design is the decoration of domes with figures alluding to the heavens (in the physical, cosmological, astrological, or religious sense) and the decoration of columns and piers so as to suggest that they are supports not only of the physical building but also of the building as an idea, a spiritual construction. Less meaningful or even unconscious is the mental association of the wall with the horizon — a basic theme in wall decoration, though diversely expressed in different times and cultures.

Interior space in its actual or imaginary relationship to the outside is determined by the necessity for shelter from the elements and for the protection of property, the need for privacy, and the possibility of modifying this relationship according to circumstances. The size of openings to the outside and of such protective and screening devices as gratings, railings, shutters, blinds, and transparent or opaque curtains, is also governed by these factors. Besides serving a decorative function, achieved largely through the effects of transparency and diffusion of light, these devices affect the character of the ensemble, since they determine conditions of illumination. Doors, as building entrances, have symbolic and ritual significance, emphasized by the kind of decorative motifs used (often the permanent, stylized versions of ornaments first placed there on solemn or festive occasions); interior doors between rooms also retain a decorative character, frequently augmented by the use of frames of special materials, drapes, and especially by ornamentation of the doors themselves, which are often painted, carved, or inlaid. Molding, acting as surface delimitation or connection, is an element of caesura and of plastic unity; its function is fulfilled even when the molding is reduced to a mere painted trimming and becomes

UP State Museum, Lucknow

intensified when contact with openings (such as doors and windows) is made. The architecture of the Renaissance reveals full awareness of — almost to the extent of theorization about — this function of articulating the relation between surface and void, for the molding of that period is clearly a plastic and spatial entity which establishes the perspective of openings in relation to walls. This may help to explain why the decoration of doors and windows, since the Renaissance, emphasizes perspective, as if to suggest the deep space beyond the closed door by the decoration on its surface.

Another functional element frequently developed for its great decorative value is the stairway. Structurally, its rapidly diminishing perspective presents a view that adds an element of variety to the building, in the context of more stable views. Decoratively, there often develops a complex idiom, generally based upon suggestions of perspectival recession or upon effects of movement.

The arrangement and decoration of interior spaces is particularly important in the areas for special family or social functions such as eating, receiving guests, worship, and study. The *studioli* of the Renaissance (PLS. 100, 103) and the boudoirs of the 18th century (PL. 108) are typical examples of rooms whose decoration alludes to or comments on their particular function. Areas and objects which are directly or indirectly considered symbolic because of their importance in social and family functions (their significance indicated by their shape or placement) include fireplaces and large, decorated, built-in stoves, and the bedroom and bed, which is often raised on a platform, isolated by curtains or a balustrade, or placed in an alcove (PLS. 100, 104, 108, 109). The placement, almost always permanent, of such objects in a room constitutes an important factor in the organization of space, which is also affected to a great extent by the interrelationship, sometimes preplanned, of the principal pieces of furniture.

The general shape of some interiors is linked, through practical necessity or by custom, with their specific functions; for example, the need to obtain a perfect and uniform transmission of sound and to permit the convergence of all lines of vision on a given point determines the form of the spatial cavity in theaters (PL. 106) and auditoriums (see ACOUSTICS) and in certain types of religious and public buildings. A more direct structural relationship between interior and exterior is established when the interior of an edifice is not subdivided, or when one space clearly predominates over other accessory spaces because of the public character of the building's functions, as in the case of churches, theaters, and government buildings. In these interiors the furnishings are generally determined directly by the architecture or are integral parts of it. Special planning for a specific type of building is also found in modern structures such as stations, offices, factories, and laboratories, in which function dictates unusual forms, offering extraordinary opportunities for the architect's imagination.

The interior furnishings of some vehicles, such as carriages and ships, are derived from those used in buildings. The need to concentrate equipment and furnishings within a small area and to protect them during movement, plus the use of materials such as wood and metal instead of masonry, endow these interiors with a special character and style of their own. These qualities are in turn reflected in architecture, which has been known to imitate, for example, the wooden stairs, galleries, and furnishings of a ship. Northern countries, especially the Netherlands, occasionally utilize such motifs in city dwellings and lodging houses.

The interior design and decoration of modern vehicles such as trains, ships, planes, and submarines becomes ever more difficult because of the specialized problems involved. The solutions — which may involve opening, reducing, or eliminating apertures, increasing or reducing the visible exterior, outfitting the space normally or eliminating the usual furnishings — are sometimes quite different from those developed for houses. Because it is completely bound up with technical, functional, and industrial problems, the structure and furnishing of such interiors has generally become the province of industrial design (q.v.).

The formal definition of interior space. The demarcation of interior space in architectural design is determined by a combination of factors, besides structure and function, that vary considerably according to culture and period but reflect, to a great degree, the relationship of the individual to his natural and social environment. This relationship can be expressed through various sculptural and pictorial techniques and materials and can be classified according to the use and type of delimiting surface involved: wall, ceiling, or floor.

Apart from being flat, curved, or, more rarely, irregular (its structural treatment dictated by the ground plan), the wall is normally a surface which can be embellished by descriptive or ornamental decoration executed in fresco or in stucco, or by objects attached to it, such as hangings, tapestries, paintings, reliefs, wallpaper, trophies, weapons, or arms. Wall decoration generally tends to create either of two effects: an illusory expansion toward outside space, canceling, so to speak, the limitation of the wall; or, quite the opposite, spatial segregation by accentuating that limit. In either case, there is usually an attempt to create a logical relationship between the structure and the wall decoration, achieved either by means of actual or simulated architectural supports and joints or by dividing the surface of the wall into variously proportioned and combined areas.

In producing the first effect — illusionistic expansion beyond the wall — the representational elements are the usual ones for simulating space: bands, cornices, or simple frames imitate in a more or less conventional manner an opening in the wall, beyond which appears further space — which may be architectural, naturalistic, or imaginary — with or without representation of figures. Sometimes one room seems to be followed by other, entirely imaginary rooms, set in perspective and often depicted full of people. In modern design, the wall is frequently covered with mirrors that seem to do away with the wall by reflecting the space within the room. Occasionally the illusion is carried to the point of simulating a completely different environment from the actual one. For example, a closed room may be transformed, by use of naturalistic decoration, into an open setting, a garden, a wood, or an arbor. The architectural design of the actual room may also be transformed by creating views into space or by using the artificial perspectives of theatrical scenography. Even when they are not meant to create the illusion of another environment, the most common ornamental motifs, predominantly geometric or floral in pattern, allude, sometimes only indirectly through stylized forms, to the fundamental contrast existing between architecture and nature. One of the most interesting features of wall decoration is the spectacular display of the imaginary and the inventiveness with which it is represented, making illusion almost an end in itself. Painting not only can simulate marble, wood, and textiles, and suggest landscapes and fantastic scenes, but can even imitate in chiaroscuro works of art made in other media, such as reliefs, statuary, and tapestries. There are even descriptions by ancient writers, both Western and Eastern, which emphasize the importance of the illusory artifice that, revealing itself as such, excites admiration but simultaneously destroys the efficacy of the illusion.

A particular type of wall decoration that is important because of the number and quality of examples of it and because it occurs in almost all cultures, is the large mural scene, often executed by the greatest masters. Because of their fixed position or by means of actual or simulated architectural forms, these representations are bound to the interior space of a building; although viewed naturalistically, they are not intended as illusory devices but as representations of religious, historical, secular, mythological, or commemorative scenes. Despite the fact that these depictions may be conceived as fantastic apparitions, as fictitious narrative, or as simple scenery, they are meant to edify and to instruct. The association of such representations with architectural space is of interest because this space is thought of as idealized, as a place in which miraculous and edifying events may be seen. The very fact that a fresco occasionally simulates a panel or relief confirms its character as an ideal representation in ideal space.

At the opposite extreme is spatial definition of walls without the use of representational elements. This category includes walls flatly painted in one color and with extremely stylized figural elements or with none at all, as well as modern wallpapers and wall paints whose rough texture, intricacy of design, and interlacing of lines and colors help to suggest a more or less definitive space that destroys the rigid limit of the wall and the visual impenetrability of the surface.

Accentuation of spatial delimitation, especially desirable for endowing small rooms with a character of intimacy or isolation, is obtained largely by using heavy ornamentation and drapery or facing that invites close inspection of the precious materials and fine workmanship involved. While the decoration of a large space normally has some connection with the architecture, or at least enters partly into the planning of a building, the decoration of a small space allows for better use of the various minor arts and is more immediately influenced by fashion, often because of the direct intervention of the client.

More than any other element within a room, the ceiling retains obvious traces of its architectural structure; not only are the vault and the dome undisguised structural forms, but even a flat ceiling often manifests more or less openly, at times by simulation, the structure of its beams. Great variety exists in the modes of spatial representation on ceilings. There is a kind of spatial reversal in certain Etruscan tombs that show the ceiling decorated with the tiles and the climbing plants that would ordinarily be visible on the roof outside. Classical coffered domes, so widely used, create effects of upward perspective movement. Almost inverting such an effect are Islamic stalactite ceilings, which hang down to fill the room space. Finally, the illusionistic decoration of Renaissance and baroque vaults frequently extends the architectural space of the room upward toward an imaginary opening to the sky. The tendency to cancel the ceiling entirely prevails over the opposite tendency, to weigh down and intrude upon room space; a culmination point of the trend to extend the ceiling is reached in baroque vaults that seem to pierce through the roof to reveal the heavens and their glories (PL. 105), almost transforming the interior of the architectural structure into an ideal space directly communicating with the metaphysical space of the paradise beyond.

No less complex is the treatment of the base level or floor, though the implicit reference to the ground generally renders any perspectival allusion to depth inappropriate. The technical and functional requirements — themselves a rather broad area of consideration — occasion the use of all manner of materials and techniques, ranging from marble slabs to inlays of colored marble, from brick work (recalling the primitive flooring of beaten earth) to ceramic tiles, and from mosaic to wood variously worked. In the spatial composition of a room, the floor is in direct relationship to the ceiling, often repeating or freely varying in its configurations the ceiling's structure. Moreover, whether they follow a rhythmic or a linear, perspectival sequence, the divisions of the flooring can compress or expand the movement of spatial recession and thus even alter the apparent size of a room.

Psychologically, the floor is best rendered as a level plane and therefore is commonly decorated with geometric ornamentation and motifs, such as meanders and palmettes, that are strongly stylized and repetitive, but naturalistic elements (floral patterns suggesting a garden, for example) are also frequently used. Designs colored and stylized so as to suggest carpets are not uncommon, for carpets are a natural complement to the floor and, especially in Islamic countries, constitute its essential decoration. The need to retain the level appearance of the floor prevents the development of extensive narrative and naturalistic representation in floor decoration. This type of embellishment is also impractical because the floor can be seen only at close range and from a single point of view, which excludes any view of the whole and presupposes that the spectator moves on the same plane as the representation. Hence, floor decoration is generally limited to representations that are divisible (even though linked and continuous), limited in area, and usually enclosed within rectangular or round borders, and tends to have a symbolic or emblematic rather than narrative theme.

The relationship to furnishings. Fixed furnishings are an important element in the determination of interior space. Regardless of the material, which varies according to use, period, or culture, furnishings that are an integral part of the interior — for example, shelving and cabinets in libraries; choir screens, confessionals, stalls, and singers' galleries in churches; and shelving, cabinets, and partitions in modern homes and offices — are either absorbed into the architectural concept of the building, or, occasionally, made part of a scheme that is intentionally decorative. They are even at times designed to assume a predominant role in the entire spatial definition of the interior, as in many German and Italian baroque libraries, and in sacristies, where the walls are almost entirely covered by tall cabinets that are treated as an integral part of the architecture. Occasionally, fixed furnishings used for religions purposes, such as choir screens, cathedras (or episcopal chairs), and pulpits, become the center of interest within the place of worship, a significant interruption in the perspective of the nave; furnishings decorated with inlay work in Early Christian basilicas and with Cosmati work in medieval churches provide examples. At other times, such furnishings assume symbolic significance, as in the Old Sacristy of S. Lorenzo, in Florence, where a marble table in the center of the room emphasizes the geometric rhythm woven into the entire architectural composition. Common to both medieval and Renaissance interior decoration were wooden high-backed seats, set against walls, that served as benches, chests, and stalls. These marked off a clear division of the space into two parts, one area meant for use and another for mural decoration. Today fixed furnishings are usually considered part of the total design of the entire structure and, with the disappearance of the wall as a dividing member, these furnishings themselves become necessary elements in the subdivision of usable space, as, for example, dividers used in the home between living room and kitchen, entrance, or study, and partitions erected between the various parts of a modern office. At the same time an ever more limited role is assigned to mobile furnishings, which by their nature are less bound to the plan and structure of the building.

It is also true that the form which interior space at various times assumes has profoundly influenced the shape of furniture. Indeed, it would be possible to categorize all furniture according to two extremes: maximal or minimal occupation of interior space. In contrast to the light, inconspicuous furniture that fits appropriately into the clear, defined, and proportioned rooms of the Far East, the architectonic furniture of the Renaissance concretely occupies an interior space, assuming its lines and proportions, while the massive furniture of the baroque actually dominates its spatial environment. Modern furniture, on the other hand, tends to be linked with architecture because of the linear and structural character common to both; its design adheres primarily to function, secondary consideration being given to pure style and form, while the bright colors of its upholstery enliven the room. The modern concept of relating furniture to architecture evolved in part as a result of the progressive decline of craftsmanship and the parallel rise and development of industry; the standardized products of industry issue from a kind of planning that is akin to and consonant with that of architecture. The variety of furniture types is reduced to a few elements uniform in character, able to serve a wide variety of functions and to fit conveniently into the small interiors typical of modern buildings. Because of such standardization of furniture types, corresponding to a standardization of rooms, the participation of the user in arranging the interior space is decreased. This frustration of personal control is in part the cause of a misunderstood reevaluation of "period styles" that exists to a certain extent in modern society and an accompanying propensity for mixing styles and for antique collecting. Furniture from different periods is often combined, especially in the home, but it requires a well controlled creative imagination and a well oriented personal taste to obtain good results.

Design. The problem of consciously relating the actual architectural plan to the formal definition of interior spaces

UP State Museum, Lucknow

is a relatively recent one. The traditional architecture of the Far East and especially of Japan, which emphasizes continuity between exterior and interior space, has supplied modern architects with a precedent to which they have willingly turned. In the West the first indications of a conscious, programmatic effort at formal definition of interior space are found in the 16th century, when Sebastiano Serlio studied architectural forms for fireplaces, doors, and other elements. This new interest continued to develop through the 18th century, especially in France, and by the beginning of the 19th century even the design of furniture, in keeping with the neoclassical principles of the Empire style, had developed a clearly architectural character (PL. 118).

Owing to such factors as the decline of craftsmanship, the transfer of furniture production to industry, and especially the new conception of architectural space, the approach to interior design has taken a decisive turn in the 20th century. The new conception completely eliminates the traditional distinction between a receptive space and the object contained within it, for it is founded on the principle of unlimited divisibility and, therefore, continuity of space (PL. 116).

The conscious distinction between exterior and interior accosdingly loses all validity. In ever-increasing use are large window surfaces that almost completely destroy the wall and change the interior into a volume of light, establishing full equivalence and a virtual reciprocity of view between inside and outside. Even elements of light control tend to pass from the category of accessories to that of structure, as in the case of the *brise-soleil*. In turn, modern architectural practices, eliminating the carrying function of the wall, permit maximum flexibility of plan and hence the modification of interior spaces according to the practical needs of the inhabitants. On the one hand, there is a tendency to incorporate furnishings into the architecture, both through built-in elements (often provided for in the floor plan) and as a result of the progressive standardization of furniture through mass production. On the other hand, the adoption of functionality as the determining factor in the definition of form has led architects to concentrate their attention on interior space, which is no longer derived from the exterior structure, but itself now determines the entire structure. Consequently, the exterior becomes only a projection of the interior space, or a natural boundary to it.

Giulio Carlo ARGAN

HISTORICAL DEVELOPMENT. *Primitive interiors.* Among prehistoric and primitive cultures there is no single criterion for the planning of the interior. While the structure of the interior is always conditioned by the external form and particularly by the degree of permanence of the dwelling, the interior decoration and design are determined primarily by economic factors, by social requirements, or by the symbolism characteristic of religious beliefs. Since these factors vary considerably from culture to culture, the amount of architectural elaboration and the richness of furnishings are equally varied. Furnishings are, moreover, often found only in an embryonic stage, and thus the analysis of primitive interiors tends to be confined to an examination of the architectural elements.

In some types of fixed habitation, especially in the long houses of the Salmon River Indians and the assembly houses and the men's houses in Micronesia and Melanesia, the architecture of the interior functionally predominates over the furnishings. Carved or painted posts and panels, decorated lofts, platforms running along the walls serving as bed niches, and benches are incorporated into the structure of the building or cut out of the walls; these complete or, more often, take the place of modest furnishings. However, in impermanent dwellings and particularly in tents, the plan and subdivision of interior space is not determined by the architectural structure or its fixed furnishings but by mobile elements such as mats, trellises, curtains, carpets, and skins, all occasionally decorated with great artistic imagination (PL. 91).

It would be impossible, generally, to discuss interior design if only the economic system of a particular people and the external shape of their dwellings were considered, but an exception to the rule must be made in dealing with the rather simple dwellings of hunters and gatherers in tropical and subtropical regions. These are simple sheds or beehive structures in which the definition of the interior space is determined completely by the form of the external covering. The simplicity characteristic of these huts appears also in the dwellings of nomadic shepherds, whether the structure is a cabin that can be dismantled, as among the Teda of the Tibesti region, or a tent of more or less considerable size like those of the Tuaregs of the Sahara. Interior divisions are made by mats and coverings, and the furnishings consist of a few pallets placed on the ground and some utility objects. However, neither hunters of small game nor wandering shepherds seem ever to have produced art of great quality, though for different reasons: cultural poverty in one case and economic distress in the other (see PALEO-AFRICAN CULTURES).

The interiors found in agricultural societies and among hunters of big game and fishermen are more complex. Some primitive agricultural tribes live in large multifamily houses, such as the *malocas*, of the forest dwellers of the Amazon River. In these, partitioning of the interior space is a social necessity, but the partitions used are for the most part functional and lack artistic character. Other agricultural tribes, among them almost all the Bantu of central and southern Africa, the Melanesians, and the Maori of New Zealand (PL. 91), have architecturally simpler dwellings, but at least in some cases (the semi-Bantu of the Cross River and the Zulu of southern Africa) these have interior partitions with a certain degree of artistic refinement. Among the Maori, interiors, especially those in the houses of nobles and chiefs, are painted red and ornamented with elegant decorative motifs, predominantly of the stylized human figure, which bear a certain affinity to the decorations of the Haida of British Columbia. In contrast, the more highly civilized agricultural tribes in the Mexican-Andean zone evinced practically no interest in interior design, despite the impressiveness of their dwellings (which were fixed and sometimes made of masonry) and the advanced state of their other arts.

In some primitive societies religious factors are decisive in determining the structure of interiors. For example, there is often a close correspondence between complex partitioning of interiors and an elaborate concept of the universe. Among almost all primitive peoples the real and symbolic center of the house is the hearth, which at times even takes on a sacred character; among the Aztecs, for instance, the hearth was the symbol of the fire god. Elsewhere the same role of domestic center is performed by the central post supporting the roof. Among the Somali of Merca this post has particular cosmological significance, for they place at the top of it a wooden disk (IV, PL. 86) incised with motifs that, according to Leo Frobenius, symbolize the universe (see COSMOLOGY AND CARTOGRAPHY).

A more complex symbolism, involving both the interior and the exterior of a building, is found among the Dogon of the western Sudan region. The "great house" of a Dogon family represents an image of the primordial ancestral pair or of a man lying on his right side in an ithyphallic position, while various parts of the building are likened to different parts of the human body. Similar ideas are found among the Mossi of the Sudan and seem also to have inspired the complex structures found in Upper Volta, known as "castles" or "fortresses," in which the layout of the interior spaces, the decoration of the walls, the placement of the ceiling and door beams, and even the locks, are all determined by anthropological and cosmological conceptions. Among the Bantu of Rhodesia, doors, utensils, and furniture — what little there is of it — are decorated with female sexual symbols. A different symbolism prevails among the Pueblos of Arizona, whose kivas, the large circular or rectangular chambers used for public and religious ceremonies, are determined in form, structure, and decoration by the Pueblo belief that the entrance into the spirit world is located in these chambers.

structure, architecture in a more advanced state of development presents for the first time the problem of a distinction between architecture and furnishings, the latter understood as elements or objects added to the space which architecture isolates from the surrounding world for the purpose of making it practical, functional, and habitable.

In the fixed house made of masonry, which appeared in the entire Mediterranean basin during the pre-Hellenic period, the basic units, whether circular or rectangular in plan (see STRUCTURAL TYPES AND METHODS), were usually grouped about an area that served as the court or the square. Just as the square was the center of urban life, so the court was the center of the house, and the rooms served no other purpose than to provide a place for nightly rest and for protection from inclement weather. A small porch, which usually effected a transition between courtyard and rooms, served to filter the heat and light, an important function in the hot countries of the Mediterranean.

Examples of the oldest structures with interior articulations that might be classified as furnishings in the modern sense are found at Hattushash, the capital of the Hittite empire. These houses included mats, trellises, and a few objects that can be considered furniture, but what is more significant is that mats, skins, and textiles were hung between the supports of the interior to modify the bareness of the cell, adapting it to the necessities of life.

Egyptian houses and palaces, such as the palace at Tell el 'Amarna and the tomb or "labyrinth" of Amenemhet III (Herodotus, ii, 148), had rooms, courts, and gardens laid out in an axial arrangement that in itself relegated furnishings to a place of secondary importance. Formal elaboration of interiors was, moreover, confined to an ever richer ornamentation of ceilings, walls, and floors. Although this sumptuous decoration served to adorn the structural elements, it did not articulate or determine them, nor were the few furnishings intended to create a unified atmosphere; they were simply included as incidental items of use. The Pharaoh's throne constituted the sole exception, for it was placed so as always to be seen from the front, and its superabundance of ornament and complexity of structure made the throne the focal point of the room that contained it.

Similar characteristics were found in the Cretan palace, although the law of frontality was undeniably violated at times, as in the so-called "Throne Room" at Knossos (PL. 92). On the other hand, the placement of the hearth in the Mycenaean palace, which was organized around the megaron with the hearth at its center, relegated the throne to a position of minor importance, for the throne was placed against one of the room's long walls. Only in a later age, in temples that repeated the typical form of the megaron, was there a return to perfect axiality through placement of the god's image against the back wall opposite the entrance. In the Mycenaean palace the decoration of floors and especially of walls achieved effects of great splendor; there was a separation of ornament from structure, as seen in the great friezes of shields painted or hung on walls or in the thrones placed, often together with benches and similar furnishings, along the sides of the room. Four columns surrounding the hearth marked off a sacred enclosure to emphasize its determining function within the room. Hangings seem again to have served both as partitions within the space and as elements accenting the most important area or furnishing of the room. It was in the latter character, imbued with religious significance, that hangings passed into the classical and post-classical interior.

Another element transmitted by these early structures was the courtyard, which became, in the form of atrium and peristyle, the central space or introductory element in the articulation of the interior. The use of the interior court and the disposition of rooms around this court, as found particularly in the Roman house, was of great importance in the matter of furnishings. Each room was a unit in itself, opening not upon other rooms but generally upon such central spaces as the atrium and peristyle, and thus the interior decoration of each room was designed to be viewed directly from the central space of the court.

Concerning furnishings in the stricter sense (see FURNITURE), since only rarely and in few sites have any pieces been found in place, recourse must be had to funerary monuments for documentation. Important for this purpose are the Etruscan Tomb of the Reliefs at Cerveteri (PL. 95) and the Roman sarcophagus from Simpelveld (J. H. Holwerda, "Romeinsche sarcophaag uit Simpelveld," *IAE*, XXXII, 1934, suppl., pp. 27–48). Since the function of the sarcophagus could have determined the arrangement of objects such as beds, chests, tables, and chairs along the sides to provide an empty central space for the body, the Cerveteri tomb affords a better indication of an original arrangement. The central space of the tomb is surrounded by cubicles with large *klinai* — beds — set in alcoves. Other pieces of furniture are distributed along the walls or set against the piers. Their placement undoubtedly mirrored faithfully the interior of a house, except that one important accessory is missing: the partitions and hangings that must have created smaller rooms within the spacious interior. Transennae are documented archaeologically at Herculaneum. These movable screens, apparently not provided for in the construction of the building, created secondary rooms within the principal ones and isolated both space and furnishings in single smaller units. The furniture was placed along the walls, especially alongside doors and passageways, both for decorative effect and for emphasis on perspectival recession. Only a few small tables, fixed or movable, seem usually to have been placed in the center of the room as a focal point for directing attention to the symmetrical disposition of the other furnishings and decorative elements such as statues, reliefs, and inlay. Large objects such as beds were often put in an alcove that concealed their bulk, while the floor of the alcove was treated differently to underline its independence of the room.

The relative unimportance of furniture was compensated by abundant decoration of ceilings (PL. 96), walls, and floors with carved or painted ornamentation, with pictures, mosaics, figured inlays, or simple ornamental motifs. Among the Romans, wall painting with views, scenes, landscapes, and architecture (PL. 93) developed in a manner unknown to the Greeks, who articulated the wall with an endless series of minor variations of simulated marble incrustation. The lack of interest in furniture also helps to explain the development of great mosaic floor decorations, with and without figure motifs. Only hangings and wooden or marble screens, not bulky furniture, were placed against walls, for objects that blended with the wall's pictorial content were favored.

A similar emphasis on wall decoration existed in the late-antique period and in the Byzantine world, when even the nymphaea were represented as part of the interior decoration of the house, for they were depicted on the walls. The walls were also decorated with rich inlay work that disguised their structure or were pierced by many-apertured windows that permitted the outside world to enter the interior.

All the elements of Byzantine decoration, featuring wall hangings, side furniture, central throne, and axial arrangement of rooms, were carried over into the interiors of Christian places of worship. Arranged along the same axis as the area assigned to the faithful were the altar or martyrium (in churches or cathedrals built on a central plan) and the cathedra, altar, and choir (in churches with an elongated nave). Curtains closed the sanctuary from view at established moments in the liturgy. Other furnishings, if any, were set along the walls. Mosaics, inlay, and painting covered floors and walls.

Michelangelo CAGIANO DE AZEVEDO

The preceding section includes contributions by Giancarlo Ambroseti

The West. The period of decline in Europe following the dissolution of the Roman Empire caused a standstill in building construction and consequent retrogression in the development of interior design. Evidence dating back to the 6th and 7th centuries, the period of greatest disturbance in Europe, is too scanty and intermittent to permit any true reconstruction of interiors. It is known, however, that the barbarians for the most part restricted themselves to the easily transportable tent and that the settled population, engaged mainly in farming and pastoral activity, lived in wooden houses that had, occasionally, a masonry foundation and that consisted of a single room, probably

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

equipped only with a hearth. The house, then, like the tent, had a merely protective function.

Written sources, a few ivories, rare miniatures, and especially the remains of princely residences, permit some more exact deductions as regards the 8th and 9th centuries, a period when the Carolingian empire established itself in central Europe, laid down the foundations of the Holy Roman Empire, and gave initial impetus to the feudal system. Documents that refer only to the dwellings of the nobility can be supplemented by what is known about monastic establishments. From the latter the general aspect of the interiors of private homes can be deduced, since most of the monastery buildings were designated for housing, as can be seen, for example, in the 9th-century plan for the monastery of Saint-Gallen (see H. Reinhardt, *Der St. Galler Klosterplan*, Saint-Gallen, 1952). In contrast to the world of the monastery, life in the house of the feudal lord apparently took place primarily in one room — the main hall (corresponding roughly in function to the monastery's chapter room) which, according to the sources, had a simple rectangular plan and served not only for the reception of officials and for banquets, but also as a bedchamber of the lord. As seen in miniatures, heavy curtains closed off the bed on all four sides. In all probability a throne (III, PLS. 64, 68), or at least a chair of office, constituted the most notable piece of furniture. Cushions and precious silks decorated this seat and precious hangings probably covered the walls, which were otherwise cold and bare. Apparently there was a fondness for painted walls, as is indicated by the frescoes (now lost) of Charlemagne's palace at Aachen with scenes of war, by the murals representing the liberal arts and the seasons in the residence of Theodulf, bishop of Orléans, and by those of the imperial residence at Ingelheim, depicting figures, painted by order of Louis the Pious.

Splendor and color, evident even in church interiors, seem to have formed the dominant note in these rooms, but as a result the autonomous architectonic quality of the interior was weakened. That quality was better respected in monasteries, because of the asceticism inherent in monastic life. In these establishments different rooms were assigned for different aspects of daily life; besides the chapter room, there were also a refectory, one or more dormitories, and cells. Sobriety characterized the furnishings. Carolingian and Ottonian miniatures representing Evangelists in their studies (X, PL. 471) probably faithfully portray the interior of the cells (see FURNITURE).

The Byzantine world of the Middle Ages displayed particular lavishness in interior decoration. The 10th-century book of Constantine VII Porphyrogenitus, *De ceremoniis*, gives much information concerning the axial disposition of rooms, the placement of furniture, and the importance of the throne as a central focus, emphasized by the presence of hangings. The house of the Byzantine nobleman was apparently divided into numerous rooms, with a large reception room on the first or second floor, a porticoed façade, interior gardens, and baths. The proximity of the Orient undoubtedly influenced the formation of a taste for sumptuous interiors, a taste indulged also in religious edifices, where the predominance of decorative elements — first mosaics and later frescoes — indicates a tendency which ultimately led to the dissolution of the architectonic structure into light and color (I, PL. 411). Considering this development, it can be justly supposed that in the houses of the nobility mosaics were replaced by rich silks and damasks. The silken hanging that closes a doorway in the mosaic in S. Vitale showing Theodora and her court (Ravenna, 6th cent.; II, PL. 446) is an example of this taste, which reappears in the 11th-century mosaics at Daphne and in mosaics of the Palaeologian renaissance [the Kariye Camii (Kahrié Jami) at Constantinople; see BYZANTINE ART].

In Europe the political events that took place about the year 1000 — the consolidation of the feudal classes and the formation of the various nations — signaled a period of lively elaboration and rebirth in architecture, culminating during the 11th century in the Romanesque. The private dwelling began to gain greater importance in this period. Having developed initially from the fortified residence of the feudal lord, to which eventually was added a true domestic area, the private dwelling evolved within the next century into the town house and, in Italy, into the city hall, which may be considered a fundamental element in reconstructing the taste of this epoch.

It was in the Romanesque period that the various orientations peculiar to different countries manifested themselves. With the adaptation of the dwelling to its surroundings, various local tendencies developed, and there evolved a difference in taste in interior design between countries of the north and countries of the south. Rooms in northern countries were as a rule not so large, had smaller windows, were more closely grouped and more sheltered, and the use of wood facing for interiors became customary, especially in England. Rooms in Mediterranean countries, particularly in Italy, had more light and were more spacious and of a more fixed architectural plan.

Also in the Romanesque period there emerged, in private houses, a distinction in rooms according to their use, so that the main hall, though still the nucleus of the house, served simply as a place of reception, and the bedchamber was either moved into an alcove facing this hall or was completely separated from it. The first rudimentary furnishings of this period were developed for this room. They consisted of the bed with its curtains or canopy, a chest (later transformed into an actual platform at the foot of the bed; PL. 98; IV, PL. 104; VI, PL. 380) used for storage of clothing, and a little table built into the wall to support a light or small objects. With increasing frequency a fireplace was to be seen in the main hall (PL. 94); however, it had lost its symbolic and sentimental significance and functioned only as the center for the diffusion of heat. Miniatures show that various forms which differed from the traditional semicircular hood were tried out for the fireplace. The placement of fixed pieces of furniture began to be made with consideration of the interior atmosphere, and furniture assumed decorative as well as functional value. Ornate chairs, like those in chapter rooms or in church choirs, were placed along walls. The table, also ornate, was normally coupled with a high-backed bench (cf. copies from the *Hortus deliciarum* of Herrad von Landsberg, destroyed in 1870), and was reserved for the master of the house. When necessary, tables on stands were set up for guests. Seats were cut into window embrasures, and walls were seldom without some niche for the placement of objects. A light hanging from the center of the ceiling served for illumination (*Codex Aureus Epternacensis*, fol. 36, from Echternach, Nürnberg, Germanisches National Mus., ca. 1035–40). Of special importance to interior design is the introduction of tapestries, which not only decorated walls but actually served as walls, dividing large rooms into smaller areas. Walls were now frescoed with decorative motifs similar to those on textiles, and ceilings with exposed beams had colored ornamentation and moldings (cf. the ceiling painted with animals and narrative scenes, 13th cent.; Metz, Mus. Central). The kitchen, which the monks had always built as a separate room, was now set apart in secular dwellings as well. The hearth was open, and the absence of cabinets suggests that the various utensils were hung on the walls. There were bathrooms in the more imposing establishments. In the Castel del Monte near Andria the bedrooms, situated on the second floor, were furnished with a bath and an anteroom to it cleverly cut out of the corner towers.

The trend toward functional distribution of rooms was further developed in the Gothic period, during which furnishings increased in refinement. Visual evidence from this period is much more abundant and is supplemented by literary references. Based upon a subtle feeling for the verticality produced by the ogival vault, the structure of a Gothic interior encouraged, especially in the north, a greater decorative richness in furniture, which absorbed in its ornamentation and articulation suggestions from architecture. In England decoration in wood gained in favor; ceiling decoration became ever more refined, and furnishings in private houses, though not so sumptuous as those in Gothic churches, were often richly and imaginatively ornamented (PL. 99). For the first time, sideboards, derived from chests, appeared in the rooms; cupboards were frequently used, and the *prie-dieu* for private devotions was frequently placed in bedchambers, often in front of a small portable altar, a crucifix, or a statuette of the Virgin. The proper furniture for each

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

type of room was specified with progressively greater exactitude, and there developed at the same time a propensity for items of great value (once reserved exclusively for the Church) and of rarity, such as banquet tableware and Oriental silks, objects that added a note of refinement to the rooms. This tendency reached its peak in the late Gothic period, when the richness of setting was matched by that of costume. During this period, also, shops were equipped with shelves and counters, as can be seen from many miniatures (PL. 98) and from the fresco of Good Government by Ambrogio Lorenzetti in the Palazzo Pubblico, Siena.

Fernanda DE' MAFFEI

The taste for precious objects and fine furnishings that dominated northern Europe during the late Gothic period manifested itself also in Italy in the period immediately preceding the Renaissance. There is exact and ample information about the dwellings of the Florentine nobility and bourgeoisie of that period (PL. 100). All the walls of the house, even those of the bathrooms, were decorated, some with geometric motifs executed in freehand, others with isolated figures or picture cycles. Windows seldom had glass panes; more often they were curtained or screened with some transparent material. Brick flooring was replaced by painted or glazed tiling (VI, PL. 179). Wood ceilings retained their natural color, though colored ornamental motifs often stood out against the plain ground. Unity of interior design was created by the wood facing of the walls that reached a height of more than 20 in. above the floor. Acting as a backing for various pieces of furniture such as chests, beds, and benches, this facing was gradually enriched with complex moldings, inlay work, and pictures. Good examples are the *studiolo* of the Palazzo Ducale in Urbino (PL. 100) and the fresco *The Birth of the Virgin* by Ghirlandajo in S. Maria Novella in Florence (VI, PL. 184). In the Medici-Riccardi Palace on Via Larga (now Via Cavour), in Florence, the antechamber of Lorenzo the Magnificent had "a wainscoting of pine all around, XX *braccia* in width, IV *braccia* high, with cornices and bosses of walnut and inlay work and with a similarly inlaid chest at the entrance to the antechamber.... One part of this wainscoting functions as part of a day bed, another as part of a cupboard with two locks, and in addition there are set into the wainscoting the side pieces and the bolster of a bedstead."

Tapestries were placed on tables, chests, and the floor as well as on walls, and were often used along with wooden facing and painted wall decorations. As a novelty, in use not only at the Medici court but even in the houses of private families, works of art were employed as furnishings and arranged according to affinities of style, without regard for subject matter. Sacred scenes and allegories of a secular nature were grouped with ancient bas-reliefs and contemporary statues.

In the north, especially during the late Gothic period, there also prevailed a taste for precious objects and fine furnishings (PL. 99). However, there was often a stylistic difference between the furnished interiors and the architecture that enclosed them. In the south the plan of the buildings generally remained rigidly geometrical, and the external appearance of the structure was one of compactness, with windows set symmetrically, so that all the rooms had to have the same plan. In the north the interior literally broke through the architectural envelope in covered porches, turrets, and other projections. At times the asymmetrically placed windows almost completely replaced the solid exterior wall, and the exterior conformed in shape to the interior, while the walls between rooms became light trellises placed at will.

In northern Europe, in short, the distinction between interior and exterior formulated by the builders of late antiquity broke down because a relationship was established between closed interior spaces and those exterior ones formed by the city itself, both receiving an architectural treatment identical in tendency. Visual confirmation of this tendency can be found in still-preserved medieval towns and quarters, with their inextricable weaving of interior and exterior spaces into one single compact pattern, where streets, squares, courtyards, porticoes, entrance ways, and interiors all flow one into the other.

While construction in the north was moving toward this state of continuity, more regular systems of town planning were attempted in Italy, at the threshold of the modern era. Perspective, as conceived by Italian artists of the 15th century, introduced a procedural method in architectural planning that helped to disintegrate the earlier medieval concept of continuity. Though expressed in new terms, there reappeared with the Renaissance *palazzo* the classical dualism of interior as opposed to exterior, and on the basis of that dualism the relationship between the architect and the other planners involved in the realization of a buildings was defined. The architect created the parietal box of the building and some of the finishing touches that form the so-called "architectural decoration," that is, the architectural orders, the door and window frames, the balustrades, and the like. The rest — statues, pictures, and furnishings — could be handled by other specialists, and a certain degree of independence of the architectural framework could be taken for granted (this is in part expressed even in the Italian term *mobili*, literally "movables," that generally refers to household furnishings). Thus it was possible to separate systematically the interior decoration from the architecture, especially in those rooms not directly involved in the general composition of the building.

Strictly speaking, the architectural definition of interiors and façades may be understood as the application of certain finishing touches to a preexisting structure. Between the interior and the exterior detailing there is a neutral architectural support that makes it possible to conceive of the two resulting compositions as independent entities. One of the most important works of the early Renaissance, Leon Battista Alberti's Tempio Malatestiano (I, PL. 52) at Rimini, is in fact constructed about an older core covered outside and in by a new architectural envelope.

Whenever an interior space is considered as an independent unit, perspective furnishes a means of creating around it the illusion of more space by pictorially prolonging on the walls continued recession into depth. Perspective views either painted or outlined in low relief are frequently found on the walls of this period, from Milan — S. Maria presso S. Satiro by Bramante (II, PL. 340) — to Rome (the Farnesina by Baldassarre Peruzzi). These views produce the desired effect only when seen from a point along the axis of the room. Even ceiling decorations, like those of Mantegna in the Palazzo Ducale in Mantua (IX, PL. 329) are frequently subject to a vertical perspective view.

In the courtly, rational atmosphere of the Renaissance places of withdrawal were often created in isolated parts of the interior, either by means of partitions or through artificial constructions of wood. The *studiolo* of Federigo da Montefeltro in the Palazzo Ducale in Urbino (PLS. 80, 100), for example, is a complete room within a room, an autonomous, independently planned edifice that served to create, within a larger space, an area of different dimensions, for practical and perhaps for psychological reasons. For similar reasons dormitories in 15th-century monasteries were divided into cells that were occasionally narrow and dark, and were in contrast to the even luminosity of the otherwise undifferentiated, geometric interior. This is well illustrated in the famous panel by Antonello da Messina, representing St. Jerome in his study (I, PL. 311), where, in a manner that is not entirely a product of the imagination, the study is formed by a half-enclosed wooden structure placed in the midst of the great spatial void created by the architecture.

Rooms designed for intimacy (as even their names — studies, *camerini*, writing rooms — indicate) and furnished appropriately became ever more frequent in Renaissance *palazzi*. Their notable characteristics were indirect lighting, avoidance of general illumination, and deliberate proportional reduction of scale. Studies sometimes served as true private apartments, completely isolated from the rest of the palace, and were occasionally tiny, like the *grotta* of Isabella d'Este in the Castello di S. Giorgio in the Palazzo Ducale in Mantua or the *camerini* of Alfonso d'Este at Ferrara. Their ceilings were painted or gilded, their floors richly colorful, yet their relation to nature is in some cases rather more direct than in normal, full-scale buildings. In the south these exceptional rooms are the only ones, except

UP State Museum, Lucknow

perhaps in the wooden houses of the common people, which can be said to have a unified interior decoration.

The imaginative palace decoration introduced by the Italian mannerists, which covered every wall with a sort of fresco tapestry, sought to reduce the restrictive effect of enclosing walls to an even greater degree than was possible with illusionistic perspective. The best results were obtained in city and country villas, especially with loggias that opened onto gardens, where such decorations as festoons of flowers and mythological scenes alluding to the seasons or to the hours of the day cleverly succeeded in creating a sense of unity with nature (PL. 101).

In the mannerist country villas of Italy, as in the renovated feudal castles of France — exposed to the weather, complex in structure, and serving diverse economic and social purposes — concern for façade was increasingly accompanied by attention to problems of adaptability and comfort. The best possible exposure was the subject of endless discussions by doctors and technicians. Widespread and rapid improvement of fireplaces made it possible to inhabit more rooms during the winter. The distribution of rooms became ever more varied, not only according to function but also according to exposure and to the extent of their use in winter or summer. Ceilings both of wood and of masonry were used, and even with the prevalence of the vault, quite noteworthy elaborations of plan were obtained.

Differences between north and south in the conception of interior space persisted in the baroque period. In northern Europe the development of interiors was characterized by opposition to the pomp represented by architectural symmetry. The transition to the ever more intimate and lively interiors of the rococo occurred almost spontaneously in a progressive breakdown of large salons into smaller rooms, with greater use of wood, stucco decoration, and, later, elegant textiles. Madame de Rambouillet — who at the end of the 16th century anticipated the rococo style with her enameled sideboards, loaded with Chinese porcelains, crystal vases, ebony framed mirrors, and small gilt caskets — is credited more than anyone else with having made a sharp distinction between official, residential, and service quarters. In about 1640 the plan of the usual *hôtel* included a vestibule, an anteroom used for dining, a reception room, a drawing room, an alcove, and several clothes closets. In time, drawing rooms, alcoves, and closets increased in number to the point that each inhabitant of the house had his private bedroom (except the servants, who were either housed in dormitories or in attics beneath the mansard roofs). Partitions, lofts, corridors, and service stairs helped realize this arrangement.

The baroque architects of Italy took little interest in changing the disposition of interiors in private buildings and limited themselves to designing rooms of rectangular plan, with vaults of uniform height. Though they frequently violated such Renaissance principles as the relative independence of basic structure and final detail or the geometric organization of interrelated elements, the deliberate aim of baroque architects was to keep interior space strictly architectonic. In exceptional instances, however, a preference for interiors of great complexity led to a dynamic fusion of the various spaces into one formal continuum that is esthetically resolved only when the entire interior space is viewed as a whole. In many baroque interiors the architectural details, the pictures, the sculpture, and the furnishings form a unified complex, in which the control of color was so great that often, or regularly in the case of Borromini's interiors, such artificial materials as plaster, stucco, and varnish were preferred to natural materials. But in general the practice of considering interior and exterior separately was not discontinued. Indeed, the distinction between the two aspects was reinforced because of the taut declarative character which each assumed. Such a contrast of interior and exterior may be found in the principal works of Borromini (q.v.) in Rome: S. Carlino alle Quattro Fontane, S. Ivo alla Sapienza, S. Andrea delle Fratte.

Baroque freedom of plan extended but slowly into the realm of the private dwelling. However, once firmly established at the beginning of the 18th century, it occasioned a rather drastic architectural change. The greatest variety in plan was now to be observed in the interior, not the exterior. This freedom was the result of the subordination of architecture to an increasingly artificial mode of decoration that was actually separated from its architectonic enclosure by hollow walls and false ceilings. Whereas the architecture, in its particular style, was accepted as something external and public, an owner considered it almost a social duty to shape the interior to his own liking, being aided in the endeavor by many practical guides and designs. There is often an odd contrast between the restrained exterior and the rich interior, as combined, for example, in the Petit Trianon at Versailles (V, PL. 421). The reign of Louis XV was particularly characterized by a desire for intimacy and comfort. The heating of rooms became a great preoccupation: hermetically sealed windows were tried; bathrooms became more numerous. This was the heyday of private studies (the study being considered even in treatises the most important room in a suite), of small rooms with secret passages for servants, and of the service corridor. The furniture was often made by the same craftsmen who made the room decorations and was frequently patterned on designs by the building's architect. The rococo period, which reached its artistic peak precisely in the field of interior decoration, also marked a high point in the very close collaboration of artists and craftsmen, a fusion of the work of architect, decorator, sculptor, wood carver, stuccoworker, and tapestry weaver (PLS. 108, 117; V, PL. 416). This type of art spread throughout Europe, although its center of diffusion, despite the multiplicity of stylistic developments, was always Paris. An extremely rich mode of decoration, it nevertheless fulfilled new economic requirements, since it utilized cheap materials easily worked by craftsmen of moderate skill. It required, moreover, a wall enclosure of the simplest kind.

The neoclassic reaction that took place about the middle of the 18th century against this aspect of the rococo was above all stylistic in character (PLS. 110, 111, 118). It developed throughout Europe almost simultaneously and produced a return to greater dignity in interiors: proportions were enlarged and unified and plans simplified even to the extent of a loss of intimacy in private life, often for the sole purpose of creating perspective views through doors and mirrors, repeated ad infinitum. Furniture regained autonomy; its forms became more rigid and geometric, so that it was seen in greater isolation and once again assumed an architectonic dignity. In contrast, an effort had been made during the rococo period to fuse furniture with general decoration as much as possible, fitting it into corners, merging it with curtains and other objects, and modeling it in organic forms. The artisan of the neoclassic period therefore sought and often effected a balance of style between interior and exterior. The penchant for an archaeological correctness in furniture prevailed in all of Europe except England, where, independently of this fashion, Chippendale, the Adam (q.v.) brothers, George Hepplewhite, and Thomas Sheraton enjoyed the greatest renown as interior decorators, following a declared policy of uniting "the useful to the pleasing." (See V, PLS. 448–450; VI, PL. 442; X, PLS. 270, 271.)

There were also attempts at proportioning according to human scale that today seem extraordinarily advanced, calling to mind comparable discussions of Le Corbusier. Ventura Rodríguez's Casita de Abajo, built in 1773 at the Escorial by Charles III of Spain for his son Prince Carlos, is proportioned like a doll's house, adapted for use by a child, with furniture fitted harmoniously into the general ensemble, everything equally small in scale. Indeed, the principles laid down by Percier and Fontaine (1801–27) may here also be considered valid. "Furnishings are overly bound to the decoration of interiors in order that the architect may be indifferent to them. When, in spirit, decoration is separated from construction and does not operate in accord with it, decoration soon abandons itself to every form of absurdity and contradiction. Not only will it pervert the essential forms of the building; it will cause them to vanish. Mirrors placed without judgment and tapestries placed at random will open up voids where there should be solids, solids where there should be voids. Structure should

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

be to buildings what the skeleton is to the human body. It should be beautified without being masked completely. And it is the structure, varying according to country, clime, and type of building, that determines the character of the decoration. But whatever the size and importance of the building, the finished work will lack spiritual meaning if the decoration is not planned along with the construction, if the basic form of the building does not seem in accord with details, if, finally, one perceives that the building is the product of two wills in discord."

Shortly after these ideas were expressed, furnishings returned to a course of completely independent development, thereby avoiding, primarily for practical reasons, the problem of total accord.

In the 19th century, the romantic architect could refer to a variety of styles of the past, selecting or rejecting at will, a possibility widely exploited in the treatment of interiors as differentiated from that of exteriors. This era gave birth to the notion of "period furnishings," the adoption of which in the world of fashion remained independent of architecture proper. There also originated the idea of the "period room," which allowed the existence, side by side, of rooms furnished in contrasting styles (PL. 112).

It should also be noted that the production of furniture and furnishings on an industrial scale rendered it more difficult for the person of ordinary means to adapt furnishings to a given architectural setting, since the pieces were usually purchased ready-made from the store (see INDUSTRIAL DESIGN). Furthermore, temporary arrangements in rented apartments generally caused furnishings to become more ephemeral than buildings and to be subjected to many more transformations.

These circumstances helped confirm the academic distinctions between "building," "rooms," and "furniture" that theorists felt obliged to set up with almost scientific precision during this period. The paradoxical intermixture of stylistically diverse furnishings and bric-a-brac made evident the conventional character of this reference to past styles. The contradictions arising from the complex of conventions existing especially after the middle of the 19th century constituted, by the 20th century, a most important impetus in the campaign for the renewal of architecture and interior design.

Eugenio BATTISTI and Leonardo BENEVOLO

The East. a. The Iranian, Indian, and Islamic world. Interior decoration in India and the Islamic world has been largely determined by the fact that climate and socio-economic conditions have always favored outdoor life and a minimum of easily movable furniture. Rulers and nobles spent much of their life in military campaigns, hunting expeditions, and sports such as polo. Merchants spent years on caravan journeys. Pilgrims, ascetics, and dervishes were always on the move. Ladies preferred to stay in enclosed gardens. The tent, the open enclosure, and the open hall, therefore, were more important than the closed room, which served as refuge only during the hottest summer hours or during the winter. Furniture was continually moved in and out and could not be heavy. Even in mountain countries such as Nepal, Kashmir, Afghanistan, Iran, and Asia Minor, where the climate enforced a longer stay in closed rooms, this style of life was not basically altered. Furniture consisted mainly of chests, bedsteads (used also among other things as benches and seats of honor), low tables or footstools, folding reading-desks, carpets, and cushions.

The character and arrangement of rooms determined their shape and decoration. Normally, the house was planned around one or several inner courts (in Kerala and Malabar practically an atrium) onto which the rooms opened either directly or indirectly, across a surrounding terrace or gallery. Where this inner court was absent, there was at least one open gallery (*maq'ad*, *dālān*) overlooking the street or an open courtyard and sometimes projecting into one or several open or screened verandas. Because of the small amount of furniture, a distinction was seldom made between individual bedrooms (when belonging to a prince called *khwābgāh*), dining rooms, and drawing rooms, but merely between common and reception rooms, and between private rooms and shops. For safety, staircases were generally very narrow, even in palaces. Doors were closed by curtains, except the entrance door which had a strong gate and a bench (mastaba) or niche for the guardian of the door (*bawwāb*, *dvārapāla*), and the access to the family (i.e., the ladies') court, which had a passage or corridor planned in such a manner that it was impossible to see the interior even when the door was wide open. Most of the rooms received their light through the door or a small window above it, or through a big window or balcony in the exterior wall, the opening being filled, however, with bricks set in openwork or with perforated stone slabs, or a wooden lattice. The walls were plain, except for numerous niches. The common rooms were generally on the top floor, which was reserved for the family, and the richly decorated reception rooms generally were on the first floor (*mandara*, *dīwānkhāna*, *bīrūn*, *khās*, *mahal*, *salāmlik*) if the house had several stories; otherwise they were in the back and central courts.

The common room (*ūrsī*, *balakhāna*) was merely a large room with elaborately decorated walls, accessible from a pillared porch, colonnade, or gallery. It usually served as a drawing room for the owner of the house and his intimate friends or for the harem (zenana), or alternately for both. It was therefore either richly painted (*rang mahal*) or covered with mirror mosaic, and small rooms used for sleeping often adjoined it. At times a square hall covered by a cupola was used, in Spain and in the Maghrib as *mashwar*, or council hall (such as the Sala de los Ambajadores in the Alhambra), in India for the common rooms of several Rajput palaces (Chitorgarh and Hindoli, for example). From the 18th century on, in Turkey, Iran, and Afghanistan, this room was usually closed on one, two, or three sides by glass windows set in a wooden framework.

There were three basic types of large reception room. The Indian type was a one- or two-storied hall (*śālā*) constructed in wood or stone and surrounded by a gallery. The Irano-Islamic type was a high-vaulted hall (liwan, *īvān*) opening on one side onto a garden or court, and often expanded into a combination of similar liwans opening onto a central court or dome. The Syro-Lebanese type was a flat-roofed hall running across the length of the building, lighted by windows or balconies at both ends. The garden pavilion was either an ordinary chamber open on one side, a variation of the Indian garden house, or a combination of several liwans set either back to back or around a central hall and opening onto the garden (*kōshk*, kiosk). The corners which had to bear the thrust of the liwan vaults served as storage nooks or small dressing rooms. These liwan combinations were also used for mausoleums, madrasahs, small mosques and even Hindu temples. There were in addition hypostyle halls of several stories combined with open terraces (*hawā mahal*) as well as underground retreats for the summer, often connected with a well (*takhtabosh*, *tākhāna*, serdab).

The Indian reception room consisted of an oblong (occasionally square, very rarely circular) hall surrounded by two rows of columns between which ran a narrow gallery. In most cases this gallery was lower than the central hall or stood on a platform interrupted at the principal entrances. In some cases it supported an upper gallery that was either open at both ends or closed by a grille. This main hall could serve many purposes: here were held audiences, dance performances, banquets, even religious ceremonies (in which case a chapel or even a full-size temple joined it at one end). In the lower gallery servants and spectators gathered, while from the upper gallery ladies, children, guests, and musicians could observe the ceremonies below without being seen. Halls of this kind go back to early Buddhist wooden architecture (see BUDDHIST PRIMITIVE SCHOOLS). The vimanas of South Indian temples (see DRAVIDIAN ART) and the rectangular mandapas of Marāthā wood temples (see DECCAN ART) are similar in type. From the latter there developed the *baradari*, a garden house or temple, consisting of a high central hall and a surrounding gallery of four oblong and four square rooms. In the course of that development the construction of these rooms changed time and again. First provided with wooden barrel vaults, they later

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

were given trabeated ceilings that rested on supporting stone beams or corbel brackets. From the 15th century on, they were covered with vaults of stone or brick and domes resting on arches. The columns in these rooms were heavily carved with figures, and the platform plinths, the parapets of the balconies, the entablatures, and the grilles of the upper gallery were also decorated.

The Irano-Islamic type of reception room developed from Assyro-Babylonian brick architecture (see MESOPOTAMIA). Its first representatives were the Arabo-Parthian audience halls at Hatra. Commonly used in Sassanian palaces, the liwan was employed in Islamic architecture in many variations and combinations. At Ukhaidir the Sassanian scheme was repeated, though after a much more elaborate plan. At Samarra, however, the liwans were connected by two halls that intersected beneath a central dome. Subsequently two open liwans, one at each end, or four liwans, one on each of four sides, of a court became the rule, and these combinations were used also in madrasahs and mosques. In Mameluke Syria and Egypt the most common reception room, located on the upper floor, was the *qā'a* (IX, PL. 272), a domed central hall (*dūrqa'a*) generally with a fountain in the center, faced on two sides by two slightly raised liwans (*riwāqs*) and on the two remaining sides by the entrance and a trellised bay window overlooking street, court, or garden. Later, the open liwans were placed behind a colonnade. In the course of this development the liwan lost its original character; the vault was replaced by a flat wooden ceiling and only an ogival front arch survived. Examples of this modified liwan are to be found in several durbar halls in India, at Mandu for example, or Warangal.

The reception room of Syro-Lebanese type goes back to the ancient Near Eastern *bît-hilani* house. Very common in Lebanon, but less common in Syria and Palestine, it has inspired the plan of most Venetian palaces.

Fireplaces were used only in palaces situated in cold countries, such as Turkey, Iran, Afghanistan, the Punjab, and the Punjab Himalaya, and were regarded as an exceptional luxury. They were rather low, had a conical flue and a chimney inside the wall. The normal source of heat was (and still is) a brazier (*kāngrī*), often placed beneath a table covered with a thick cloth under which people slipped their bodies up to the waist in order to keep warm. To offset the summer heat, fountains were used; these had many thin jets falling into one or several basins. In Iran and India a channel of water ran through the reception and common rooms, starting from an artificial waterfall with fish-scale ducts and interrupted by low basins and fountains. When water was scarce, the channel wound its way through a series of labyrinths. Garden houses were constructed atop water courses or in the center of a pool filled with fountains and waterfalls. In Hindu palaces fountains were sometimes also arranged in a canal inside the gallery that circled the big reception hall.

In Turkish council halls and common rooms, in the Egypto-Syrian *qā'a*, and in the Maghribi *mashwar*, a low stone bench ran along the liwan walls or beneath the windows. It was backed by a smooth stone dado, and both back and seat were covered with cushions. Such benches had been used previously in ancient Sumerian and Babylonian temples and palaces. In Iran and India, where the nobles either stood or sat on the floor, only a throne appeared in the room. It was not so much a seat as a platform, one that could be occupied by several persons or used for sleeping (V, PL. 458). In India no distinction was made between a seat of honor and a bed, stone platforms (*chabutrās*) under trees being used as resting places for travelers, as a village meeting place, as sleeping accommodations, and even as temples. And correspondingly, the throne itself (*masnad*, *takht*) was regarded as a sort of sanctuary and was venerated by the Hindus. From the late 16th century on, ceremonial chairs came into fashion for imperial princes and princesses, queens, begums, and other persons of rank.

In Egypt and Syria bay windows closed by a wooden latticework screen (*mashrabiya*) formed part of the *qā'a*. In Turkey these were developed into screened or glassed-in verandas or balconies. In India balconies and bay windows often linked both the private and the common rooms to the exterior world, forming a raised gallery or small room that on one side opened (often like a balcony) onto the hall and on the other side projected as a balcony over a court or garden. This was the place of honor in the common room reserved for the owner of the house or his first lady or ladies, and it could be used in the most manifold ways: to enjoy the view outside, to receive guests and petitioners, or to listen to musicians, buffoons, and dancers inside. For the sake of privacy the bay window had a screen (*mashrabiya*, *jālī*) with small windows. In many Indian miniatures rulers, nobles, and their wives are depicted in these *jharokhā*s or bay windows. In the most elaborate examples, these windows were flanked by two rooms for the family and courtiers, opening at the front onto a court for visitors and entertainers, and at the back onto a room for servants bringing refreshments, the water pipe (narghile), the betel box, and so forth.

In the absence of cupboards wall niches played a most important role. Only objects that were not often used were stored away in chests. All other articles were left on the carpet-covered floor or placed in the wall niches. Ladies kept their jewels in "safes" — deep holes carved into the stone block at the bottom of a niche and accessible only through a narrow hole closed with a stone slab. In Indian palaces pavilions with "safes" like these are called *naulākhī* (literally 900,000, meaning a million). In the less important rooms all movable objects, such as crockery, toilet articles, books, textiles, and even oil lamps, were and still are put away in such niches. In ordinary Hindu houses little brass idols, or pictures of gods and saints, were set up in niches, and a burning oil lamp was placed before them. Wall niches were part of the decoration of reception rooms and were used to hold costly vases (especially those of Chinese porcelain), glassware, and metal vessels, or were themselves decorated with built-in mirrors, or with murals, or occasionally with mosaics, depicting religious or erotic subjects. Common to the ancient East, such niches are found in India depicted in the Ajanta frescoes. In Islamic art they were found in the caliphs' palaces at Samarra and appeared thereafter in an amazing variety of arrangements, sizes, and shapes (square and oblong, ending in round, ogival, keel, or cusped arches, trefoils, quatrefoils, etc.). The larger niches served for books and clothing or contained murals, and in libraries such niches — with stone shelves, separated by pilasters — covered the entire length of the walls. A special type are the *noguldūn* niches, which are set behind wooden or stucco boards cut out in the shape of the vases and flasks displayed therein. An inexpensive substitute for this special type were niches in which vases and bowls (with or without flower arrangements) were painted. From about the 17th century on, some of these wall niches were provided with doors, especially if the niche served as a bookcase or as a domestic chapel, eventually developing into the type of wall cupboard generally in use today.

Windows were normally closed by a latticework of stone (marble, sandstone, or alabaster), bricks, stucco, or wood, permitting the free circulation of air but admitting only a subdued light and no view of the outside. This latticework was made in the form of innumerable rows of lathe-turned rods, of simple grilles, or of bricks set chessboard fashion or crosswise, but the designs in most cases were complicated geometric patterns, stylized floral motifs, and in Hindu art also heraldic beasts and human figures. From early Islamic times on, this latticework was filled in by clear and colored glass panes. Because of their costliness, however, their use was limited to sanctuaries and royal palaces from the 11th to the 15th century, and became common only with the 18th century. In their stead the latticework was filled with thin, translucent slabs of marble, alabaster, or semiprecious stones. Where the climate was cold, the ordinary citizen fixed parchment or paper sheets behind the grille. Windows were constructed on two levels, the upper ones beneath the cornice, the lower ones at the level of the floor, the benches, or the bay windows.

Doors had two slender panels constructed of intersecting vertical and horizontal slats, with the interstices either boxed decoratively after the manner of a coffered ceiling (India) or

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

entirely faced with various woods, ivory, cast brass, or iron, arranged in complicated geometric patterns. Designs cut out in metal (of heraldic animals especially), embossed copper, or silver or gold sheets served as appliqués on this covering. Beginning with the 17th century, doors were also painted with flowers, landscapes, and human figures, and then lacquered. The top of the door frame was often adorned with a repetition of the cornice that decorated the room. Window shutters (used mainly in Iran and Turkey) were treated in a similar manner.

The common and reception rooms had to be richly decorated. In Hindu palaces statues were placed in front of the columns in these rooms, and the columns, brackets, and entablatures were covered with reliefs and statuary, especially of dancers, musicians, and erotic scenes, but also of the tutelary deities of the owners. The walls were covered with murals depicting mainly mythological and epic subjects, as well as all the conventional erotic subjects from lyric poetry. Literary sources often mention *citraśālā*s in the palaces of kings and nobles and in the houses of famous courtesans, which may well refer to decorations similar to the many genre scenes in the Ajanta caves (see AJANTA). However, all the examples that have survived date from recent centuries. Generally the walls were divided into horizontal friezes, the individual scenes being the size of ordinary miniatures, although sometimes they were as much as eight times as large. Very often the murals formed only a frieze immediately below the ceiling or the ceiling itself, in which case the murals were merely semifigural, ornamental patterns. In Islamic palaces figural paintings or reliefs were restricted to the harem and baths. It is mainly the palaces of the Ommiads, Abbassides, Fatimids, and Ghaznevids that furnish examples of figural scenes (see OMMIAD SCHOOLS, ABBASSIDE ART, FATIMID ART, GHAZNEVID ART). Under the Seljuks (see SELJUK ART), Ortuqids, Zangids, and Ayyubids, the cornice generally had figure carvings. Battle scenes, hunts, games, the pleasures of the table and of the garden, and erotic scenes formed the subject matter. In contrast, public rooms were decorated with floral, and geometric motifs and calligraphic benedictions (PL. 113). Originally, the medium used was Syro-Roman or Byzantine mosaic (*fusāīfisā*), then carved and painted stucco or wood. The typical Islamic style developed first under the Abbassides. Later, stylized flowers and flower arrangements executed in encaustic tiles, marble relief, or painting came into fashion. They were composed either like a tapestry or carpet, and were thus suggestive of the atmosphere of a tent, or were like a system of blind arches, the panels and cartouches filled with flowers, calligraphic inscriptions, and so forth, in alternation. Cornices and ceilings were no less richly decorated, often in *muqarna* (stalactite) work. At times, the whole domed ceiling dissolved into a complicated maze of *muqarna* motifs. These rich Islamic ceilings were taken over into the Mudejar style of Spain (see MOORISH STYLE), and comparable ceilings can be found even in Mexico and Peru.

A special type of decorated room is the *shīsh mahal* or *ainakhānā*, the walls of which are covered with mirror mosaic (*ainakarī*) in many patterns. Sometimes tiny mirrors were set into large panels of marble stucco or plaster, at other times the panels formed merely thin bands between the mirror pieces. The effect is very beautiful, especially when seen in candlelight or when it occurs in circular rooms and on domed ceilings. Beginning with the 18th century, mirrors — initially of looking-glass size but ultimately much larger — were mounted on walls and ceilings, especially in sleeping rooms. The stucco was originally kept white, but in the 18th century multicolored and gilded stucco were introduced.

This entire style of interior decoration began to disintegrate with the introduction of European furniture, for which the proportions of the rooms, the position of the windows, indeed the whole concept of the interior, proved unsuitable.

Hermann GOETZ

b. China. In China the conception of interior space includes magical, cosmological elements that, in the protohistoric period, found expression in a type of spatial organization called *Ming-t'ang*. This seems to have been an architectural complex composed of an empty square space, covered in the center by a round roof and enclosed not by actual walls but by four surrounding buildings or rooms oriented according to the four points of the compass. The central space of the *Ming-t'ang* was known as *t'ien-ching* or well of heaven, the axis of the world around which gravitated the various magical planes and from which the occult forces of direction spread.

According to the *Shih-ching* ("Book of Odes" or "Songs"), archaic Chinese interiors (raised, sunken, or half-lowered in the earth) probably had a hole at the top that was connected with the concept of the "well of heaven" or "window of heaven" (*t'ien-ch'uang*) — undoubtedly because of its particular functions as an opening for light and as a conveyer of rain water — and did in fact bear those names. The two elements, light and water, are represented even today on the structural members of some interiors, as for example on the ceiling of the T'ai-ho-tien in Peking (PL. 114), as evidence of an obsolete opening now entirely gone. Similar evidence is presented by the square space between the beams of palace ceilings and in the vaults of Chinese tombs; this space has been called a "well with aquatic plants" (*ch'ao-ching*) because represented there are water plants with roots pointing toward the ceiling and the rest seemingly hanging down into the interior. In other instances, in the palaces and temples of the Ch'ing dynasty (1644–1912), there is represented in the square spaces between beams a coiled dragon which, as an aquatic animal that calls forth hurricanes and rain, symbolizes the well of heaven.

The transition from the hypothetical *Ming-t'ang*, with its sacred central space, to the classic type of dwelling with interior courtyard, or "well of heaven," was undoubtedly brief. Merely enlarging the primitive interior and adding partitions to it was enough to create a dwelling that embodied the scheme of *Ming-t'ang*.

The formal and structural changes which the Chinese interior underwent with the passing of successive dynasties were purely superficial, since the basic principles governing closed space remained the same. Only furnishings and decorations changed, characterizing rooms of different periods according to varying philosophic and religious ideas. The interior of a Chinese house, evolving as the result of many modifications, is a space subdivided into a certain number of independent architectural units, each with a specific function: some rooms are set aside for public life — for receptions, business, and the like — and others devoted solely to the private needs of the immediate family. When circumstances permit, the whole complex is oriented to the south in keeping with ancient geomantic principles. A positive value is accorded interior space in rooms in the public part of the house, that is, in the *ta-t'ing* or main room, in the *shu-chai* or *shu-fang* or library, and even in the *t'ang-wu*, the room of the ancestors. The interior of the *ta-t'ing* is a regular space in which the four piers that support the roof function as standards by which to measure spatial relations in the placement of furnishings and wall scrolls. The back wall, the ideal artistic center of the room, is also important, for in fact it is there that, above a table (*t'iao-chi*) before which another, smaller table is placed (the *pa-hsien-cho* or table of Eight Immortals), a large scroll painting of considerable artistic value (the *t'ang-hua* or hall picture) is hung, lending atmosphere to the interior. In many parts of China the place where the *t'ang-hua* is put assumes a religious significance almost like a family altar, since the little tables of the ancestors (*p'ai-wei*) are set there. Because of its plastered walls and abundant furnishings, the Chinese interior does not appear to have the structural lightness of the Japanese. For example, in the *ta-t'ing* are usually found seats of carved and finely worked black wood set between a series of small tea tables placed against the left wall, numerous scroll paintings (*p'ing-fu*) hung side by side on the other walls, and a carpet covering the floor of beaten earth. The larger *ta-t'ing* are subdivided into seven or more parts by *lo-ti-chao*, a type of wooden partition characterized by intricate openwork. The *lo-ti-chao* link the four piers to the plastered walls, creating graceful arches and connecting the two front piers with the two behind

The interior described above — also related in form to the *shu-chai* and the *t'ang-wu*, and in structure to other Chinese rooms — is obviously the result of a continual modification of the primitive dwelling. At the beginning of the Christian Era and up to the Eastern Han dynasty (25–221), walls played a secondary role in marking out the part designed for official use, since the structure of the rooms was dependent solely on the foundation, the piers, and the roof, the functional division of space being left to mobile rather than to fixed partitions. Such houses contained a principal room or *chung-t'ang*, the direct predecessor of the *ta-t'ing*, flanked on the right by the "west room" or *hsi-t'ang*, and on the left by the "east room" or *tung-t'ang*. The furnishing of these interiors must have been rather simple and of minimum height, since the occupants were constrained to sit on the floor on reed mats or skin rugs. The interiors of this period reflected the Confucian principles of simplicity and restraint, but after the introduction of Buddhism in the Han period, rooms assimilated influences from the sumptuous interiors of temples, such as painted walls and ceilings. During the period of the Three Kingdoms (220–77) and of the Sui dynasty (581–618) such painted surfaces achieved particular elegance, especially in palaces.

During the T'ang dynasty (618–906) there developed an emphasis on the decoration of beams and piers, mobile screens continuing meanwhile to be the most important element of interior decoration, together with the light allowed to enter from the exterior through the trellised framework. During the Northern Sung dynasty (960–1127) interiors had more ample wall space, which was given over to exhibition of scroll paintings, and movable screens ceased to be used as partitions, their dividing function being taken over instead by walls of plastered brick. For the first time in the history of Chinese interior decoration, rooms were furnished with seats and tables of normal height. With the rise of the Ch'an school of Buddhism during the Southern Sung dynasty (1127–1279), substantial changes occurred in the decoration of interiors based on the principle that simple, natural beauty is superior to splendor. Interiors thus lost their magnificence, and a simplicity in furnishing was introduced that had a somewhat monastic quality; walls were freed of their innumerable scroll paintings, and openwork arches and carving on beams and piers were discontinued. During the Ming dynasty (1368–1644) the trend toward revival of classical elements in Chinese culture brought to interiors an austere beauty based solely on form rather than on openwork and carving. High-arched exterior openings reappeared. Beams and piers were hewn of solid trunks of wood, devoid of all decoration, and walls became the predominant structural element in domestic architecture. The simple beauty of the architecture of this period is reflected also in the furniture, the carving of which is reminiscent of the decorative elements in Chou and Han bronzes.

Interiors of the modern period, lacking the creative force necessary for further development, sum up in their standard type the numerous formal and structural transformations of the primitive dwelling.

c. Japan. The spatial conception of a Japanese interior — whether a private or a public building, a Buddhist or a Shintoist temple — has not changed substantially from the first centuries of the Christian Era to the present day. Indeed, reproduced on the *haniwa* of the 5th century are houses of an already established type of form and structure that — except for the changes in interior decoration, which was always rather scant — has been transmitted intact to present-day dwellings. The Japanese do not consider living space as isolated from natural surroundings but as an expression and continuation of these surroundings. The thin wooden walls do not, in fact, lose contact with the exterior, and the movability of the fusuma (opaque sliding doors) and *shōji* (translucent sliding doors) allows for creation of spatial volumes of variable form (PLS. 115, 322–25). It is precisely from this ability to control space that the esthetic principles of Japanese interior design arise.

In contrast to Western and to Chinese interiors, which are composed of separate architectural units, the Japanese interior seems, at first glance, to be a single room without spatial divisions. The absence of fixed dividing elements and the simplicity of a structure free of superfluous decorative elements that might destroy the lightness of the building's lines results in continuity of the natural setting, with which, moreover, the Japanese always feels himself to be in harmony. The Japanese interior is among the simplest that exist; it is devoid of furnishings and of architectural elements common to Western rooms, yet possesses a natural airiness that covers the bareness of the walls and of the space by means of the fragile paper shoji of the veranda (*engawa*) which surrounds the building on three sides.

The post-and-lintel combination is the sole important structural and functional element of the interior, and the Japanese avoid covering it, obtaining thereby a clear intersection of horizontal and vertical lines at right angles. In many cases walls and sliding doors, left in a light color, help to simplify the appearance of the rectilinear structure. In addition, the rectangular mats (*tatami*) that cover the floors in every type of Japanese interior intensify the characteristics of the design; they also suggest a continuation of the closed interior space toward the exterior in a perspectival diminution of lines, enhancing the simple harmony of the supports and confirming the continuity of outside and inside. The post-and-lintel principle is also dominant in furnishings and in the structure of the shoji. In the latter this rectilinear element accents interior space and eliminates monotony, for as the soft sunlight filters through the paper screen covering the wooden framework, the light thus created softens the rigidity of the defining walls and projects a view of the exterior into the enclosed space.

An interior conceived in this manner invites modification of its rectilinear design, and for that purpose there was introduced in the Muromachi (Ashikaga) period (see JAPANESE ART) an asymmetrical structure initially called an *oshiita* and later a *toko-no-ma*. This structure generally takes up about half the width of a wall, being set into a depth of about 24 in. The other half of the wall is occupied by two or more shelves, *chigaidana*, on which art objects are exhibited. In the architectural style peculiar to the houses of the samurai, or *shoin-zukuri*, the *toko-no-ma* was accompanied by a window space set at right angles to the back wall, a feature of the Kuroshoin, or Black Suite, of the Nishi Honganji in Kyoto. The *toko-no-ma* is a decisive factor in establishing the atmosphere of an interior and very often reflects the personality of the owner of the house. In it are exhibited very valuable scroll paintings (*kakemono* or *kakejiku*), decorative pieces, and flowers, all arranged according to the principles of a special art, *ikebana*. In harmony with the changing seasons or according to particular personal feelings, the *kakemono*, hung in the *toko-no-ma*, are meant to re-create the outside atmosphere or to express profound sentiments.

The architecture of traditional Japanese interiors is based solely on wood, and walls do not represent a closed structural unit. The free space of the room, outlined by posts and beams, can either be left open or framed by the sliding doors called fusuma. The *shōheki-ga*, or pictures on walls — a genre of painting that first appeared during the Heian period (784–1185) and attained its height during the Momoyama period (1573–1614) — were executed on or applied to these doors. Since the fusuma occupy most of the interior wall space, the *shōheki-ga* contribute notably to the atmosphere of the room, and in fact the subject matter of these paintings, which includes landscapes, birds, and flowers, enlivens and overcomes the limits set to the interior space.

The Japanese concept of the equivalence of interior and exterior space is best expressed in the interiors of houses used for the tea ceremony, *chashitsu*, since every structural and formal element in these interiors finds justification in that concept. Such a setting is meant to produce a feeling of the greatest possible closeness to nature; for that reason materials almost in their natural state are used — as, for example, stripped tree trunks, stalks of bamboo, and reeds (*tokusa*) — and the walls are covered with earth in order to exhibit the characteristics of natural soil. The *chashitsu* is the best architectural example of Japanese artistic sensibility. Its simplicity is the result of an

UP State Museum, Lucknow

intense study of natural elements arranged to form a beautiful interior that celebrates the beauties of nature. The tea house influenced Japanese domestic architecture, bringing about the appearance of interiors in the *sukiya* style, whose formal and structural elements embrace two tendencies of the Japanese esthetic: the love for all that is at once delicate and strong, and respect for nature.

Antonio PRIORI

Modern interiors. Modern architecture rejects every distinction in principle between interior and exterior space and instead seeks continuity, free articulation, and variable spatial definition through structure, correspondence of size to function, color, and furniture. The gradual liberation from traditional schemes of space formation, accompanied by the gradual supersedure of traditional types, began about the middle of the 19th century with the reevaluation of the structural character of Gothic architecture and with the use of new materials and techniques permitting a freer relationship between supporting elements and empty space. This process of liberation has continued under the influence of new concepts of life and social function, of new techniques of contruction, and of new esthetic values for architecture.

An important element in the transformation of the idea of space in architecture is the radical change in the image of the city (see TOWN PLANNING). The open plan of a city that is functionally organized and continually expanding necessarily eliminates the great palaces and their interior architectural elaboration (such as courts of honor, grand staircases, and splendid ballrooms) and requires a more minute and uniform division of space according to the more modest functions and needs of the middle and lower classes. While the modern social and economic structure, together with the growing expansion of the city caused by industrial development, reduce the space available to the individual family unit close to the so-called "biological minimum," modern architects attempt to reconcile economic needs with the requirements of health and average well-being by fixing the size and area, and at times even the form, of individual rooms in relation to the possibilities for ventilation and insulation. Correspondingly, the home gradually loses all part in the community's productive life, which is increasingly centered in large industrial areas. Social activities that previously revolved about the family, requiring rooms suitable both in size and kind, now take place collectively in places specifically designed for the purpose. Interiors in homes, now for the most part standardized, consist generally of spatial units nearly uniform in size and shape. The architectural arrangement of these units is generally limited to changes in the shape and extent of the sources of light (which tends to be increasingly abundant) and to the coloring and wallpapering of the walls; these variations can render the limits set by the walls less prominent and less oppressive.

Keeping these consequences within the limits of proportion, and hence of practical human use, has been the creative and theoretical contribution of artists and architects of the 19th and 20th centuries. In Europe Morris, Mackintosh, Van de Velde, and Gropius (qq.v.) fought for the creation of dwellings and industrial plants which would be more responsive to human needs and aspirations. The research and achievements of the Bauhaus, and the contributions of Le Corbusier, Mies van der Rohe (qq.v.), Stam, and others, found unanimous support, as manifested especially in the housing exhibitions of the Deutscher Werkbund in Paris and in Berlin, and in the Weissenhof quarter of Stuttgart (1927). At such exhibitions the best European architects expressed their conceptions of the interior in bare, stereometric rooms, in which arrangement, household equiment, and furniture indicated a strong awareness of present-day needs. For problems dealing with the basic living space of domestic dwellings, the model house by Mies van der Rohe exhibited in Berlin in 1931 and his Tugendhat house of 1930 in Brno, with its marvelous interior (X, PL. 57), may be considered the perfect examples and a summation of modern spatial concepts.

In the United States, because of the different organization and needs of American society and the lesser urgency of housing problems, development in domestic architecture took place primarily in suburban dwellings, in contrast to Europe, where experiments were being made primarily with the urban dwelling. Irving Gill and the Greene brothers in California and Wright (q.v.) in the Middle West achieved notable results, especially in their development of relationships between the interior and the natural setting and in the articulation of space. Wright's splendid series of "Prairie" houses testifies both to a mastery of space and to a freedom from the kinds of preconceived schemes which, in part, benefited European thought from 1910 on. Following the 1929 crash, Neutra, Breuer (qq. v.), Schindler, and Wurster created middle-class dwellings of great architectural merit, and Wright approached the problem of middle-class housing with his series of "Usonian" houses, in which a masterly use of materials — stone, brick, wood, and small cement blocks — and spatial control give the interiors an inviting, hospitable atmosphere.

The uniformity of spatial distribution in domestic architecture is compensated for by diversity in interiors designed for collective use. Indeed, the problem of interior space gains most importance in industrial architecture, in great managerial centers, and in schools, museums, and places for sport and entertainment. In industrial architecture interior spaces are determined in their size and shape by functional necessities. Most of the units of industrial machinery — conductors, pipes, ovens, vats, and assembly lines — assume crucial importance even in regard to form, by specifying the size and shape of the interior in relation to a specific function. From the physical as well as the psychological point of view, the sanitary conditions in which work is done are an essential consideration, especially in the more modern industries. This consideration affects not only the conditions of ventilation and lighting but also the size and shape, articulation, and color of the interiors. In other types of buildings having a specific function, the form and division of rooms takes into account not only living conditions but also the requirements of internal traffic (such as in offices and in hospitals), of working speed, and of control. In some buildings, especially in primary schools, the tendency in modern architecture is to seek, besides practicality and the best hygienic conditions, a direct and visual relation between interior and exterior by attempting to eliminate the sense of confinement of a closed space through the use of large openings overlooking areas of greenery. There is a tendency also to focus attention on the functional and psychological problems arising from the teaching program and to give greater consideration to such matters as corridors, colors, and the form of furnishings. Examples of such schools are those designed by Perkins and Wills located in Winnetka (with the Saarinens) and Scarsdale, Illinois, and the school in Suresnes built by Beaudouin and Lods, Jacobsen's school in Denmark, and several built by Neutra. In buildings dedicated to sport, such as stadiums and race tracks, any distinction between inside and outside space is excluded from the start, since these are generally open buildings. Yet spatial continuity is evident to a great extent as well in the auxiliary buildings connected with sports that take place entirely in the open, such as golf and, sometimes, polo.

A special problem in planning is presented by museum interiors. In regard to both form and color, the planning of space in museums is governed by the need to obtain the best conditions of visibility and the most fluid conditions of circulation for visitors. There are many examples of successfully designed museums. The Museum of Modern Art in New York, by Edward Stone with Philip Goodwin, is one of the first examples of a cultural institution designed to fulfill several functions (X, PL. 218). Louis Kahn's art gallery for Yale University has a severe interior notable for its movable exhibition panels, for its imaginative lighting, and for its use of reinforced concrete exposed in a fully equipped ceiling (concealing ducts for utilities) of reticular design (X, PL. 220). Wright in his Guggenheim Museum (X, PL. 217) went beyond the mere function of exhibition space for paintings and sculpture and created a place for contemplation where the interior is conceived as one great island of mystical experience in the city's exhausting turmoil. Franco Albini's Museum of the Cathedral Treasury, Genoa, contrasts the preciousness of gold-

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

smith's work and of wrought silver, the delicate substance of textiles, and the lightness of crystal with the severity of the cylinders of stone that form the boundaries of the surrounding spaces. Finally, the installations and exhibitions set up in historic buildings by Carlo Scarpa attest to the exceptional sensibility of a cultivated and aware artist.

Another essential element in the elimination of the distinction between interior and exterior space is modern architectural technique. The use of metal and of reinforced concrete, both of which perform their carrying function without the help of large masses of masonry, has practically done away with the necessity of walls as elements of support. Now free of all carrying function, walls act as mere dividing screens which, being independent of the static structure, may be distributed according to the economic, practical, and, in some cases, esthetic requirements of the interior space. Separation of interior and exterior is thus generally assigned to large areas of glass that not only secure for the interior the greatest amount of light (regulated by means of curtains of varied thickness and color) but also create the possibility of almost total visual communication between open and closed spaces. For example, the view from an upper story of a skyscraper of the buildings and streets of New York, with their heavy and orderly traffic, is an essential part of the architecture of that structure, just as the view through the windows of Wright's Kaufmann house of woods and a waterfall (I, PL. 91) constitutes an essential element in the architecture of the interior of that building. The fact, too, that these views may represent psychological stimuli to activity or to repose is but confirmation of their esthetic character, since the entire modern concept of art, especially in the field of town planning and architecture, is founded on the direct psychological impact of form and color.

The structural possibilities of modern architecture, besides favoring the predominance of voids over solids, permit a free articulation of plan. The "walled box" as a fixed boundary between interior and exterior is therefore eliminated, and the supporting structural elements, previously set along the periphery or at the principal axes of the room, are now found in the interior. The free or open plan — that is, one independent of structural limits and modeled according to the requirements of family or social life — has given rise to a whole set of new ways to divide and qualify space, with respect to elevation as well as to ground plan. The interior space of modern architecture, especially in suburban and country residences, is in fact characterized not only by direct communication between closed and open spaces, but also by a diversity in the levels of floors and ceilings, by the use of stairs and balconies as plastic forms within the interior, and by the use of furniture as part of the architectural setting. Examples of such interiors are those designed in 1910 and 1912 by Adolf Loos for houses in Vienna, the house of the writer Tristan Tzara built in Paris in 1926, the Kuhner house built near Vienna in 1930, and the Moller house built in Vienna in 1928. Another example is the sequence of circulation and reading rooms in the Municipal Library at Viipuri designed by Alvar Aalto, in which emphasis upon the diversity of levels is accentuated by the great central staircase and the problem of lighting has been brilliantly solved by a series of skylights and portholes in the ceiling. Aalto reuses this principle in the main room of the Old-Age Pension Building in Helsinki, in the entrance hall to the auditorium of the Teacher's University at Jyväskylä, Finland, and in the students' dining room in Baker House at Massachusetts Institute of Technology. As in Mies van der Rohe's Tugendhat house, in Neutra's house in the Colorado Desert, and in Wright's Usonian houses, mobile walls, made primarily of light, luxurious materials, screens, and hangings, cease to be complementary, accessory elements, and become essential agents in the definition and characterization of space. The abundant light created by the free communication between closed and open space also eliminates a traditional distinction between exterior and interior forms, wherein the former are modeled more sharply because they are exposed to the sunlight, while the latter are modeled more delicately, since they are exposed to a weaker, or even artificial, light. In modern interiors one encounters unfinished materials such as exposed stone and brick, or wood still in the form of a tree trunk — as in Wright's Kaufmann house at Falling Water, Pennsylvania; in his Lewis house, Libertyville, Illinois; in interiors by Breuer, Wurster, Harris, and Drake; and in the Municipal Hall in Säynätsalo by Aalto. The colors on walls, previously painted in neutral or tempered tones, now often tend to be bright and vividly contrasting, thus approximating the chromatic effects introduced by modern painting, as evident in the experiments and achievements of the Stijl group, such as Van Doesburg's room decorations at the Aubette dance hall in Strasbourg, Rietveld's Schroeder house in Utrecht, and several buildings by Oud (q.v.).

Floors and ceilings also take on particular importance from the esthetic viewpoint, especially in connection with the definition of interior space as a "volume of light." Floors, functioning in this respect as walls formerly did, generally assume the value of a plane of color, at times through the use of plastic materials and facing. Ceilings normally function as surfaces which reflect both natural and artificial light, sometimes by means of the plastic modeling of the surface. The possibilities offered by modern technology in respect to heating and air conditioning are also factors in the shaping of interior space in modern architecture. To meet the need for maximum plant utilization, modern technology has furnished architecture with still another element determining the arrangement of interiors — the equipped ceiling. It has for some time been standard practice in office buildings, in research laboratories, in meeting halls, and, in some cases, in museums to collect within the ceiling structure itself (often a metal trellis) the pipes for air conditioning, electrical wiring, light panels, and acoustical material. A similar functional approach in the construction of exterior walls — of which Gropius's Bauhaus (VII, PL. 81) and Fagus factory (V, PL. 103) and Le Corbusier's monastery of La Tourette are prototypes — and the light, temporary nature of modern movable partitions used as interior walls help to demonstrate that in these characteristically 20th-century interiors the gravitational function belongs chiefly to the floor. This is also helped by diffused and uniform lighting and by acoustical conditions which nearly destroy the stereometric quality of the enclosure. Evidence of this is found in the General Motors Technical Institute at Warren, Michigan, designed by Eero Saarinen and his associates, Sven Markelius's ceiling for the Economic and Social Council Chamber of the U.N., and Louis Kahn's magnificent ceiling of reinforced concrete for the rooms in the Yale University Art Gallery.

Despite the fact that the need for decoration (in this instance understood solely as the plastic and chromatic variations of exterior and interior surfaces) has been reconsidered by such modern masters as Wright (PL. 116) and Breuer, the problem of the decoration or ornamentation of interiors has been determined from the very beginning in modern architecture by the principle of strict functionalism and the consequent elimination of all applied ornament as nonartistic. Clearly, modern architecture, which defines space through structure, severely limits the intervention of other fine arts, especially when they are closely linked to architecture, as are mural painting and sculpture. To be more precise, the functions of spatial determination once exercised by mural painting and sculpture are now normally carried out directly by the architect through the plastic and chromatic manipulation of structural elements. The same may be said of furniture in so far as it is part of the architecture of the interior space. Whereas some pieces of furniture are adopted as architectural elements and even occasionally integrated into the structure as fixed parts, other pieces are clearly separated from the architectural scheme and have full functional and formal autonomy. Both the mass production of furniture and the search for freedom from formal and proportional relationships to architecture have furthered this autonomy. A typical instance is provided by modern tubular and plastic furniture (see FURNITURE) which, because of its lightness and movability, functions merely as an object in the architectural space of the interior. Design experiments at the Bauhaus and the work of Charles Eames for Herman Miller, Inc., (PL. 51; I, PL. 135) have contributed to this trend.

The most recent experiments with large, concrete, freely modeled surfaces have been directed toward the ever more radical elimination of the distinction between exterior and interior space. The goal of such experiments is, in fact, the reduction of architecture to one great covering surface, beneath which the division of interior spaces and their articulation proceeds absolutely free of all structural demands and is modeled solely according to practical and esthetic qualifications. Konrad Wachsmann and R. Buckminster Fuller are conducting experiments based on the repetition of a single standard metal part with special auxiliary nodal devices in order to solve the problem of the covering of great areas with structures of minimal weight. Fuller's geodesic domes (PL. 62), conceived as partially or wholly transparent envelopes, are intimately connected with problems of interior space and foretell developments of unforeseeable consequence. It is interesting to note the use to which these domes have already been put in Fuller's projects for his Skybreak Dwellings and cotton mill.

IRAN. Iran (Kishvar-i-shāhinshāhī-i-Īrān), or Persia, is an independent Asian country governed by a hereditary constitutional monarchy. The population comprises several ethnic strains, including Iranian (Persian Tajik, Kurds, and Baluchi), Turkish (Azerbaijani and Turkomans), and Arab, all under Persian political and cultural domination. Covering an area of 636,293 sq. miles, Iran is part of the Iranian plateau, bordered by the U.S.S.R., Turkey, Iraq, Pakistan, and Afghanistan.

SUMMARY. Iran and Iranian civilizations: names and subdivisions (col. 212). Historical, cultural, and artistic periods (col. 214). Sites and monuments (col. 219): *Azerbaijan; Kurdistan; Luristan; Khuzistan; Fars and Laristan; Kerman, Baluchistan, and Seistan; Khorasan; Caspian regions; Teheran region; Isfahan region.*

IRAN AND IRANIAN CIVILIZATIONS: NAMES AND SUBDIVISIONS. Only some of the pre-Islamic and Islamic sites important to Iranian history

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

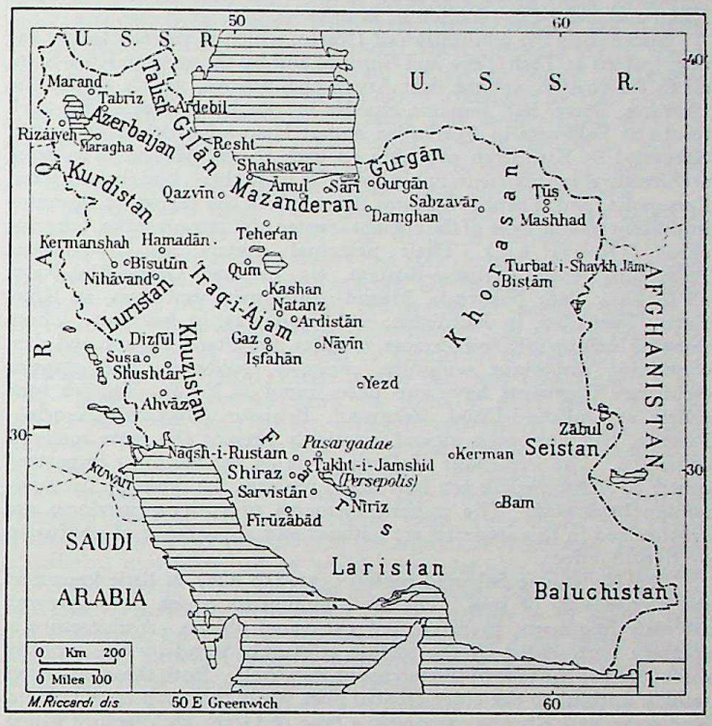
are located within the present boundaries of Iran. Such areas of great archaeological and artistic interest as a large part of Seistan and the Afghan and central Asian parts of Khorasan (see AFGHANISTAN; ASIA, CENTRAL) lie outside the borders of the modern country. Those areas within Iran are, however, among the most characteristic from the archaeological point of view, as they comprise almost all the important sites of Islamic Iran; the most significant centers of pre-Islamic civilizations (those of the Elamites, Urarteans, Medians, and Achaemenids) as well as numerous prominent monuments from the Sassanian period (see SASSANIAN ART) are located in the western regions. On the other hand, only faint traces remain in Iran from the Seleucid period (see IRANIAN PRE-SASSANIAN ART CULTURES), and the centers of Transoxiana and Mesopotamia are as important as Iranian sites for a study of the Parthian period. Persia was one of the most lively and active areas of Islamic civilization, especially after A.D. 1000. When the Sassanian homeland of Fars was abandoned, Isfahan frequently served as the capital — in the Buyid (Buwayhid; 10th cent.) and Seljuk (see SELJUK ART) periods. After the Mongol invasions Tabriz, and Sulṭāniya (see ILKHAN ART) became capitals, then Herat, in the Timurid period (see TIMURID ART), and, under the Safavids (see SAFAVID ART), Isfahan. This city remained the capital until the early 18th century, when, after a brief flowering of the new Fars center Shiraz, Teheran, the present capital, replaced it. Besides Herat (in Afghanistan) the major centers of Iranian Islamic civilizations outside the present boundaries of the country are the central Asian Samarkand, Bukhara, and Merv.

The name Iran (Īrān) comes from the Middle Persian (Pahlavi) Ērān (Iranian nation) as opposed to Anērān (foreigners, barbarians). The Sassanian monarchs indicated the universality of their dominion by calling themselves kings of Ērān and Anērān. The Pahlavi form Erān derives in turn from the ancient Iranian *airyana* (equivalent to later Avestan). The term comes from Airya (peoples of Iranian stock in contrast to Turanians) in the Achaemenian inscriptions (cf. Avestan Airyanem vaējō, legendary homeland of the Iranian people). The ethnic significance of the term is explained by the change from *Aryan*, noble, good, of the primitive Indo-European community, to *Aryan*, the nobility, the ruling population of the Indo-Iranian community. The form Īrānshahr (Iranian region) was used by medieval Arab historians and geographers, and the term Īrān (the Iranian ethnic and cultural unity) was popularized by the poetry of Firdausī (10th cent.). But the common use of Īrān (Iranian country) and Īrānī (Iranian) began only in the 19th century, the time of the formation of an Iranian national consciousness in the modern sense. In Europe, the use of Iran is extremely recent and has had difficulty replacing the traditional Western term Persia, which comes from the Greco-Latin Persae. This term was applied to the Iranian ethnic group in power during the Achaemenian period and derived from the Iranian geographic region of Persis (Pārs; Ar., Fāris; Mod. Per., Fārs), homeland of the Parsua tribe mentioned in the Assyrian inscriptions. However, if the Arabic Fāris indicated only the region of Persis, Fārisī, Fārsī (Pārsi) as early as the ancient period meant a language used throughout the entire plateau, which became, after the 9th century, the language written by most Iranian groups. The Arabic Furs, on the other hand, designates Iranians of the pre-Islamic — or heathen — population, while the Arabic term *al-ʿajam* means a non-Arab, foreign, or barbarian nation and, by inference, Iranian. The term Tajik has many meanings. In ancient times it meant Arab, having derived from Ṭaiy, an Arab tribe neighboring on the Iranian populations; today Tāzī is still the word for the Arabic language. Later the term meant Iranian in opposition to Turk; this usage now prevails, particularly in contrasting Iranians to Turkoman or Uzbek tribes in central Asia and Afghanistan, where Tajik, an eastern Persian dialect, is spoken by Iranian and non-Iranian groups. However, Tajik there is also used in opposition to Pashtu, also an Iranian group, and sometimes in opposition to western Iranian; thus Tajik means "eastern Iranian speaking the Persian language."

The administrative organization of the country has undergone important and repeated changes since its revision in 1938 based on modern standards. The February, 1960, reform abandoned the practice of numbering divisions and divided the country into the following 17 historical regions (*ustān*), listed below with their capitals: Central (Markazi), Teheran; Gilan, Resht; Mazanderan, Sari; Gurgan (Asterabad), Gurgan; Khorasan (Khurasan), Mashhad; Baluchistan and Seistan (Sistan), Iranshahr and Zabul; Kerman (Kirman), Kerman; Fars, Shiraz; Khuzistan, Ahvaz; Luristan, Khurramabad; Kermanshahan (Kirmanshahan), Kermanshah; Hamadan, Hamadan; Kurdistan, Sanandaj; Western Azerbaijan (Ādharbāījān-i-Gharbī), Rizaiyeh; Eastern Azerbaijan (Ādharbāījān-i-Sharqī), Tabriz; Arak (Araq), Araq; Isfahan, Isfahan.

The topographical inventory (col. 219) groups the most important sites in alphabetical order by regions, here reduced to 10 for greater conformity with historical and geographic divisions as well as with the modern political and commercial organization.

HISTORICAL, CULTURAL, AND ARTISTIC PERIODS. The prehistoric period is characterized by a variety of pottery styles (see ASIATIC PROTOHISTORY; IRANIAN PRE-SASSANIAN ART CULTURES) that bear witness to the interweaving of different cultures, sharply contrasting with the stylistic uniformity of neighboring Mesopotamia (q.v.), with which useful comparisons can be drawn in order to establish a relative chronology. Studies completed thus far permit individuation of the cultures of each prehistoric period according to the name of the locality where the principal finds have been made. Traces of the Paleolithic, Mesolithic, preceramic, and ceramic Neolithic are to be found especially in the north, in Ghār-i-Kamarband and Ghār-i-Hūtū in Gurgan and in Tamtama in Azerbaijan (all caves), and in the south at Tang-i-



Iran, chief sites of archaeological and artistic significance. *Key*: (1) Modern national boundaries.

Pabda in Khuzistan. Late ceramic Neolithic is primarily represented by two clearly distinguishable cultures, that of Tepe Sialk I (the first level of the famous excavations of Tepe Sialk near Kashan) and that of Tell-i-Jari B, at a site in Fars. The cultures of the chalcolithic period, extending to the beginning of the 3d millennium, include Tepe Sialk II; Tepe Sialk III; Tepe Hissar I (the first level of the famous excavations near Damghan); Tepe Giyan V, in Luristan; Tepe Musyan; Susa I, in Khuzistan; Tell-i-Mushki; Tell-i-Bakun in Fars; Anau II, on the eastern borders of Iran and now in Soviet territory; Shāh Tepe Buzurg and Tureng Tepe in Gurgan; Tepe Sialk IV; Intermediate Susa; Tell-i-Kaftari. The early Bronze Age is represented by Anau III, Tepe Hissar III, Tepe Giyan IV, Susa II, Tell-i-Qal'a in Fars, and the culture of the Bampur-Khurab region in Kerman; the middle Bronze Age, by Tepe Giyan III and Tell-i-Shugha in Fars; and the late Bronze, Age, to about 1200 B.C., by Tepe Giyan II and Tell-i-Taymuran A in Fars.

The Iron Age, 1200–800 B.C., is primarily represented by the famous Luristan bronzes which first appeared in the hands of Teheran antique dealers between 1928 and 1930; coming from tombs in the Luristan valleys of Harsin, Khurramabad, and Alishtar, they soon enriched museums and private collections, alongside similar objects of varied provenance. The Luristan bronzes include weapons, horse trappings, pins, votive and ritual objects, and utensils with somewhat naturalistic or stylized decoration; they evidence a relation to Hittite work. They may be attributed to the period 1200–1000 B.C., although some scholars advance the end date to the mid-8th century. The cultures of Tepe Sialk V and VI can be associated with them, as well as the gold and silver objects from Kalar Dasht, Khurvin, Hasanlu, and Zawiyeh (Ziviya), all of which are in northern Iran. (These cultures also are represented at other sites; for the most important sites see under the individual entries.)

Elamite civilization is the first historical culture in Iranian archaeology. It relates so closely to the Mesopotamian that it is often difficult to distinguish its specific features. Developing from the 3d millennium to the 7th century B.C., it was influenced successively by southern

Mesopotamia, the art of Ur, and the art of Assyria and reached its apogee in the 13th–12th century B.C. Although its center was in southwestern Iran, there are traces in other regions as well. With this culture appear for the first time the rock reliefs — 16 in all — of religious and royal subjects, which were to play an important part in the history of Iranian art. The principal Elamite centers are Susa, the capital, with architectural remains, ceramics, sculpture, gold- and silverwork, ivories, and seals; Chuga Zanbīl, with a ziggurat and finds of every sort, as rich as those of Susa; Rishahr, on the coast of the Persian Gulf; Tell-i-Ghazir, with architecture and ceramics; and Tulaspīd, in Fars, with architecture. Rock reliefs have been found at the following sites: Kurangun and Naqsh-i-Rustam in Fars; Shikaft-i-Salman, Qul-i-Fara, and Qal'a-i-Tul in Khuzistan; Hurin Shaykh Khān and Sar-i-Pul-i-Zuhab in Kurdistan.

Succeeding the civilization of Urartu, which is represented by the inscriptions at Tash Tepe and Siqindil and by the stele at Kīl-i-Shīn, all in Azerbaijan, are the first Aryan civilizations, which, unlike the Elamites, have left remains chiefly in northern Iran. The rock tombs at Fakhraka in Azerbaijan and at Uṭāq-i-Farhād, Sakhna, and Sakavand in Kurdistan probably go back to the Medes. The same architectural motifs are found in Fars: Dā ū Dukhtar, Naqsh-i-Rustam, Persepolis, and Takht-i-Rustam; the south is the region of the most important monuments of the ancient Iranian civilization of the Achaemenids (550–331 B.C.). Their principal centers are Pasargadae, Persepolis, Abarj, Naqsh-i-Rustam, Jin Jin, and Qaṣr-i-Abū-Naṣr, all in Fars; Badr Nishanda, Masjid-i-Sulaymān, and Susa, in Khuzistan; Hamadan, in Kurdistan; and Dumaviza, in Luristan. These remains include fortified terraces, temples, fire altars, palaces, and sites containing important sculpture, ceramics, goldwork, and glyptics (sculpture fragments have also been found at Yezd). The 10 rock reliefs at Dukkān-i-Dāūd, Sakavand, Behistun (Bisutun), Naqsh-i-Rustam, and Persepolis almost invariably present the same scene of adoration. The Persepolis of Darius I is by far the most important center of Achaemenian art; here stone replaces the typically Mesopotamian brickwork. The esthetic elements of various provinces are synthesized in this imperial art without any appearance of confusion or hybrid effect.

The Hellenistic Seleucid period (331–250 B.C.), is little known in the archaeology of Iran. The few monuments which have survived are only fragments; there are few excavated objects. Architecture is sparsely represented by the temple at Nurabad and by one recently discovered at the foot of the terrace at Persepolis. Both these buildings remain faithful to the older Iranian plan, while the temples of Istakhr, Kangavar, and Khurha exemplify a type of Greek architecture whose canons have been freely interpreted. In sculpture the Hellenistic influence is felt more explicitly; in fact, these works are Hellenistic in the cosmopolitan sense. Examples are found at Dinavar, Nihavand (Nehavend), Persepolis, Shami, Susa, and Tell-i-Zuhak. The scant sources of numismatics and ceramics are the excavations of Persepolis, Susa, and Rayy (Rhages). Only two reliefs are extant, both on the door of the temple at the foot of the terrace at Persepolis.

Parthian art (250 B.C.–A.D. 224) was part of a vast culture complex stretching from Syria to the so-called Greco-Bactrian area (see BACTRIAN ART). The artistic revolution effected in this period was destined to furnish motifs for the entire Iranian Middle Ages. Fired or unbaked brick was substituted for stone, and the vault, the dome, and the liwan came into use. The liwan, a vaulted chamber completely open on one side, was to remain for centuries the architectural symbol of Iranism. Little remains of the late-antique rigid sculptural decoration. The round cities and their temples have barely survived; the most imposing ruins are those of Kuh-i-Khwaja in Seistan, where examples of sculpture, wall painting, stuccowork, and ceramics also were found. Other architectural centers are Takht-i-Sulaymān in Azerbaijan and Shami in Khuzistan, which is better known for its statues and bronzes. Susa yields examples of every kind of art, while Badr Nishanda has sculpture, as does Hamadan, where the famous stone lion was found. At Damavand (Demavend) and Rayy, near Teheran, were found ceramics, glyptics, and coins; at Qaṣr-i-Abū-Naṣr, glyptics and coins; at Burujird, bronzes like those from Shami; at Nihavand, examples of goldwork; at Narishan, Tepe Bulahya, and Makran, ceramics. The nine extant rock reliefs from the Parthian period depict scenes of homage, victory, worship, and horsemanship, and are found at Bisutun (Behistun) and Sar-i-Pul-i-Zuhab in Kurdistan and at Shimbar and Tang-i-Sarvak in Khuzistan. The remains of Parthian art which have been found in Iran are qualitatively as well as quantitatively inferior to those revealed by excavations in Mesopotamia, especially at Hatra.

Of all the pre-Islamic historical periods, the Sassanian (see SASSANIAN ART), has left the most important remains on the plateau, although the chief surviving architectural monument, the palace of the de facto capital Ctesiphon, is outside the political and physical boundaries of Iran, in Mesopotamia. Sassanian architecture is known chiefly from the ruins of palaces, fortresses, fire temples, and *chaḥār ṭāqs* (small, open buildings formed by four piers supporting a dome and used for public cult ceremonies), as well as from numerous bridges and dams, in which Roman methods of construction are to some degree evident. The dome-on-a-square plan is found everywhere, as is the liwan. Brick and stone are used for construction, and decoration is painted or of stucco, occasionally mosaic. Sculpture is almost exclusively represented by rock reliefs, of which 30 are known. They are concentrated in Fars, from the oldest at Firuzabad to the latest at Bishapur, but scattered examples are found elsewhere, at Hang-i-Nauruzi in Khuzistan, at Shapur (anc. Salmas) in Azerbaijan (a relief in very poor condition) and, particularly important, at Ṭāq-i-Bustān in Kurdistan. The famous Ṭāq-i-Bustān hunting scenes of Khusrau II, of the 7th century of our era, represent an advance over the immobility of the nationalistic victory scene of the Sassanian king Shāpur over the Roman emperor Valerian, which was endlessly repeated everywhere, along with investitures, triumphs, and ceremonies. This art, consciously and officially Iranian in content and iconography, emulates Rome in its imperial spirit while showing the attitudes and universality of Sassanian civilization. The eastern, or Sassanian, empire and the western, or Romano-Byzantine, empire appear to be two complementary worlds, still politically distinct but both culturally immersed in that late-antique atmosphere which, in art, represents the end of the classical world and leads directly to the Middle Ages. Sassanian silverwork is of particular interest; most of that in Iran comes from the Caspian regions. Textiles are also important, especially for the extensive influence of their decorative motifs, generally enclosed within central medallions; they come from various regions of Iran. Coins provide invaluable evidence for dating the surviving monuments of Sassanian art by a comparison of the characteristic heraldic motifs of the individual kings. There are also glyptic and ceramic finds. Those sites connected with the Sassanians are, for the most part, concentrated in Fars and Khuzistan. All the other important centers are either in western Iran — Shapur and Takht-i-Sulaymān in Azerbaijan; Qaṣr-i-Shīrīn, Haush Quri, Ṭāq-i-Girra, Harsin, and Ṭāq-i-Bustān in Kurdistan — or in central Iran: Kalar Dasht, Shahristanak, Rayy (Rhages), Varamin, Takht-i-Rustam, Takht-i-Kayka'us, Naysar, Atashkuh, Natanz, and Yezd-i-Khast. In eastern Iran Sassanian remains are found at Nishapur and Qal'a-i-Dukhtar in Khorasan and at Karku in Seistan.

Stylistic and technical continuity exists in all forms of Iranian art and is particularly evident in architecture. It has been suggested that Iranian art reacted to the influence of Islam (q.v.), but this was not the case; Islamic art in a pure state did not exist prior to contact with Iran. Characteristic of Islamic art is its successful and total fusion of the two stylistic complexes mentioned above — the Hellenistic Romano-Byzantine and the Hellenistic Irano-Asiatic. For this reason the "Arab" style of Islamic architecture, represented principally by the portico mosque (Iranian examples include the Tārīkh Khāna at Damghan, 735–86, the Jāmi' at Nayin, of ca. 960, and the Jāmi' at Damavand, 9th cent., as well as other later structures), is merely its archaic style, in which the influence of the Western world still strongly predominates. On the other hand, the "Iranian" style based on dome and liwan became the classic style par excellence of the Islamic world after the fusion had taken place (examples include the Jāmi' at Niriz, with liwan, 951; the domed halls of the mosques at Gulpaygan, Qazvin, Ardistan, and Isfahan and of the Ḥaydariya at Qazvin, 12th cent.). This style was diffused throughout the Islamic world — India, central Asia, Turkey, and Anatolia, and even Mameluke Egypt (see MAMELUKE ART) — especially between the 11th and 15th centuries. Iranian Sassanian models may even have inspired some of the oldest Persian mosques. As a matter of fact, the Masjid-i-Rasūl at Bam in Kerman, 650, the mosques at Kaj near Isfahan, 700 (?), at Tabriz, 8th century, and at Shiraz, 894, can be traced back to the type with an isolated pavilion consisting of either a domed chamber or a liwan; the surviving examples would indicate that a liwan oriented toward Mecca was most characteristic.

The classic Iranian mosque, however, is not of this type but is a later evolution of it. It results from an insertion of the mosque with domed chamber into a complex of a square court with four liwans, probably of the type usual in Iranian secular architecture (at least in Khorasan) before the Mongol invasion. Such a plan with four liwans, one in the center of each side, is a constant in classic Persian architecture, both religious and secular, in madrasahs and caravanserais. The domed chamber of the earlier mosque is now placed behind the principal liwan and becomes the sanctuary of the new large mosque, which fills the space remaining between the liwan and exterior walls with vast halls separated by walls or divided into corridors by columns or piers. This transformation appears to have occurred chiefly in the region of Isfahan in the course of the 12th century; its earliest example is the Masjid-i-Jāmi' at Zavara. In Ardistan and Isfahan, as in Natanz, Gulpaygan, and Sava, the court with four liwans was added to the existing sanctuaries.

Khorasan, on the other hand, continued for some time to build mosques with plans differing from the madrasah type: those of Farumad, Gunabad, Zuzan, Nishapur, and Sabzavar have courts with only two liwans. This continued until the 15th century, when an architect from Shiraz built the Mosque of Jauhar Shād in Mashhad. The basic difference between the classic religious architecture of west-central and that of eastern Iran stems from this time. However, both regions continued to build some mosques with isolated pavilions, as at Rizaiyeh, Yezd, and Simnan.

Except for the decoration, mosque, madrasah, and caravanserai maintain the classic pattern almost unaltered throughout the 19th century. Only the dome tends to be transformed from an architectural, spatial element to one which is also decorative and linear, developing from the moderate suggestion of bulbousness of the Mausoleum of Tamerlane (Tīmūr Lenk) at Samarkand to the bulb of the Imāmzāda Shāh Chirāgh of Shiraz, as well as to the unpleasing instances of tortuous virtuosity to be found in some minor and provincial architecture. Architectural decoration employs three chief media: stucco, brick, and kashi (luster tile). The masterpieces of kashi and of the colorful Iranian architecture are the Masjid-i-Kabūd, or Blue Mosque, of Tabriz (15th cent.) and numerous religious buildings in Isfahan, notably the Darb-i-Imām and the Hārūn-i-Vilayat. The minaret is a feature closely connected with the mosque but not limited to it. In the Seljuk period it was often isolated and independent, rising starkly out of the ground (the earliest example is at Kashan), with simple brick decoration, of which the most perfect is at Sin near Isfahan. Later twin minarets are used at either side of the Ilkhan portals, which are decorated with kashi; perhaps a prototype is that of Ardistan.

The other type of building, continuing throughout the Iranian Middle Ages and found in practically every region, is the funerary monument. Its basic form is a dome raised on a base which was no longer only square, as in the Sassanian period (and still found, for example, at Maragha), but took a variety of forms, including the circular, as at Damghan, Lajim, Resget, Rayy, Varamin, Darjazin, and West Radkan; pentagonal, as in the much later Safavid tomb of Bābā Rukn al-Dīn at Isfahan; octagonal, the most common form, as in Shahristan, Turan-i-Pusht, the Gunbad-i-Jabaliya at Kerman, all Seljuk buildings, and the famous tower of East Radkan, 13th century; circular on an octagonal base, as in the Mausoleum of Öljeitü (Uljeitu) at Sulṭāniya, 14th century, and the funerary tower at Ahangan of the Timurid period; ten-sided, as at Bistam and again at Maragha; twelve-sided, as in the Imāmzāda Hūd of Darjazin; and even rectangular, as at Sarakhs. Funerary towers with conical or pyramidal roofs also appear frequently, especially in the north.

Around the tomb or mausoleum are sometimes formed entire architectural complexes, as in the great centers; the finest Ilkhan example is at Bistam, but those of the Timurid period are perhaps more numerous. The sanctuary of ʿAbdullāh Anṣārī at Herat is most famous, but there are also similar fine examples in Iranian Khorasan at Tayabad and at Turbat-i-Shaykh Jām; the complex of the Ḥaram at Mashhad has a unique position, while that of Mahan near Kerman is of less architectural interest.

Less important forms of religious architecture are the *muṣallā*, a kind of chapel, and the khankah (*khānaqāh*), a monastery; they too are essentially based on the dome and liwan. The great liwan of the Muṣallā at Mashhad and the dome of the khankah at Safiabad near Simnan were, until a few years ago, among the most interesting extant structures in Iran. The *imāmzāda*, or saint's tomb, in Persia, roughly corresponding to the western Islamic *marabut*, has no special architectural plan of its own.

Of the few important remains of secular architecture from periods preceding the Safavid, many have undergone subsequent restoration. The villa at Bayramabad near Kerman is perhaps the best among these remaining edifices, besides the more famous ones of Isfahan. The villas at Shiraz and at Teheran and the surrounding area are later; the most beautiful example of the Qajar period is the Bāgh-i-Fīn near Kashan. The style of late Persian garden architecture still survives, as in the pavilion on the little island in the middle of the Iṣtakhr-i-Shāh of Tabriz and in numerous examples of rustic architecture, at times very humble, in the villages. Even these, however, can well bear comparison with the official constructions of Riẓā Shah's Teheran; always dependent upon European influence, these late buildings are all the more eclectic when based on Achaemenian or, less frequently, Sassanian models.

The various phases of modern European influence must be distinguished. At times the Qajar secular architecture of the 19th and early 20th centuries is blended rather harmoniously with architectural elements of Russian character. The first Qajar phase is the most spontaneous and attractive and the most influenced by Russia, through central Asia rather than the Caucasus, and through the new urban complexes of Tashkent and Samarkand as well. There followed a more conscious phase of westernization, but only very recently was a more functional style adopted for public buildings, in which an occasional attempt is made to interpret the liwan in a cosmopolitan idiom, as in the mosque of the University of Teheran.

Following the example of Teheran, both large and small cities are in the process of eliminating the mud-built urban agglomerations by opening large avenues, often planted with trees; these intersect or meet in a central square and end in circular plazas (*falaka*); the squares and plazas rarely have fountains but always are landscaped and occasionally are decorated with a monumental bronze statue of one of the two most recent rulers. Usually paved with asphalt and varying in number according to the importance of the city, the principal streets are lined with shops, mostly of one story only, or open into the bazaars, with domes constructed like those of earlier times, and into little streets. High walls usually conceal the gardens from passers-by. Comparison with such Afghan cities as Herat, which have not undertaken modernization, reveals the social advantages and extent of the esthetic transformation produced by this leveling process, which has made all the large and middle-sized cities of Iran almost identical. The "old" cities predate the others only in so far as they contain structures older by some decades, among which are the significant monuments in the more famous centers.

The cultivated plot, the orchard, and the wood are jealously enclosed even outside the city. The fields are fortified oases in the midst of the steppe and the desert and look ancient even immediately after construction. The towns emerge like islands with their caravanserais, great ovens, and inns, the domes of cisterns with their air towers, and the great dovecots so common in central Iran, occurring as round towers at Isfahan and as fortresses of Assyrian type on rectangular bases toward Tabas in the east and Gulpaygan in the west. Everywhere are scattered the ruins of mud huts; they are never repaired by their poverty-stricken inhabitants, but are simply abandoned when they begin to crumble and rebuilt a few steps away.

The important sites for monuments of pre-Islamic Iran are almost wholly concentrated in western Iran, with the single important exception of Kuh-i-Khwaja. Aside from Tepe Sialk and Tepe Hissar they are, more precisely, in the regions of Kurdistan, Luristan, Khuzistan, and Fars, all of which are relatively poor in Islamic monuments (with the exception of Hamadan, Shiraz, and Niriz). The Islamic period is represented almost exclusively in central Iran and Khorasan; the Caspian regions present only their many famous mausoleums, although they furnish the major finds of gold- and silverwork from the pre-Islamic period.

SITES AND MONUMENTS. *Azerbaijan.* Ardebil (Ardabil). In the Islamic Middle Ages this city was the regional capital alternating with Maragha. Destroyed by the Mongols in 1220, it regained its importance under the Safavids, whose line originated here at the beginning of the 14th century. In the time of Shah 'Abbās I (1557–1629) it was still among the most flourishing cities of the empire. The few important monuments which have been preserved include the Masjid-i-Jāmi' of the 14th century; the contemporaneous tomb of Sheik Jibrā'īl (perhaps the father of the founder of the Safavid dynasty), about 4 miles north of the city; and the notable architectural complex of the tombs of Sheik Ṣafī, the earliest eminent ruler, and of Ismā'īl, the first *shāhinshāh* of the Safavid dynasty. Although the earliest portions of the sanctuary of Sheik Ṣafī belong to the latter half of the 14th century, many alterations were made in the 16th and 17th centuries (PL. 160). The shrine is of greater historic and religious interest than artistic importance; its library was taken to St. Petersburg in the early 19th century.

Siroux, La Mosquée Djoumeh d'Ardabil, BIFAO, XLIV, 1947, pp. 89–100; I. Dībāj, Rāhnumā-i āthār-i tārikhī-i Ādharbāījān-i sharqī (Guide to the Monuments of Eastern Azerbaijan), Tabriz, 1334 A.H. (1955), pp. 52–91.

Fakhraka. This site is south of Lake Urmia in the vicinity of Tash Tepe. Notable is a rock-carved tomb of the Median period comprising an open portico with two columns and a three-column funerary chamber containing three burials.

BIBLIOG. E. E. Herzfeld, Iran in the Ancient East, London, 1941, pp. 202–03.

Geoy Tepe (Gök Tepe). A site in the Lake Urmia region, Geoy Tepe has yielded material documenting prehistoric contacts between Iran and Anatolia. The excavations, in which eight levels have been distinguished, have brought to light pottery connected with that of Tepe Giyan I and Tepe Sialk II and III and important sculptural fragments (ca. 1000 B.C.).

BIBLIOG. T. Burton-Browne, Excavations in Azerbaijan, 1948, London, 1951.

Hasanlu. This site is in the region of Sulduz, about 30 miles southwest of Rizaiyeh. It has an important necropolis where ceramics, bronzes, and jewelry connected with Tepe Sialk A and B, Tepe Giyan I, and with such Anatolian sites as Alisar have been recovered. In 1950 a gold bucket was found here.

Khiav. About 105 miles northeast of Tabriz, this site has a tomb tower known as Sultan Ḥaydar's, which is cylindrical outside and dodecagonal inside (ca. 1330).

BIBLIOG. D. N. Wilber, The Architecture of Islamic Iran: The Il-Khānid Period, Princeton, 1955, pp. 175–76.

Maragha. This important city about 80 miles south of Tabriz flourished in the Ilkhan (Mongol) period. It is particularly famous for its characteristic tomb towers with crypt and chapel underneath, which date from A.D. 1147–1328: Gunbad-i-Surkh, of rectangular plan (ca. 1147); Gunbad-i-Kabūd (said to be the tomb of Hūlāgū's mother), polygonal in plan (ca. 1197); Gunbad-i-Ghaffāriya, of rectangular plan (ca. 1328); the Joi (Göj) Burj, with cylindrical exterior, now in ruins (ca. 1330). The ruins of Hūlāgū's astronomical observatory (ca. 1258) are also important.

BIBLIOG. J. von Hammer-Purgstall, Geschichte der Ilchane, II, Darmstadt, 1843, pp. 98–184; V. Minorskii, Poezdka v Maragu (Voyage to Marāgha), Izvestiya shtaba kavkazkogo voennogo okruga, XX, 1907, pp. 34–56; A. Godard, Les monuments de Maragha, Paris, 1934; A. Godard, Notes complémentaires sur les tombeaux de Marāgha, Āthār-e Īrān, I, 1936, pp. 125–60; I. Dībāj, Rāhnumā-i āthār-i tārīkhī-i Ādharbāījān-i sharqī (Guide to the Monuments of Eastern Azerbaijan), Tabriz, 1334 A.H. (1955), pp. 35–44.

Marand. This city is about 45 miles northwest of Tabriz and contains a Masjid-i-Jāmi' of rectangular plan, with a sanctuary which may have Seljuk and Ilkhan decorations (mihrab, ca. 1330). About 8 miles to the north is an important Ilkhan caravanserai (ca. 1330–1335).

BIBLIOG. D. N. Wilber, The Architecture of Islamic Iran: The Il-Khānid Period, Princeton, 1955, pp. 172–73, 176–77; M. Siroux, La Mosquée Djumeh de Marand, Arts Asiatiques, III, 1957, pp. 89–97.

Rizaiyeh (Rizā'iya). This important city is near the west shore of Lake Urmia. Within both the city and its environs lives an important Chaldean minority group; the city and neighboring villages thus contain numerous Christian churches (Catholic and a few Nestorian), although these are modern and of minor architectural interest. There are two notable Islamic monuments, a Seljuk mausoleum known as the Si Gunbad, and the Masjid-i-Jāmi', with a Seljuk domed sanctuary similar in structure to the mosque at Qazvin, and its contemporary mihrab over which was built another in 1277, apparently the earliest extant Ilkhan mihrab.

Inst. of Iranian Art and Archaeol., V, 1937, pp. 38–42.

Sujas. A site in the region of Sulṭāniya, Sujas contains a Masjid-i-Jāmi' with a Seljuk domed sanctuary of the Qazvin type, built about 1100, and a stucco mihrab of 1290.

BIBLIOG. D. N. Wilber, The Architecture of Islamic Iran: The Il-Khānid Period, Princeton, 1955, p. 118.

Sulṭāniya. Now a modest village, in the Ilkhan period it was the capital. It contains the very famous tomb-mosque of Öljeitü (Uljeitu; VII, PL. 400), built between 1307 and 1313, originally intended to receive the relics of the Shiite Imams. It is among the masterpieces of Ilkhan architecture, comprising an octagonal core with interesting structural variations and eight minarets; it is richly decorated. Also in the city is the octagonal tomb of Chelebi Oghlu; nearby are remnants of the arches and liwan of a khankah (ca. 1330–33).

BIBLIOG. M. Dieulafoy, Mausolée de Chah Koda-Bende, œuvre du XIII siècle, Rev. générale de l'arch. et des travaux publics, X, 1883, pp. 98–103, 145–51, 194–98, 242–43; D. N. Wilber, The Architecture of Islamic Iran: The Il-Khānid Period, Princeton, 1955, pp. 139–41, 173.

Tabriz. The second city of Iran, it was a flourishing capital in the Ilkhan period (especially under Ghāzān, 1295–1304) and in the Turkoman period (15th cent.). It was also the capital of the first Safavids, until Shah Ṭahmāsp I moved the court to Qazvin. Today Tabriz is a very lively cultural and political center, in some respects rivaling Teheran. Unfortunately earthquakes have spared only a few of its medieval monuments. Although the most famous monument, the Masjid-i-Kabūd (Blue Mosque) erected under Jahān Shah in 1465–66, is badly ruined, its great portal, the lower section of the prayer hall, and a few piers and arches from the courtyard have been preserved with careful restoration. The building is as important for the uniqueness of the plan and the architectural proportions as for what is probably the most perfect surviving example of *kashi* decoration in all Iran. The Masjid-i-Jāmi', of historical interest, has been completely altered. The remains of the Masjid-i-'Alī Shah are impressive for their unusually large dimensions; the

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

building was later transformed into a citadel (Arg) and is so called today (1310–20). About 2 miles west from the center of the city are almost unrecognizable traces of the complex at Ghāzāniya, and a short distance to the east are ruins connected with the construction of Rab'-i-Rashīdī (ca. 1300). In the modern rebuilding of the city of Tabriz there are certain interesting examples of secular architecture. The city has the best example in Iran of a public city park, the Bāgh-i-Gulistan, with pavilions influenced by eastern European models.

Takht-i-Sulaymān. This site about 45 miles southwest of Miyana is the ancient Parthian Phraaspa, from which remain numerous ruins of various pre-Islamic periods, all situated around a crater lake. The city walls are about 4,000 ft. in circumference, about 15 ft. thick, and some 45 ft. high and have two doors and 27 towers; inside are a large fire temple and various palaces. Among other very recent finds is a well-preserved fortress. Within the city are also the ruins of a palace of Seljuk origin which was rebuilt in the Ilkhan period (1265–81).

Bibliog. M. Crane and D. N. Wilber, Preliminary Report on Takht-i Sulayman, 2–3, B. Am. Inst. of Iranian Art and Archaeol., V, 1937, pp. 71–109; D. N. Kurdistan. Behistun (Bisutun). A site some 25 miles east of Kermanshah, it is most famous for the well-known Achaemenian relief, carved about 195 ft. up on a rock wall, which shows Darius I triumphing over Gaumata and adoring Ahura Mazda (Ormazd); it bears the very famous trilingual inscription — Old Persian, Neo-Babylonian, and Neo-Elamite — celebrating the family and the glory of the ruler. Part of the Neo-Elamite inscription was erased in ancient times in order to make room for the figure of Skunkha the Śaka. Two Parthian reliefs with two Greek inscriptions are found closer to the valley. The first, a homage to Mithridates (123–88 B.C.), is the earliest known from this period, though it was mutilated by the addition of a Modern Persian inscription in the 18th century; the other represents the triumph of Gotarzes II (A.D. 38–51). In the same area are a block with a figure bearing incense before a fire altar and two decorated capitals (today removed) of the Ṭāq-i-Bustān type. Nearby is the Hunter's Cave (so named by Carleton S. Coon), of prehistoric and protohistoric interest.

Benedict and E. von Voigtlander, Darius Bisutun Inscription, Babylonian Version: Lines 1–19, J. of Cuneiform S., X, 1956, pp. 1–10.

Darjazin. About 3 miles east of Razan (east of Hamadan) is Darjazin, with the Imāmzāda Hūd and the Imāmzāda Azhar, both of the Ilkhan period.

Bibliog. D. N. Wilber, The Architecture of Islamic Iran: The Il-Khānid Period, Princeton, 1955, p. 189.

Dukkān-i-Dāūd. Located about 2 miles southeast of Sar-i-Pul-i-Zuhab, it has a rock-carved tomb with a rectangular portal, at the sides of which are two bases and two column capitals, and behind which is the funerary chamber. Below the tomb is a relief called the Kīl-i-Dāūd (stele of David) with a religious representation from the Median period (7th–6th cent. B.C.). Another unfinished tomb of the same type, the Uṭāq-i-Farhād, is nearby.

Bibliog. H. C. Rawlinson, March from Zohab to Khuzistan, J. Royal Geog. Soc., IX, 1840, pp. 38–39; L. Vanden Berghe, Archéologie de l'Iran ancien, Leiden, 1959, p. 103.

Hamadan. Capital of the region of the same name, this is the ancient Ecbatana, capital of the Medes. Because the modern city, one of the most important in Iran, was built over the ancient, the latter has been very little excavated. Finds have been due mainly to chance, but have yielded Achaemenian gold jewelry, such as the treasure in the Vidal Collection, New York, a fragment of Achaemenian sculpture, and two bronze heads of the 13th–12th century B.C. Southeast of the city is a great stone lion called the Sang-i-Shīr, much ruined and perhaps from the Parthian period. The building called the Gunbad-i-'Alaviyān is a mausoleum of either the Seljuk or the Ilkhan period; its dome has fallen, but its decoration is important. The so-called "tomb of Esther," of the 7th century A.H. (13th cent. of our era), is an important local Jewish shrine and contains a wooden casket of the 8th or 9th century A.H. (14th or 15th cent. of our era). The Burj-i-Qurbān, a very much restored twelve-sided tower, and the structure termed the Buq'a-i-Hidhr, ornamented with elegant Kufic inscriptions, are also important monuments. The Mausoleum of Avicenna (Ibn-Sīnā), constructed in 1952, is an example of the "new architecture" but derives its inspiration from the Gunbad-i-Qābūs; it has an important library. A star-shaped city plan centers at the Maidan-i-Pahlavi, where the most important buildings are located. Of recent construction are the American Hospital and the Dānishgāh-i-Ibn-Sīnā (Avicenna University).

Bibliog. H. C. Rawlinson, Memoir on the Site of the Atropatenian Ecbatana, J. Royal Geog. Soc., X, 1841, pp. 65–158; A. F. Rabino di Borgomale, Hamadan, Rev. du monde musulman, XLIII, 1921, pp. 221–28; E. E. Herzfeld, Die Gunbadh-i Alawiyyan und die Baukunst der Ilchane in Iran, in A Vol. of O. S. Presented to E. G. Browne, Cambridge, 1922, pp. 186–99; M. T. Mustafawī, Hagmatana, n.p., 1332 A.H. (1953); D. N. Wilber, The Architecture of Islamic Iran: The Il-Khānid Period, Princeton, 1955 (reviewed by M. B. Smith, JAOS, LXXVI, 1956, pp. 243–47).

Kangavar. This site is about 55 miles west of Hamadan. Within the walls of certain buildings are set Doric capitals and Corinthian abaci — the remains of columns from a Seleucid temple of Anahita (ca. 200 B.C.).

Bibliog. M. Dieulafoy, L'art antique de la Perse, V, Paris, 1889, pp. 8–11.

Kermanshah. Capital of the region of Kermanshahan, it is known especially for the Sassanian complex of Ṭāq-i-Bustān in the immediate vicinity. No noteworthy Islamic monuments remain.

Bibliog. H. L. Rabino di Borgomale, Kermanchah, Rev. du monde musulman, XXXVIII, 1920, pp. 1–40.

Qaṣr-i-Shīrīn. This site lies about 15 miles from the Iraqi border on the main Kermanshah–Baghdad road. It contains a Sassanian fire temple called the Chaḥār Qāpū, a large building of square plan with four doors, as well as a ruined palace called the 'Imārat-i-Khusrau, with a dome and liwan; the complex belongs to the period of Khusrau II (590–628).

Bibliog. G. L. Bell, Palace and Mosque at Ukhaiḍir, London, 1914.

Sakhna. A site on the road between Kermanshah and Kangavar, Sakhna has a rock-carved tomb, perhaps of the Median period, said to be that of Farhād and Shīrīn. Its entrance is flanked by two columns and surmounted by the symbol of Ahura Mazda. The interior includes a vestibule with two niches and a passage leading into a lower chamber, perhaps intended for the burial of a more important person.

Bibliog. W. Inz, Zur iranischen Altertumskunde: Ein wieder aufgefundenes medisches Felsgrab, ZMG, XCIII, 1939, pp. 363–64.

Sar-i-Pul-i-Zuhab. This site lies about 20 miles southeast of Qaṣr-i-Shīrīn. On the rock face are four reliefs, the most important of which belongs to the Elamite period and dates from the late 3d millennium (3d dynasty of Ur); it is divided into two scenes and bears an Akkadian inscription. Two other reliefs are similar but more modest; the fourth, of the Parthian period, also bears an inscription.

Bibliog. E. E. Herzfeld, Am Tor von Asien, Berlin, 1920, pp. 3–5, 53.

Ṭāq-i-Bustān. About 3 miles northeast of Kermanshah, this site contains the most interesting examples of Sassanian sculpture: a relief depicting the investiture of Ardashīr II (379–83); those of the "little" cave or liwan of Shāpur III (383–88), representing this ruler and Shāpur II and having inscriptions; and those of the "large" cave or liwan of Fīrūz II (457–83) or Khusrau II (590–628). The entrance of this last monument bears a tree-of-life relief with acanthus leaves and two winged victories with triumphal crowns; in the middle is a crescent moon. The interior end wall has two scenes; a royal investiture above and Khusrau II on horseback below. The side walls bear hunting scenes. Outside the cave are found a torso of Khusrau II and two decorated capitals.

Zawiyeh (Ziviya). At this site, about 25 miles east of Saqqiz, was found a very famous treasure of gold, silver, and ivory objects, the dating of which is still the subject of controversy; attributions vary from the 9th to the 7th century B.C. Also much discussed is whether the objects belong to one or several groups. See PLS. 124, 125; II, PL. 4; VI, PLS. 248, 249.

BIBLIOG. R. Ghirshman, Notes iraniennes, IV: Le trésor de Sakkiz, les origines de l'art mède et les bronzes du Luristan, AAs, XIII, 1950, pp. 181–206; A. Luristan. This region is especially rich in archaeological remains of the pre-Islamic period. The Masjid-i-Jāmiʿ of Burujird, which dates from the Seljuk period, is the only Islamic monument worthy of mention. The plateau of Alishtar, the valleys of Badavar, Hulaylan, and Kuh-i-Dasht, the plain of Mahi Dasht, the Rumishgan and Saymarra valleys, and the plain of Asadabad have been explored and have everywhere yielded pottery of the Tepe Giyan type (see CERAMICS; ASIATIC PROTOHISTORY; IRANIAN PRE-SASSANIAN ART CULTURES). There are numerous Sassanian ruins: Dār-i-Shahr, Harsin, Qalʿa-i-Hazār Dār, Sirvan, and, in particular, remains of bridges (Pul-i-Āb Burda, Pul-i-Dukhtar, Pul-i-Khusrau, and Pul-i-Safala).

Nihavand (Nehavend). An important site for pottery in an archaeologically rich zone, this city probably occupies the site of the ancient Laodicea. A Parthian treasure, a Seleucid stele of Antiochus III (223–187 B.C.), and bronze statuettes have been found.

BIBLIOG. E. E. Herzfeld, The Hoard of the Kāren Pahlavs, BM, LII, 1928, pp. 21–27; L. Robert, Inscription hellénistique de Néhavend (Iran), Hellenica, VII, 1949, pp. 5–26.

Surkh-i-Dum. This hill rises in the plain of Kuh-i-Dasht. In an Assyrian sanctuary (883–612 B.C.) have been found various objects, including many decorated pins of the Luristan bronze type, but belonging to a sedentary rather than a nomadic population.

BIBLIOG. R. Dussaud, Anciens bronzes du Luristan et cultes iraniens, Syria, XXVI, 1949, pp. 196–229.

Tepe Giyan. Located about 5 miles southwest of Nihavand in the valley of Khava, Tepe Giyan is an independent ceramic center of great importance. Five levels of separate cultures have been distinguished, from Tepe Giyan V, of which the finds represent a link between Tepe Sialk III and the ceramic centers of southern Iran, to Tepe Giyan I, with three distinct levels connected with the Mesopotamian centers and with Tepe Sialk Necropolis A and B. (See II, PL. 9.) About 5 miles to the south, the 19 tombs of Tepe Jamshidi have furnished further important archaeological material closely related to that of Tepe Giyan.

BIBLIOG. G. Contenau and R. Ghirshman, Fouilles de Tépé-Giyan près de Néhavend, 1931–1932, Paris, 1935.

Khuzistan. Badr-Nishanda. This site is about 10 miles northeast of Masjid-i-Sulaymān. Here are ruins of an artificial terrace and remnants of columns which supported a liwan. A Parthian head was found in this locality.

BIBLIOG. A. Godard, Badr Neshandè, Āthār-e Īrān, IV, 1949, pp. 153–62.

Chuga Zanbil. At this site, about 30 miles southeast of Susa, there arose in the mid-13th century B.C. the Elamite city of Dur-Untash (destroyed in 640 by Ashurbanipal). It was enclosed by double walls, which had in their midst a ziggurat of five stories with a cult sanctuary built on the top (original ht., ca. 175 ft.). Three stories of the ziggurat remain, with a present height of about 80 ft. In the sacred area three temples have been excavated; in one of them important finds of arms and various stone objects, marbles, and bronzes have been made. Recently a tablet furnishing important information about the construction of the ziggurat was found.

Dizful. This city is about 90 miles north of Ahvaz. The bridge or Pul-i-Shāpur, constructed after A.D. 260 with the labor of Roman prisoners, is about 1,310 ft. in length and has 22 arches. It was later rebuilt on Sassanian piers.

BIBLIOG. M. Dieulafoy, L'art antique de la Perse, V: Monuments parthes et sasanides, Paris, 1889, pp. 105–09.

Jundi Shapur. Situated near Shahabad, about 5 miles south of Dizful, this is the ruin of a Sassanian city encampment for Roman prisoners; it was built on the Roman rectangular plan.

BIBLIOG. L. Vanden Berghe, Archéologie de l'Iran ancien, Leiden, 1959, p. 66.

Ivan-i-Kharkha. This site is in the region of Shushtar on the Kharkha River. The ancient Sassanian city-fortress founded by Shāpur II as a powerful walled fortification preserves remains of the imperial palace: two corridors about 100 ft. long, a large hall, and a pavilion with a triple liwan and walls which once bore frescoes.

BIBLIOG. R. Ghirshman, Cinq campagnes de fouilles à Suse, 1946–51, Paris, 1952, pp. 10–12.

Iza (anc. Malamir). Located about 95 miles northeast of Ahvaz in a plain rich with rock reliefs, the city lay on the ancient Susa-Malamir–Isfahan caravan route (now abandoned), along which are various monuments. Near Iza a ceramic group of the type of Tepe Musyan and Tell-i-Bakun was discovered. Cuneiform tablets of the 2d millennium B.C. with Akkadian texts also have been found. The principal reliefs are in Qalʿa-i-Tul at nearby Qul-i-Fara, the most interesting archaeological site in the area; there are five Neo-Elamite reliefs: an offering from King Hauni, of the time of Shutruk Nakhunte II (717–699 B.C.), with an inscription, as well as four others, less well preserved, with scenes of adoration, procession, and sacrifice. Other important reliefs in the area are to be found at Shikaft-i-Salman (four religious scenes), at Shahsavar (bas-relief consisting of two scenes), and at Hang-i-Nauruzi (a relief of the Sassanian period).

BIBLIOG. A. Layard, A Description of the Province of Khuzistan, J. Royal Geog. Soc., XVI, 1846, pp. 1–105; G. Jéquier, Description du site de Malamir, Mém. de la délégation en Perse, III, 1901, pp. 133–43.

Masjid-i-Sulaymān. Located about 30 miles southeast of Shushtar, this site has remains of various man-made terraces built against the mountain and all accessible by staircases; the main stairs lead to a platform with the remains of a triple liwan. There is a fire temple, or fortified terrace with a castle; if it is the latter, a prototype of the buildings at Pasargadae and Persepolis can be recognized.

BIBLIOG. J. M. Unvala, Ancient Sites in Susiana, Rev. d'assyriologie, XXV, 1928, pp. 83–88; A. Godard, Les monuments du feu, Āthār-e Īrān, III, 1938, pp. 7–80 at 49; M. Ghirshman, Masdjid-i Solaiman: Résidence des premiers Achéménides, Syria, XXVII, 1950, pp. 205–20.

Shami. Shami lies about 30 miles north of Iza. It has the foundations of a temple, remains of walls, and tombs of the Parthian period. Here were found the famous statues and bronze and marble objects (3d–1st cent. B.C.; PL. 141).

BIBLIOG. A. Godard, Les statues parthes de Shamī, Āthār-e Īrān, II, 1937, pp. 285–305; C. Picard, Courrier de l'art antique, GBA, XXI, 1939, pp. 201–34 at 229; H. Contenau, Statues élamites de l'époque parthe, in L'âme de l'Iran (ed. R. Grousset et al.), Paris, 1954, pp. 49–66.

Shushtar. This site is about 80 miles north of Ahvaz. It has three Sassanian bridges on the Karun which also function as dams: the very famous Bridge of Shushtar, about 1,800 ft. long, of which 28 arches remain on one side and seven on the other, the Band-i-Gurgar, and the Band-i-Miyān, several times restored. The Islamic period is represented by the Imāmzāda ʿAbd-Allāh of the Ilkhan period, which contains two rooms with domes, dating from 123[illegible]

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

and perhaps 1270 respectively. The Masjid-i-Jāmi' also is of interest, with its prayer hall formed of aisles delimited by imposing piers.

BIBLIOG. 'Abdallāh al-Shūshtarī, Tadhkira-i Shūshtar (The Book of Shushtar), 2 vols., Calcutta, 1914–24.

Susa (mod. Shush). The ancient Susa is perhaps the most interesting archaeological center of all Iran for the pre-Islamic period, especially for Elamite and Achaemenian times. The ruins are distributed over four hills: the acropolis (ht., ca. 100 ft.), which was the Elamite city and which also contains the Arab, Sassanian, Parthian, Seleucid, Achaemenian, Neo-Elamite, and proto-Elamite levels; the "Tell of the Apadana," an Achaemenian site near the remains of the Palace of Darius I; the "Tell of the Royal City," containing the residential quarters of the court and officials; the "Tell of the Artisan City." Susa represents the point of contact of the Mesopotamian and the Iranian cultures. Among the most noteworthy results of excavation has been the finding of the ceramic style named Susa I (PL. 119; III, PL. 121; VI, PL. 88), characterized by a light ground with dark decorations comprising geometric, floral, and animal motifs, in levels V and IV of the acropolis. Level III reveals undecorated pottery of the Mesopotamian Uruk type and is related to Level IV of Tepe Sialk. From the upper level of Level III and from Level II come proto-Elamite tablets and the pottery named Susa II (3000–2200 B.C.), both polychrome and monochrome (II, PL. 2). In the same area were found many Mesopotamian objects obviously taken to Susa as trophies (e.g., stele with the Code of Hammurabi; I, PL. 512), and Elamite statues, statuettes, and reliefs. The Palace of Darius had a frieze and a large capital, now in the Louvre (PL. 127); traces of a colonnade from the palace remain. At the same location is the fire temple of Artaxerxes II (404–359 B.C.), and there have also been found trilingual documents of Darius I as well as Seleucid and Parthian limestone sculptures. In the "Royal City" were excavated five levels: two Islamic levels with interesting proto-Islamic pottery; one intermediate level; the Sassanian level, which includes pottery, the remains of an interesting building with frescoes, and a Christian object; a Parthian level in which have been found a relief with an inscription of Artabanus V, a bath decorated with mosaics, and a collection of ceramics. The "Artisan City" has three Islamic levels with remains revealing the plan of a mosque of Arab type which is certainly among the oldest in Iran. There are also a Parthian Seleucid necropolis (300–200 B.C.) with two kinds of tombs, a village of the 7th century B.C. with an interesting building, and a level with Elamite and Neo-Babylonian tablets. The pottery of the lower levels is related to that of Necropolis B of Tepe Sialk, while that of the upper levels is Achaemenian. In the Islamic village is the so-called "tomb of Daniel" with a beehive dome.

Tell-i-Ghazir. This site lies northwest of Ram Hurmuz. It consists of five hills, into three of which preliminary explorations have been made. Beneath a first Islamic level the principal mound contains the ruins of an Elamite fortress (2d millennium B.C.); there follows a proto-Elamite level with tablets and pottery. Another has tombs of the 1st millennium, and the third bears traces from the 2d millennium B.C.

BIBLIOG. A. Perkins, Archaeological News: The Near East, AJA, LIII, 1949, p. 54.

Tang-i-Sarvak. This valley is about 30 miles north of Bihbihan. It has four groups of reliefs from the late Parthian period, as well as inscriptions.

BIBLIOG. F. Altheim and R. Stiehl, Die Inschriften von Tangi Sarwak, Asien und Rom: Neue Urkunden aus Sassanidischer Frühzeit, Tübingen, 1952, pp. 30–34; W. B. Henning, The Monuments and Inscriptions of Tang-i Sarwak, Asia Major, N.S., II, 1952, pp. 151–78.

Tepe Musyan. This important independent pottery center is about 95 miles northwest of Susa. Most of the pottery found here is older than that of Susa I and may belong to three successive phases. Its yellow or green body has dark decorations of geometric motifs related to certain Mesopotamian forms, as well as zoomorphic motifs; the stylization is typical.

BIBLIOG. J. E. Gautier and G. Lampre, Fouilles de Moussian, Mém. de la délégation en Perse, VIII, 1905, pp. 59–148; L. Vanden Berghe, Les ateliers de la céramique peinte chalcolithique en Iran de sud-est, RA, XXXIX, 1952, pp. 1–21.

Fars and Laristan. Abarj. This site about 30 miles northwest of Persepolis contains remains of three Achaemenian complexes — two dams and a terrace.

BIBLIOG. K. Bergner, Bericht über unbekannte achaemenidische Ruinen in der Ebene von Persepolis, Archaeol. Mitt. aus Iran, VIII, 1936, pp. 1–4.

Bishapur. This site is in the vicinity of Kazarun. It was an important Sassanian center with outstanding architectural remains. Especially notable are the great underground fire temple with a rectangular central hall, corridors, and a staircase; the ruins of Palace A of Shāpur I, with a wedge-shaped central hall that contains niches adorned with painted stucco, a court with mosaics, of which some fragments remain (X, PL. 177), and great triple liwans connected with the palace and decorated with stucco and mosaics; Palace B, or the "Stone Palace," with sculptured decoration; a votive monument with two columns with Corinthian capitals and an inscription of A.D. 266. The valley to the north of the ruins contains six Sassanian bas-reliefs, three of which are dedicated to the victory of Shāpur I over Valerian (VII, PL. 254), with various scenes added at different times; the others date from the periods of Bahrām I (273–76), Bahrām II (276–93), and Shāpur II (309–79). On the rock overlooking the valley are the ruins of a fortress with three towers. About 5 miles from the reliefs is a cave whose walls had been smoothed in preparation for more reliefs; from beneath its entrance a monumental statue of Shāpur I (ht., ca. 25 ft.) has been raised.

BIBLIOG. D. T. Rice, The City of Shapur, Ars Islamica, II, 1935, pp. 174–88; G. Salles and R. Ghirshman, Bîchâpour II: Les mosaïques sasanides, Paris, 1956.

Darab. This village is about 175 miles east of Shiraz. It is the ancient Darabjird, an important Sassanian city with double circular walls whose layout is still visible. The Masjid-i-Sang is a cruciform hall carved out of the rock; although it has a mihrab, it was perhaps not originally meant to be a place of Moslem worship.

BIBLIOG. A. Stein, An Archaeological Tour in Ancient Persia, Iraq, III, 1936, pp. 194–99.

Da u Dukhtar. This site is in the Kuh-i-Unari. A double-chambered tomb, which may have served as a royal tomb (ca. 640–560 B.C.), is cut into the rock face at a height of about 655 ft.; its façade is flanked by two proto-Ionic semicolumns.

BIBLIOG. A. Stein, Old Routes of Western Iran, London, 1940, pp. 45–47.

Firuzabad. This was an important Sassanian center. The city, founded by Ardashīr I (ca. 226–41) and named Gur, has a circular plan. At the center of the surrounding double walls are the remains of a tower with a spiral staircase; nearby is a Chahār Ṭāq. Outside the city is the Atashgāh, actually the palace of Ardashīr I, with a great liwan, a square, domed hall, and two similar side halls. On a rock face by the Tang-i-Ab River is the fortress and residence of Ardashīr, today called the Qal'a-i-Dukhtar, with a domed hall. Next to the rock is a bridge with a Pahlavi inscription. On the other shore of the Tang-i-Ab, about a mile apart, are two Sassanian reliefs depicting the investiture of Ardashīr I and the victory of Ardashīr I over Artabanus V, represented as a duel between two knights. The latter relief, about 65 ft. long, is the earliest and largest known from the Sassanian period. On the same shore of the river, stairs are cut into the rock.

Iraqi type (latter half of 14th cent.). The most interesting remains, however, are those of some sixty tombs cut into the rock, some with crosses and Syrian inscriptions; they have façades with niches and pilasters, vestibules with loculi for the dead, and principal burials. In one of these tombs is a relief with a semirecumbent figure of the Palmyra type.

Bibliog. E. E. Herzfeld, Damascus, Studies in Architecture, I: Imāmzāde Mīr Muhammad, Ars Islamica, IX, 1942, pp. 30–31; R. Ghirshman, L'île de Kharg (Ikaros) dans le Golf Persique, RA, L, 1959, pp. 77–79.

Ij (mod. Irij). This village is about 10 miles south of Niriz. Here is a "mosque" carved in the rock, with a hall covered by an elliptical vault; it was constructed before 1332–33, the date given in its inscription.

Bibliog. D. N. Wilber, The Architecture of Islamic Iran: The Il-Khānid Period, Princeton, 1955, p. 180.

Istakhr. Istakhr lies on the Persepolis–Pasargadae road about 3 miles north of Persepolis. The ruins, today called the Takht-i-Ṭā'ūs, are the ancient religious center of Fars, where the Sassanian kings were crowned. It remained an important urban center in the first years after the Islamic conquest until the flowering of Shiraz. The ruins consist of some Achaemenian or Seleucid sanctuary columns and piers later utilized in the construction of a mosque; the capitals are Corinthian. Sassanian coins and ceramics were found in the vicinity.

Bibliog. M. Streck, E. of Islam, s.v. Iṣṭakhr, II, 1921, pp. 556–60.

Kariyan. At this site south of Jahrum (Laristan) are the ruins of one of the three major ancient fire temples of Iran, the Athur Farnbag.

Bibliog. L. Vanden Berghe, Archéologie de l'Iran ancien, Leiden, 1959, p. 19.

Kuh-i-Rahmat. This is the mountain at the foot of which lies Persepolis. The two rock-carved tombs, with cruciform façades, of Artaxerxes II (404–359 B.C.; PL. 133) and Artaxerxes III (359–338 B.C.) overlook Persepolis. They house, respectively, two and three burials; their reliefs depict the kings worshiping Ahura Mazda. On the same mountain, facing Maqsudabad, are two Pahlavi inscriptions. Ossuaries are also found.

Bibliog. E. E. Herzfeld, Rapport sur l'état actuel des ruines de Persépolis et propositions pour leur conservation, Archaeol. Mitt. aus Iran, I, 1929, pp. 17–38; L. Vanden Berghe, Monuments récemment découverts en Iran méridional, Bib. O., X, 1953, pp. 5–8.

Naqsh-i-Bahrām. At this site northeast of Bishapur is a Sassanian relief of Bahrām II (A.D. 276–93); a contemporaneous one is in nearby Guyum.

Bibliog. L. Vanden Berghe, Archéologie de l'ancien Iran, Leiden, 1959, p. 56.

Naqsh-i-Rustam. This site is near Persepolis at the foot of the Kuh-i-Ḥusayn. Here are the four Achaemenian rock-carved tombs (PL. 136; IV, PL. 457) of Darius I (521–485 B.C.), Xerxes I (485–465 B.C.), Artaxerxes I (465–424 B.C.), and Darius II (424–405 B.C.); a door is flanked by four columns with ram-protoma capitals and is surmounted by bas-reliefs representing the king's throne supported by the conquered nations. At the foot of the tombs are eight Sassanian reliefs: the investiture of Ardashīr I (224–41); the investiture of Bahrām II (276–93), carved over an Elamite relief of which traces remain; another of Bahrām II; Shāpur II (309–79); Ormizd II (302–09); the victory of Shāpur I (241–72) over Valerian; Bahrām II again; the investiture of Narsah (293–302). To the left of the complex, in the open, are twin fire altars of the Sassanian period. In front of the complex is the Ka'ba-i-Zardusht, with a staircase and blind windows, of uncertain function (perhaps a funerary monument or a fire sanctuary; PL. 137); it bears a Greco-Pahlavi inscription of Shāpur I. Trial excavations have brought Sassanian and Islamic objects to light. The Sassanian reliefs of Naqsh-i-Rajab are not far away.

Bibliog. M. Dieulafoy, L'art antique de la Perse, I, Paris, 1884, pp. 1–71; F. Sarre and E. E. Herzfeld, Iranische Felsreliefs, Berlin, 1910, pp. 3–91; R. Byron, An Early Rock Carving at Naqshi Rustam, B. Am. Inst. for Persian Art and Archaeol., IV, 1935, p. 39; E. F. Schmidt, The Treasury of Persepolis and Other Discoveries, Chicago, 1939, p. 105; K. Erdmann, Die Altare von Naqshi Rustam, Mitt. der d. Orientgesellschaft, LXXXI, 1949, pp. 6–15; W. B. Henning, Pahlavi Inscriptions (Corpus inscriptionum iranicarum, III), II: Private Inscriptions of the Classical Period, 2, London, 1957, pls. 25–48.

Niriz. The Masjid-i-Jāmi', a mosque with a single liwan, is found at this site; despite reconstruction and many additions, the earliest sections date from the mid-10th century. The liwan, with niches on the sides, is the earliest extant example of a liwan of the Iranian mosque type that goes back to a pre-Seljuk period; in the Seljuk period this type became current in Iran and replaced the Arab type.

Bibliog. A. Godard, Le Masdjid-é Djumè de Niriz, Āthār-e Irān, I, 1936, pp. 163–72.

Nurabad. This site lies about 25 miles north of Bishapur, on the road to Fahlian. About 5 miles to the west is the square tower called Mīl-i-Azdahā, similar in construction to that of Ka'ba-i-Zardusht and to the Zindān-i-Sulaymān of Pasargadae. In the vicinity is a fire temple of the Seleucid or Parthian period.

Bibliog. R. Ghirshman, La tour de Nurabad, Syria, XXIV, 1944, pp. 175–93.

Pasargadae. This was the Achaemenian capital, founded by Cyrus II between 559 and 550 B.C. It was the residence of his successor Cambyses II (529–521 B.C.). Here is the famous tomb of Cyrus, known as the Mashhad-i-Madar-i-Sulaymān (PL. 126). It is a rectangular, house-shaped block with a double pitched roof on a high podium of six steps. Around it lie an Islamic cemetery and the remains of a mosque constructed with Achaemenian material in the 13th century. The Pasargadae complex also includes the Apadana (Audience Hall) of Cyrus, with a large rectangular central hall with two rows of columns (one column still stands); here were found fragments of reliefs. Another palace, nearer the Pulvar River, also has a rectangular central hall and portico, as well as a bas-relief with a winged genius (PL. 127). The royal residence has a large hall and vestibule and a trilingual inscription. The structure called the Zindān-i-Sulaymān was probably a fire temple rather than a funerary tower; fragments of its four walls remain. The site also includes the ruins of a fortified terrace and two fire altars with steps.

Bibliog. E. E. Herzfeld, Pasargadae: Untersuchungen zur persischen Archäologie, Berlin, 1908; E. E. Herzfeld, Bericht über die Ausgrabungen von Pasargadae, Archaeol. Persepolis (Parsa, now Takht-i-Jamshid). This famous complex was the Achaemenid imperial residence, which Darius I founded about 518 B.C. Along with Ṭāq-i-Bustān, Sarvistan, Firuzabad, and Kuh-i-Khwaja, it is one of the rare sites of pre-Islamic Iran of interest for more than purely archaeological reasons. Mention will be made only of the principal buildings on the Terrace built by Darius I on a spur of the Kuh-i-Rahmat (PL. 131). The Terrace, about 1,475 ft. wide by 985 ft., and about 25 to 60 ft. high, was surrounded by a fortified wall, on the south side of which is a cuneiform inscription. At the northwestern corner of the complex (see FIG. 229) is a monumental stairway of 106 steps, about 23 ft. wide, leading to the Gatehouse of Xerxes, a square hall with four columns, two of which still stand, and three doorways about 36 ft. in height to the west, east, and south. Four bulls flank the west doorway; two winged, human-headed bulls the east doorway. The east doorway opens onto an avenue which leads to the propylaea of the Throne Hall of Xerxes or "Hundred Column Hall." The south doorway of the gatehouse opens onto a court with a pool, from which one gains access to the Apadana of Darius and Xerxes, the imperial Audience Hall (PL. 131; I, PL. 404). This building is a great square hall, about 250 ft. on a side, with 36 columns (only 3 are still standing), flanked by porticoes which are also provided with columns (10 remain) to the north, west, and east, and with two stairways to the north and east, decorated with the famous reliefs depicting the homage paid to the ruler by the peoples of his empire. At the southeast corner of the Apadana is the Tripylon, or Council Hall, which has an entrance stairway adorned with reliefs (PL. 132), three great decorated doorways (PL. 135), and a square hall with four columns; to the west of the Tripylon is a poorly preserved section known as the "problematic structure"; further west is the Tachara, or Palace, of Darius, which has a hall with decorated doorways, a portico, and a number of small rooms. South of these three units is the Hadish, or Palace, of Xerxes, similar in plan to the preceding building, with a balcony overlooking the plain. A stairway leads to the "Harem" — composed of various apartments of hypostyle construction with decorated doorways and a vestibule — which, together with the rectangular Treasury, with various hypostyle halls, and a bas-relief showing the homage paid to Darius (PL. 133), occupies the entire southern side of the Terrace. The northeast corner of the

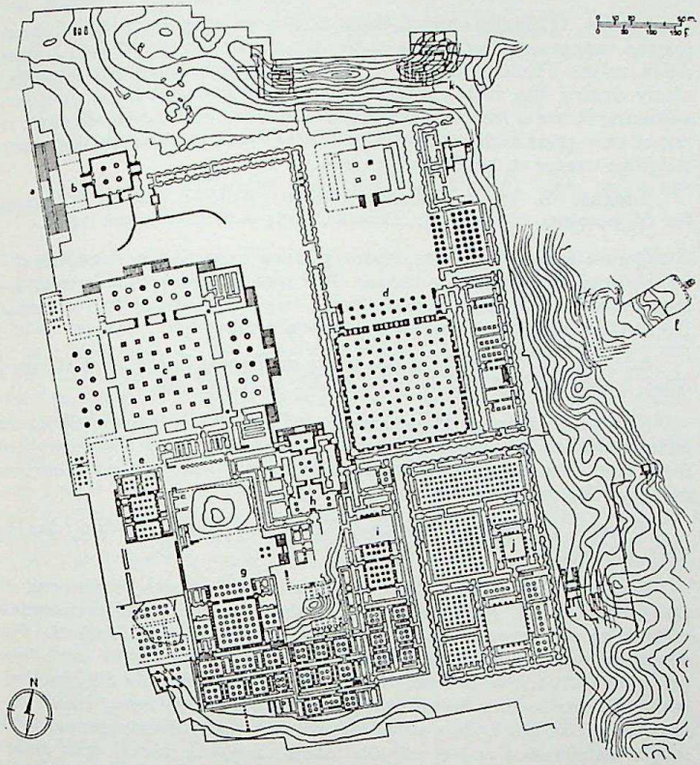
UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

terrace is devoted chiefly to the previously mentioned Throne Hall of Xerxes, or "Hundred Column Hall" (which suffered greatly in Alexander's fire), with its propylaea, court, vestibule, and rich decoration (PL. 134); only the bases of the columns remain. East of the court is a hypostyle hall with portico, and south of the hall are various rooms and magazines. Outside the terrace, to the south, is the unfinished tomb of Darius III (336–331 B.C.). Very little remains of the city at the foot of the royal residence; to the northwest there is a window with bas-relief and, nearby, column bases, perhaps the remains of a Seleucid



Plan of Persepolis: (*a*) the great entrance stairway; (*b*) Gatehouse of Xerxes; (*c*) Apadana, or Audience Hall, of Darius and Xerxes; (*d*) Throne Hall of Xerxes, or "Hundred Column Hall"; (*e*) Tachara, or Palace, of Darius; (*f*) palace, probably rebuilt by Artaxerxes III; (*g*) Hadish, or Palace, of Xerxes; (*h*) Tripylon, or Council Hall; (*i*) restored area of the "Harem"; (*j*) Treasury; (*k*) section of northern fortifications; (*l*) royal tomb, probably of Artaxerxes II.

temple; to the northeast is a decorated portal, and to the south, column bases, a pool, and the remains of a palace with hall, vestibule, and trilingual inscription of Xerxes I. (See also above, Kuh-i-Rahmat.)

Qaṣr-i-Abū-Naṣr. This site is located about 5 miles southeast of Shiraz. Here are the remains of an isolated Achaemenian portico which probably was brought from Persepolis, as well as ruins of a Sassanian fortress with traces of an earlier Parthian occupation. Bronze objects, pottery, and seals also were found.

BIBLIOG. W. Hauser and J. M. Upton, The Persian Expedition at Kasri Abu Nasr, BMMA, XXVIII, 1933, sup., pp. 39–44, XXIX, 1934, sup., pp. 3–22; M. S. Sarvistan. This village is about 55 miles east of Shiraz. Here are the ruins of the Imāmzāda Shaykh Yūsuf Sarvistānī. There remain massive piers and arches dating from the late 13th century as well as slightly later additions and tombs. About 5 miles from the village is the well-preserved Sassanian palace of Bahrām V (420–40), consisting of a liwan, a square, domed hall, a courtyard, and various domed rooms surrounding the hall.

Shiraz. This is the most important city of Fars and one of the most famous Persian cities. The home of Ḥāfiẓ and Saʿdī and a place of literary pilgrimage, it does not possess much of artistic interest except its famous gardens. The city suffered greatly from the Afghan invasion in the third decade of the 18th century, and its most important buildings date from after this period. Many were built under the Zand chief Karīm Khan, who made Shiraz his capital in the mid-18th century. Of the early period there remains the Masjid-i-Jāmiʿ, built in 875 by the Saffarid ʿAmr ibn-Layth. It is one of the most ancient mosques in Iran, but later restoration has made the original elements nearly unrecognizable. In the courtyard of the mosque is the library, or Khodāy Khāna, of Abū-Isḥāq (1351). It, too, is very much restored; it is constructed on a square plan with bastions at the four corners and a covered, columned circumambulatory passage around the exterior. The Masjid-i-Nau is originally of the 12th century but has been rebuilt. The so-called "tomb of Abash Khatun" is of the 14th century, while the Madrasah-i-Khān and the Mausoleum of Bībī Dukhtarān date from the Safavid period. From Karīm Khan's time are the citadel, the bazaar, the bath, the cisterns, the "Gate of the Koran" (recently rebuilt), the mausoleums of Ḥāfiẓ and Saʿdī (also rebuilt), the pavilion in the Bāgh-i-Naẓar (now housing the small Museum of Fars, founded in 1938), and, above all, the Masjid-i-Vakīl, with a richly decorated prayer hall with aisles. The Imāmzāda Shāh Chirāgh has religious but no architectural significance. The main beauty of Shiraz lies in the villas in the city and surroundings. These are among the best examples of Persian secular architecture of the period just before Europeanization, although presently the pride of the inhabitants is the modern hospital, the construction of which marked a high point in the renovation of the city. Although it does not differ greatly from the typical modern Iranian city based on a grid formed by great avenues, in general appearance Shiraz is among the most harmonious cities in the country. The Khiyābān-i-Zand, the main boulevard of the city, is pleasantly lined with various kinds of trees and is the widest major street in any Iranian city.

Arberry, Shiraz: Persian City of Saints and Poets, Norman, Okla., 1960; A. Hatami, Shiraz, Teheran, 1961.

Sih-Talu. This site lies northwest of Fahlian on the Shiraz–Ahvaz road. The Elamite rock reliefs of Kurangun (late 3d millennium) are almost inaccessible; they show scenes of adoration and procession.

BIBLIOG. E. E. Herzfeld, Archaeological History of Iran, London, 1935, pp. 4–5; N. C. Debevoise, The Rock Reliefs of Ancient Iran, JNES, I, 1942, pp. 78–80.

Tell-i-Bakun. This site lies in the plain of Marv Dasht and comprises two hills, known as A and B, southwest of the terrace of Persepolis. In more than twenty tepes (mounds) were found neolithic pottery and other ceramics in a style characteristic of the region of Fars. This style is contemporaneous with that of Susa I (first half of 4th millennium).

BIBLIOG. A. Langsdorff and D. E. McCown, Tall-i Bakun A: Season of 1932, Chicago, 1942.

Tell-i-Shugha. At this site in the area between Pasargadae and Persepolis were found ceramics of a type exclusive to this region, characterized by a red body and dark decoration of animal and plant motifs in a somewhat naturalistic style.

BIBLIOG. L. Vanden Berghe, Archéologie de l'Iran ancien, Leiden, 1959, pp. 42–44.

Tang-i-Chak Chak. At this site in the region between Rustaq and Furg (Laristan) are two Sassanian fire temples in an excellent state of preservation.

Tulaspid. This site is located about 5 miles west of Fahlian. Some Elamite ruins (1550–1000 B.C.) are preserved here.

Bibliog. E. E. Herzfeld, Reisebericht, ZMG, LXXX, 1926, pp. 225–84.

Kerman, Baluchistan, and Seistan. This region includes such archaeological sites as Bampur, Damin, Dih-i-Urazi, Khurab, Maula, Pīr-i-Kunār, Shahr Daraz, and Tell-i-Iblis. These have yielded painted and incised ceramics which prove that relations existed between such centers as Susa, Tepe Musyan, and Tell-i-Bakun and the cultures of Pakistani Baluchistan. On these, see A. Stein. *Archaeological Reconnaissances in Northwest India and Southeast Iran*, London, 1937; on the neolithic sites — Katukan, Machi, Qal'at-i-Gird, Ramrud, and Shahr-i-Sukhta — F. H. Andrews, "Painted Neolithic Pottery in Sistan, Discovered by Sir Aurel Stein," *BM*, XLVIII, 1925, pp. 304–08; for the interesting bronzes found at Khinaman, see C. Greenwell, "Notes on a Collection of Bronze Weapons, Implements and Vessels found at Khinaman," *JRAS*, XXXVIII, 1907, pp. 196–200. From Jiruft come objects of the Parthian period; there are Sassanian remains at Karku and at Ram Shahristan, the ancient capital of Seistan; see E. E. Herzfeld, "Reisebericht," *ZMG*, V, LXXX, 1926 ff., and in general, A. I. Millar, *Ocherk Seistana: karavannye puti; Otchot o Komandirovke v Kerman* (*Essay on Sistan: Caravan Routes; Report on a Mission to Kirman*), *Sbornik Materialov pro Aziyu*, LXXVII, 1904; G. P. Tate, *Seistan: A Memoir on the History, Topography, Ruins and People of the Country* (*Parts 1–4*), Calcutta, 1910–12.

Bam. This town is about 120 miles east of Kerman. It is known for its old mosques and especially for its citadel. Of the mosques — the Masjid-i-Rasūl, one of the most important in Iran, and the Masjid-i-Arg — there remain only a few traces. The citadel is the most complete and best-preserved example of a Persian fortified city in existence. It is built entirely of unbaked brick and occupies an area of about 2 sq. miles northeast of the modern city. Imposing bastions with a single monumental gate surround it; within it are still a few well-preserved buildings. The antiquity of its origins is certain, but its uninterrupted use as a fortress over so many centuries made restorations frequent and repeated. Because Persian military architecture changed little, the repairs are not obvious; therefore it is still impossible to give it a precise date.

Bibliog. B. Pārīzī, Rāhnumā-i āthār-i tārīkhī-i Kirmān (Guide to the Monuments of Kirmān), Teheran, 1335 A.H. (1956), pp. 26–43.

Chahbar. This is a small port on the Persian Gulf (Makran). Here are the ruins of a Portuguese colonial fortress of the 16th century. Traces of the Portuguese occupation are more evident in this lesser site than at Rishahr (Fars) or at the principal Portuguese center, Hurmuz.

Bibliog. S. Mockler, On Ruins in Makran, JRAS, IX, 1877, pp. 121–34; T. H. Holdich, Notes on Ancient and Medieval Makran, Geog. J., VII, 1896, pp. 387–405; P. Schwarz, Hurmuz, ZMG, LXVIII, 1914, pp. 531–43.

Kerman (Kirman). This important city is the capital of the region of the same name. Although of importance throughout much of Persian history, it has been in decline since the coming of the Qajar dynasty (see QAJAR SCHOOL). Among noteworthy monuments are the Qal'a-i-Dukhtar, an ancient citadel on the hill dominating the city; the Gunbad-i-Jabaliya, a domed central-plan building with an octagonal exterior, of uncertain date (perhaps 13th cent.); the Masjid-i-Malik of Seljuk origin, ruined through rebuilding and neglect; the Seljuk Mausoleum of Khwāja Atabek; the Masjid-i-Jāmi', a typical mosque with four liwans, decorated with kashi, and bearing an inscription with the date 1349; the Masjid-i-Pā-Minār (1390); the complex (in ruins but with interesting decorative elements) of the square, caravanserai, and bath of Ganj 'Alī Khan, a governor of the Safavid period, who was also responsible for the very beautiful garden in Bayramabad; the Madrasah of Ibrāhīm Khan, a theological center of the dissident Shiite sect (19th cent.). The vaults of the bazaar preserve some examples of early painted decoration. The *gunbad* and the Masjid-i-Jāmi' have been studied most thoroughly.

Pārīzī, Rāhnumā-i āthār-i tārīkhī-i Kirmān (Guide to the Monuments of Kirman), Teheran, 1335 A.H. (1956).

Kuh-i-Kwaja. On this solitary mountain rising as an island in Lake Hamun is one of the most interesting complexes of ruins of ancient Iran. At first thought to be a Buddhist temple, it now is known to have been the residence of a Parthian governor. Two phases of construction can be distinguished inside. A monumental fire temple hall adjoins the palace. Stuccoes and frescoes were found, and although the latter have now almost disappeared, they are of great interest.

Mitt. aus Iran, IV, 1932, pp. 1–116; F. H. Andrews, Catalogue of Wall Paintings from Ancient Shrines in Central Asia and Sīstān, Delhi, 1933; H. Ṣamadī, Sīstān az anzar-i bāstānshināsī (Sistan in the Light of Archaeology), Gudhārishhā-i bāstānshināsī, III, 1955–56, pp. 147–68.

Mahan. This site located about 25 miles east of Kerman is famous for the monumental complex of the sanctuary of Nūr ad-Dīn Ni'mat Allāh, of the Timurid period. This was restored several times, particularly during the 18th century; thus it now includes Qajar minarets; adjoining it are a museum and library. In its present condition it is not of very great architectural significance, but it is the most important religious center in southeastern Iran.

Bibliog. B. Pārīzī, Rāhnumā-i āthār-i tārīkhī-i Kirmān (Guide to the Monuments of Kirmān), Teheran, 1335 A.H. (1956), pp. 74–95.

Qal'a-i-Sang. This site, about 5 miles from Sirjan, is on the site of the ancient city of this name. The remains include a fortress destroyed by Tīmūr Lenk (Tamerlane), traces of walls and of a citadel, Roman baths, and inscriptions of 1019 and 1387.

Bibliog. G. Le Strange, The Cities of Kirman in the Time of Hamd Allad Mustafawī and Marco Polo, JRAS, 1901, pp. 281–90.

Khorasan (Khurasan). Ahangan. This site is located about 10 miles north of Mashhad. Here is a domed funerary tower, perhaps from the Timurid period, with an octagonal interior and a circular exterior decorated with semi-columns.

Bibliog. A. Godard, Khorasan: Le mīl-é Ahangan, Āthār-e Īrān, IV, 1949, pp. 137–42.

Bistam. This village, located about 5 miles north of Shahrud on the Gurgan road, possesses some of the most beautiful architecture of Iran in the sanctuary of the famous mystic Bāyazīd Bisṭāmī. The structure was begun immediately after the death of the saint (late 9th cent.). It includes traces of pre-Seljuk buildings, a Seljuk minaret, and remains of a Seljuk mosque, all dating from 1120. Ilkhan elements predominate, however, comprising the mosque proper with stucco decorations and a mihrab dated 1299, the portal with stucco stalactites, the entrance corridor with a frieze containing the name of Öljeitü (Uljeitu), dated 1313, and the liwan on the court decorated, like the portal, with faïence. The Masjid-i-Jāmi', with a prayer hall on the eastern side of the court separated by arches, has the typical stucco decoration and a mihrab of the early 14th century. An Ilkhan tomb tower of the Varamin type stands near the Masjid-i-Jāmi' (ca. 1300).

Bibliog. O. Benderev, Astarabad-Bastamskii raion Persii (The Astarābād-Bisṭām Region of Persia), Tashkent, 1904; De Qasr-i Shīrīn à Meshhad et Tus, Teheran, 1934, pp. 42–43; I. Yaghmānī, Bisṭām va Bāyazīd-i Bisṭāmī (Bisṭām and Bāyazīd Bisṭāmī), Teheran, 1317 A.H. (1938); D. N. Wilber, The Architecture of Islamic Iran: The Il-Khānid Period, Princeton, 1955, pp. 127–28.

Damghan. This town about 280 miles east of Teheran is known for having the oldest existing mosque in Iran (8th cent.). It is of the Arab type, and its prayer hall has aisles divided by massive columns (Tārīkh Khāna). In the vicinity is a minaret of the Seljuk period (1026–30). The Masjid-i-Jāmi', which has been restored, has a Seljuk minaret (1106–07). The two Seljuk circular tomb towers of Pīr-i-'Ālamdār and Chihīl Dukhtarān date, respectively, from 1026–27 and 1054–55. Nearby is the portal of a mosque, perhaps of 1315. The Imāmzāda Ja'far, of Seljuk origin with additions from the 15th century, contains decorative elements taken from another building in the vicinity.

Bibliog. A. Godard, Le Tari Khane de Damghan, GBA, XII, 1934, pp. 225–35; I. Yaghmānī, Jughrāfyā-i Tārīkhī-i Dāmghān (Historical Geography of Dāmghān), Teheran, 1326 A.H. (1947).

Farumad. This village is about 5 miles from the Shahrud–Sabzavar road, northeast of 'Abbasabad. Ruins of the Masjid-i-Jāmi', with two liwans, are found here; the building is perhaps of Seljuk origin (13th cent.) but it was completed in the Ilkhan period (ca. 1320).

Bibliog. A. Godard, Khorasan: Les mosquées de Forūmad et de Zawzan, Āthār-e Īrān, IV, 1949, pp. 83–112.

Kharjird. This site is in the neighborhood of Khaf. The Nizāmiya, a ruined madrasah of the Seljuk period (latter half of 11th cent.), probably had a square court with four liwans; it is the earliest extant

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

example of a building form destined to have great success in Iranian architecture. The madrasah of the Timurid period (1444) was probably built by the same architect as that at Tayabad.

Bibliog. A. Godard, Khorasan: La Niẓāmīyyè de Khargird, Āthār-e Īrān, IV, 1949, pp. 68–83.

Kal-i-Jangal. At this site southwest of Birjand were found graffiti showing a man with a lion and the profile of a bearded figure; they may date from the beginning of the Sassanian period, in spite of the inscriptions in Arsacid Pahlavi.

Bibliog. J. Rizhā'i and S. Kiyā, Gudhārish-i nivishtahā va paikarhā-i Kāl-i Jangal (Report on the Inscriptions and Symbols of Kāl-i Jangal), Irankuda, XIV, 1320 A.H. (1941–42).

Khusraujird. This site lies about 5 miles west of Sabzavar on the road to Shahrud. Here is a Seljuk minaret of 1111–12.

Bibliog. A. Godard, Khorasan, Āthār-e Īrān, IV, 1949, pp. 1–150 at 61.

Mashhad (Meshed). This is the capital of Khorasan and the most important Shiite religious center of Iran. Like Teheran, it developed at the expense of an earlier and more famous neighboring center, the present village of Sanabad near Tus, which in 809 received the tomb of the Abbasside Caliph Hārūn al-Rashīd and in 818 that of the eighth of the twelve Shiite Imams, 'Alī al-Riẓā. He had died suddenly accompanying his adoptive father, the Abbasside caliph al-Ma' mūn, on a visit to the place of Hārūn's death. Thus the suburb of Tus became a goal of Shiite pilgrimage and was given the name "Mashhad" or "Burial Place of a Martyr." (The word is first documented in the late 10th cent.) In 1389 Mashhad gave sanctuary to the survivors of the sack of Tus by Tīmūr Lenk (Tamerlane), thereby replacing the destroyed city. The period of greatest splendor of the new capital was that of the Timurid Shah Rukh, to whom the most interesting monument in the sanctuary is due. 'Abbās I did much to beautify the city and to heighten its importance as a national shrine. Nādir Shah made Mashhad his favorite residence; the Qajars also contributed new buildings. Within the sanctuary area (Ḥaram, Bast) is the shrine itself, located in the center of the city and still strictly forbidden to unbelievers. The sanctuary is made up of separate complexes of shrines, madrasahs, a bazaar, and inns which are now hotels. Centered in the enclosure is the tomb of the Imam; it bears two inscriptions dating from 1118 and 1215, although the earliest forms apparent today are those of the 14th century. The Golden Dome, restored in 1675 by Sulaymān I, goes back to the period of 'Abbās I (1607), as does the nearby domed tomb of Allāhvardī Khan, to the northeast, the most notable among all the buildings, both isolated and adjoined, in the vicinity of the Imam's tomb. The "old court" (Ṣaḥn-i-Kuhna), to the north of the Imam's tomb, has an earlier southern section dating from the latter half of the 15th century but completely restored by Nādir Shah, and a northern section which is the work of Shah 'Abbās I. To the same ruler are also due two of the four towers with liwans — the clock tower and the Naqqāra Khāna (Music Gallery) used, according to an ancient tradition, to celebrate the sunrise and sunset. The northern entrance was constructed uder Shah 'Abbās II and is flanked by a minaret of Ṭahmāsp I. The famous Golden Gate on the south, along with its minarets, is of Nādir Shah, as is the octagonal central fountain called the Saqqakhāna-i-Nādirī. The Dār al-Ḥuffāẓ and the Dār al-Siyāda, both of the first half of the 15th century, were built in the period of Shah Rukh between the "old court" and the mausoleum; they are among the most notable buildings of the complex. To the east of the Imam's tomb is the "new court" (Ṣaḥn-i-Nau), begun in imitation of the old by Fatḥ 'Alī Shah in 1818 and completed by Nāṣir al-Dīn in 1855; on this side are also two buildings between the mausoleum and the Golden Gate. To the south of the tomb is the very famous Mosque of Jauhar Shād, wife of Shah Rukh; it was completed in 1418 and has four liwans, a great dome, and kashi decoration. In the center of this so-called Masjid-i-Pīr-i-Zan is an open area surrounded by a balustrade. Among the numerous minor sanctuaries is the Qadam-i-Mubārak, where a footprint of the Imam is venerated. Among the madrasahs worthy of note are the Madrasah-i-Dudar and the Madrasah-i-Parīzād, both of the first half of the 15th century. The library of the shrine was begun by Shah Rukh. The museum, installed (1945) within the sacred area, has an outstanding collection of ceramics, rugs, and illuminated manuscripts. Outside the sacred area the principal monuments are the Masjid-i-Shāh (1451), the Madrasah-i-Mīrzā Ja'far (1650) — the most interesting of the city's many madrasahs (included within it is the contemporary madrasah of Khairāt Khan as well as nine from the time of Sulaymān I and three from the Qajar period) — and from the Safavid period the Mausoleum of Khwāja Rabī', north of the city, with rich kashi decoration, and, east of the city, the *muṣalla* with a great liwan.

Samadi, The Museum of Meshed, Teheran, 1955.

Nishapur. This important city was founded by Shāpur I (241–72). It was one of the principal centers of Khorasan in the Islamic Middle Ages, when it developed its own ceramic style. Here was built one of the most famous mosques of early Persian Islam, of which, however, nothing remains. The present Masjid-i-Jāmi' of 1493–94 has two liwans. The greatest interest presented by the area of Nishapur is archaeological: stuccoes and ceramics were found here. The mausoleums of the poets 'Aṭṭar and Omar Khayyam, in the immediate vicinity of the city, are not of great interest; more notable is the shrine of Qadamgāh of the Safavid period, not far from the city on the Mashhad road.

Bibliog. J. M. Upton and others, The Persian Expedition: Excavations at Nishapur, BMMA, XXXI, 1936, pp. 176–82, XXXII, 1937, pp. 1–38, XXXIII, 1938, pp. 1–23, XXXVII, 1942, pp. 82–119.

Qal'at-i-Nādirī. Here is the so-called "Treasure House" of Nādir Shah, a tomb tower of the type of East Radkan and Kishmar, but larger.

Bibliog. A. C. Yate, Kalat-i Nadiri, J. Royal Central Asiatic Soc., XI, 1924, pp. 156–68.

East Radkan. This site is in the vicinity of the Mashhad–Quchan road. Here is a tomb tower, said to be the Mīl-i-Rādkān, from the late 13th century. It is perhaps the oldest of this kind of building having an exterior decoration of semicolumns (of which there are 36). The exterior of the tower is twelve-sided, the interior octagonal, and the roof domed.

Bibliog. E. Diez, Churasanische Baudenkmäler, Berlin, 1918, pp. 43–46, 107–09.

Rubat Sharaf. This site lies between Mashhad and Sarakhs, about 25 miles south of the latter, on the old Nishapur–Merv road. Here is a complex of the Seljuk period, perhaps completed in 1114–15, comprising a caravanserai, a fortress, and a palace with two courts with four liwans each.

Bibliog. A. Godard, Khorasan: Rubat-Sharaf, Āthār-e Īrān, IV, 1949, pp. 7–68.

Sangbast. This village is about 20 miles south of Mashhad. It has a tomb with a dome on an octagonal base from the Ghaznevid period (see GHAZNEVID ART), probably built by the governor of Tus, Arslān Jādhib (first half of 11th cent.). Here also are a minaret and the ruins of a caravanserai.

Bibliog. A. Godard, Khorasan, Āthār-e Īrān, IV, 1949, pp. 1–150 at 10, 14; A. Godard, Voûtes iraniennes, Āthār-e Īrān, IV, 1949, pp. 187–368 at 264, 295.

Sarakhs. This site lies at the border of Soviet Turkmenistan. Here is the tomb of Sheik Muḥammad ibn-Luqmān (1356) with a double dome and a liwan portal.

Bibliog. E. Diez, Churasanische Baudenkmäler, Berlin, 1918, pp. 62–66.

Tepe Hissar. This very famous archaeological center is in the immediate vicinity of Damghan. Three prehistoric levels have been excavated: Ia, b, c; IIa, b; and IIIa, b, c, all rich in clay vessels and bronze objects. Traces of the Parthian capital Hecatompylos were sought here in vain. (On this see A. D. Mordtmann, "Hekatompylos," *Sitzungberichte der bayerischen Akademie der Wissenschaften zu München*, Historisch-philologische Klasse, I, IV, 1869, pp. 497–536.) However, there were found remains of a Sassanian palace and fire temple (of Kavādh I, 488–531) with outstanding stuccowork.

Bibliog. E. F. Schmidt, Excavations at Tepe Hissar, Damghan, Philadelphia, 1937; S. Piggott, Dating the Hissar Sequence: The Indian Evidence, Antiquity, XVII, 1943, pp. 169–82; D. H. Gordon, The Chronology of the Third Cultural Period at Tepe Hissar, Iraq, XIII, 1951, pp. 40–61.

Tayabad. This site lies on the Mashhad–Herat road at the Afghan border. The Masjid-i-Maulānā, one of the most interesting buildings of the period of Shah Rukh (1405–47), was erected in 1444 in honor

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

of some unknown person. It has splendid marble and kashi decorations and a great domed hall with a liwan, flanked by vaulted rooms also with liwans. The mosque is closely related stylistically to the monument of Turbat-i-Shaykh Jām and to the Mausoleum of ʿAbdullāh Anṣārī at Herat in nearby Afghan Khorasan.

Bibliog. M. T. Mustafawi, Le Masdjid-é Mawlānā de Tāiyābād, Āthār-e Īrān, III, 1938, pp. 179–99.

Turbat-i Shaykh Jām. At this site on the Mashhad–Herat road is the tomb complex of Shaykh Jām. The earlier parts are Ilkhan (ca. 1330), but the building of the other portions continued over a long period; the portal bears the date 1456; new work was added by Shah ʿAbbās I. The over-all aspect is primarily Timurid, and the building generally is related to the Masjid-i-Maulānā of Tayabad.

Bibliog. E. Diez, Churasanische Baudenkmäler, Berlin, 1918, pp. 78–82.

Tus. This famous ancient city of Khorasan, destroyed by Tīmūr Lenk in 1389, is today merely a humble village. Its position was taken over by Mashhad. There are remains of a Seljuk bridge, and here also is the Hārūniya, an early-14th-century mausoleum of unknown purpose with a square exterior, octagonal interior, and a great dome.

Bibliog. E. Diez, Churasanische Baudenkmäler, Berlin, 1918, pp. 55–62.

Caspian regions. Amul. This is among the most important centers of Mazanderan. Its ancient Masjid-i-Jāmiʿ has been largely rebuilt in recent times. It has a group of ancient tomb towers, among the most famous of which are the tomb of Shams-i-Ṭabarsī, with a pyramidal roof on an octagonal base, the tomb of Nāṣir al-Ḥaqq, of cubic shape with a pyramidal roof, and the Gunbad-i-Sih Tan. Mazanderan is rich in medieval tomb towers. Other characteristic tomb towers are found at Babul and Babul-Sar.

Bibliog. H. L. Rabino di Borgomale, Māzandarān and Astarābād, London, 1928, pp. 33–40.

Bihshahr. Here is the villa of Safiabad, a restored structure of Safavid origin, which is at present a royal residence. At the same site is the Imāmzāda ʿAbdullāh.

Bibliog. J. C. Hantzsche, Palaste Schah Abbas I, Mazanderan, ZMG, XV, 1862, pp. 669–80, XVIII, 1864, pp. 669–79, XX, 1866, p. 186; H. L. Rabino di Borgomale, Māzandarān and Astarābād, London, 1928, pp. 63–64.

Ghār-i-Hūtū. This cave has yielded prehistoric finds and is among the most important because it furnishes information on life in Mazanderan during the Iron, Bronze, chalcolithic, and Neolithic ages. Similar caves are the Ghār-i-Kamarband and the Ghār-i-ʿAlī Tepe, near Bihshahr.

Bibliog. C. S. Coon, Cave Excavations in Iran, Philadelphia, 1951, pp. 20–31, 37–41, 44–52, 69–76, 78–89, 93–95.

Gunbad-i-Qābūs. This is in ancient Gurgan; today it is an important center of the region. It has the most imposing tomb tower in Iran, called the Gundab-i Qābūs (1006–07).

Bibliog. E. Diez, Churasanische Baudenkmäler, I, Berlin, 1918, pp. 39–43, 100–06; H. L. Rabino di Borgomale, Māzandarān and Astarābād, London, 1928, pp. 87–88.

Gurgan. Capital of Gurgan, this is the ancient Asterabad (or Astarabad). The famous golden treasure of Asterabad found here includes some objects from the late 3d millennium, relating to Tepe Hissar Level III. About 15 miles to the north are the remains of the structure called the Ṣadd-i-Iskandar, an ancient wall erected against nomad attacks. The Islamic buildings are of little interest.

Bibliog. M. I. Rostovtsev, The Sumerian Treasure of Asterabad, JEA, VI, 1920, pp. 4–27; H. L. Rabino di Borgomale, Māzandarān and Astarābād, London, 1928, pp. 73–74; G. Contenau, Le trésor d'Asterabad et les fouilles de Tépé Hissar, Rev. d'assyriologie, XXXI, 1934, pp. 77–80.

Kalar Dasht. This site is in Mazanderan, west of the Karaj–Chalus road. Here was found an important Sassanian metal and silk treasure which includes decorated silver-gilt cups, silver bottles, and silks with scenes of lion hunts. A group of tombs of 1000–800 B.C. contains precious objects and ceramics relating to Tepe Sialk B. (See I, pl. 437; II, pl. 4; VI, pl. 249.)

Bibliog. M. Bahrami, L'Exposition d'art iranien à Paris, AAs, XI, 1948, pp. 13–23; H. Samadī, Ganjīna-i Kalār Dasht (The Treasure of Kalār Dasht), Gudhārishhā-i bāstānshināsī, III, 1956, pp. 115–16.

Lajim. This village is in the Zirab region (Savad Kuh). Its structure called the Imāmzāda ʿAbdullāh is a circular tomb tower of 1022–23. In Resget, in the same zone, is a similar tower which is probably contemporaneous.

Bibliog. A. Godard, Les tours de Ladjim et de Resget, Āthār-e Irān, I, 1936, pp. 109–21.

Sari. In this important city and capital of Mazanderan Sassanian silver was discovered, including bowls, forks, and a plate. The interesting tomb towers called the Imāmzāda Yaḥyā, the Imāmzāda Zayn al-ʿĀbidīn, and the Imāmzāda ʿAbbās have been preserved.

Bibliog. H. L. Rabino di Borgomale, Māzandarān and Astarābād, London, 1928, pp. 51–56; R. Ghirshman, Notes iraniennes, VI: Une coupe sasanide à scène de chasse, AAs, XVIII, 1955, pp. 5–19; A. Ḥakīmī, Bushqāb-i nuqra-i munḥaṣir bifard-i sāsānī makshūfa dar ḥavālī-i Sārī (A Sassanian Silver Platter: Unique Discovery near Sārī), Gudhārishhā-i bāstānshināsī, III, 1956, pp. 329–64.

Talish. This is a mountainous zone near the Caspian shore of Azerbaijan. Here have been discovered many tombs containing objects which range in date from 2100 to 1000 B.C. and which relate to objects from Luristan and Asia Minor.

Bibliog. J. De Morgan, Recherches au Talyche persan, Mém. de la délégation en Perse, VIII, 1905, pp. 251–341; B. Nikitine, Notice sur la province persane de Talech, Rev. du monde musulman, I, 1922, pp. 121–38; J. De Morgan, La préhistoire orientale, Mém. de la délégation en Perse, III, 1927, pp. 185–226; C. F. A. Schaeffer, Stratigraphie comparée et chronologie de l'Asie occidentale, London, 1948, pp. 404–43.

Tureng Tepe. This important prehistoric center is about 10 miles east of Gurgan. Three levels of a necropolis have been excavated, revealing objects which are related to finds from Tepe Hissar III. Excavations at Shāh Tepe Buzurg have yielded similar pottery.

Bibliog. F. R. Wulsin, Excavations at Tureng Tepe, near Asterabad, B. Am. Inst. for Persian Art and Archaeol., II, 1 bis, 1932, sup., pp. 2–12.

Teheran region. Alamut. Here are the remains of the famous Ismailite fortress of the Assassins, situated on a rocky crag two days' journey northeast from Qazvin.

Bibliog. C. Huart, La forteresse d'Alamut, Mém. de la Soc. linguistique, XV, 1907, pp. 130–32.

Ardistan. This village on the road between Kashan and Nayin contains one of the most interesting Seljuk monuments in Iran, the Masjid-i-Jāmiʿ. The earliest phase of its construction predates the spread of the four-liwan mosque type but seems to be later than the two-domed type of the Isfahan Masjid-i-Jāmiʿ. The mosque was erected on the site of an earlier Arab type of mosque, of which traces still remain. The domed sanctuary was the first section to be erected; later (1158–60) the building was transformed into a mosque with four liwans and the decoration of the sanctuary was renewed. A madrasah was added, and in the first half of the 15th century the north liwan was reconstructed. The south liwan is still the most beautiful example of Islamic architecture in Iran. Near the Masjid-i-Imām Ḥasan is the remaining minaret from the portal of a Seljuk madrasah that has now disappeared; this is perhaps the earliest extant example of a portal flanked by two minarets.

Bibliog. A. Godard, Ardistan et Zawaré, Āthār-e Īrān, I, 1936, pp. 285–309.

Chandar. This site is located in the region of Teheran on the road to Khurvin. Here was discovered a necropolis with ceramics and bronzes related to those of Luristan.

Bibliog. L. Vanden Berghe, Archéologie de l'Iran ancien, Leiden, 1959, p. 124.

Chashma-i-ʿAlī Tepe. At this site, which lies between Teheran and Rayy, excavations have revealed several levels — Seljuk, Sassanian, and Parthian (a temple with ceramics and coins). Here also are prehistoric remains including ceramics of the types of Tepe Sialk I, II, and III.

Bibliog. R. De Mecquenem, Notes sur la céramique peinte archaïque en Perse, Mém. de la délégation en Perse, XX, 1928, pp. 115–21; E. F. Schmidt, The Persian Expedition at Rayy, B. Pa. Univ. Mus., V, 1935, pp. 41–49.

Damavand (Demavend). This site is about 35 miles northeast of Teheran. Objects of the Parthian period were found in a necropolis in the vicinity. The Masjid-i-Jāmiʿ is one of the later examples (11th cent.) of the Arab type of portico mosque, surviving in a period in which the Iranian type of mosque, the domed sanctuary, already predominated. Damavand has some examples of ancient tomb towers, the most notable of which is the one called the Imāmzāda ʿAbdullāh (ca. 1300).

Bibliog. M. B. Smith, Le Masdjid-i Djuma de Demawend, Ars Islamica, II, 1935, pp. 153–73; D. N. Wilber, The Architecture of Islamic Iran, The Il-Khānid Period, Princeton, 1955, pp. 131–32.

UP State Museum, Lucknow

Gulpaygan. This important city is west of Qum. The original Masjid-i-Jāmiʿ, built between 1105 and 1118, includes the domed sanctuary; it is the second earliest remaining example of the Iranian type of mosque, the earliest being that at Niriz. There are many Qajar additions. The Imāmzāda Hifdātān of the Safavid period has a certain interest. Here also is a Seljuk minaret.

Bibliog. A. Godard, Les anciennes mosquées de l'Iran, Āthār-e Īrān, I, 1936, pp. 183–210 at 193; A. Godard, Voûtes iraniennes: Les coupoles, Āthār-e Īrān, IV, 1949, pp. 259–325 at 292.

Kashan. The general appearance of this important city is one of the most characteristic in Iran. Its name is connected with the typically Iranian architectural decoration, ceramic inlay or kashi. Few of the early monuments remain. The Masjid-i-Jāmiʿ of the 11th–12th century has been extensively rebuilt; from the Seljuk period there is only one minaret, but it is one of the earliest in Iran (1073–74), in age second only to that of Sava. Another minaret stands isolated. The Masjid-i-Maidan in its present form is of the Timurid period. It contained a noteworthy mihrab of 1226, which has been removed to the Staatliche Museen, Berlin. During the Safavid period the court often resided at Kashan. The Imāmzāda Ḥabīb ibn-Mūsā, probably Ilkhan in date, contains the tomb of Shah ʿAbbās I (d. 1629). ʿAbbās II built the dam on the Quhrud. The Bāgh-i-Fīn in the city environs, slightly beyond Tepe Sialk, was built by ʿAbbās I, who erected a palace in it; whatever remains is due to Fatḥ ʿAlī Shah. It contains the best extant examples of wall paintings from a period in which the secular architecture was certainly superior to the religious. The latter is represented in Kashan by such famous buildings as the Madrasah-i-Shāh, which, however, have little intrinsic architectural interest.

Kühnel, Zwei persische Gebetnischen aus lustrierten Fliesen, Berliner Mus., XLIX, 1958, pp. 126–31.

Khurha. This site lies southeast of Qum, on the Araq–Kashan road. The two columns with Ionic capitals which are preserved here are the most notable Seleucid remains in all Iran.

Bibliog. E. E. Herzfeld, Am Tor von Asien, Berlin, 1920, p. 32.

Khurvin. This important prehistoric center is about 50 miles northeast of Teheran. The necropolis, which dates from the late 12th century, has yielded unpainted pottery and bronzes; the objects are related to those from Tepe Sialk A and B, Tepe Giyan Ib and c, and Hasanlu. It is one of the earliest necropolises, going back to the first settlement of Iranian populations on the plain.

Bibliog. L. Vanden Berghe, Khurwin (Iran): Nécropole des premières tribus iraniennes (Pub. Inst. h. et archéol. néerlandais de Stamboul, VII), Leiden, 1959.

Naysar. This village lies on the Dalijan–Kashan road. One of the most interesting and well-preserved Sassanian fire temples is found here.

Bibliog. A. P. Hardy, Le monument de Neisar, Āthār-e Īrān, III, 1938, pp. 163–66.

Natanz. This city is near Kashan. From the pre-Islamic period are the remains of a Sassanian fire temple. The city is especially important for a very famous Ilkhan complex (1304–25) comprising a mosque with four liwans and a domed octagonal sanctuary, the tomb of Sheik ʿAbdu 's-Ṣamad al-Iṣfahānī, a khankah portal, and a minaret. All are richly decorated with glazed and unglazed ceramics and brick. The Masjid-i-Kūcha-i-Mīr has a Seljuk mihrab. Natanz possesses a few interesting mausoleums and some important examples of Qajar secular architecture, which are, however, poorly preserved. The decline of the city is relatively recent.

Herzfeld, Damascus, Studies in Architecture, I: The Shrine of Sheikh ʿAbd al-Ṣamad, Ars Islamica, IX, 1942, pp. 37–40; E. Schroeder, M. Godard's Review of the Architectural Section of SPA, Ars Islamica, IX, 1942, pp. 211–17.

Qazvin. This important city of central Iran replaced Tabriz as the capital of Safavid Persia under the dynasty's second ruler Ṭahmāsp I (1524–76). Considerably less splendid than in former times, Qazvin preserves two ancient monuments which are among the most outstanding in the history of Persian architecture. One is the Masjid-i-Jāmiʿ, a work of several generations, the history of which is easily reconstructed. The domed sanctuary was built in 1113 in the vicinity of an earlier madrasah and chapel above the foundations of a pre-Islamic monument; the liwan which leads into the Seljuk sanctuary belongs to the period of ʿAbbās II; the rest is also Safavid. The domed Ḥaydariya is also Seljuk and of the same type as the Masjid-i-Jāmiʿ and the Gulpaygan sanctuaries. The tomb of Ḥamd-Allāh Mustaufī, perhaps an Ilkhan prototype (ca. 1340) of the mausoleum with conical roof, has been very much restored. From its existence as a capital the city preserves only the ʿĀlī Qāpū, a dignified Safavid building. The Masjid-i-Shāh and the Shāhzāda Ḥusayn sanctuary are examples of early 19th-century architecture.

Qum. This important city is noted primarily for the Fāṭima bint-Mūsā shrine, in Iran second in religious importance only to Mashhad, and for its present service as seat of the highest hierarchy of the Imams, the supreme Shiite authority not only for Iran but for the entire Islamic world. Since the city was conquered in the 8th century by the tribe of the Ashʿarī Arabs, it has been an active center of the Shiite faith. The sister of the Imam ʿAlī al-Riẓā (he is buried at Mashhad) died at Qum in 816, but the first mention of the shrine built over her tomb occurs five centuries later in Ḥamd-Allāh Mustaufī; still later the pilgrimage to the tomb became important. The fact that the city was a Shiite center from early times, in contrast to other principal Persian cities (in 965 there was a religious conflict with Sunnite Isfahan), doubtless contributed to an earlier and more important development of the Fāṭima shrine than that of the numerous shrines erected over the tombs of the various members of the family of ʿAlī which are scattered throughout Iran. For this reason the traditional influx of the faithful left in the vicinity many mausoleums of early periods. Today the general appearance of the sanctuary of Fāṭima is that given it by the rather unfortunate restorations of Fatḥ ʿAlī Shah in the early 19th century. Those tombs north of the city are the more modern; the earlier are to the south, the west, and especially to the east (near the Kashan Gate). The Ilkhan period is best represented; the tombs are mostly octagonal with domes and polyhedral roofs (often conical) and furnish examples from the entire 14th century. The earliest date, 1268–69, is found on a fragment in the museum which was opened in 1936 in a building of the sanctuary; this collection is especially rich in interesting ceramics. There are many restorations. The most important tombs are the three near the Kashan Gate, which were dedicated to unknown persons and are commonly known as those of Saʿīd, Asadī, and Masʿūd. The city also contains the remains of the Masjid-i-Imām Ḥasan, a restored Ilkhan madrasah of ancient origin, flanked by minarets (ca. 1325), as well as various modern buildings.

Inst. for Persian Art and Archaeol., IV, 1935, pp. 36–38; Rāhnumā-i Qumm (Guide to Qum), Teheran, 1317 A.H. (1938); M. Siroux, Le Kalè Dukhtar de Ḳumm, Āthār-e Īrān, III, 1938, pp. 113–20.

Rayy (Rhages). The ancient center of Rhagian Media is today merely a poor suburb of what was once its own suburb, Teheran. In its vicinity are the most highly venerated shrine of the capital, that of Shah ʿAbd-al-ʿAẓim, of minor architectural interest, and the recently constructed mausoleum of Riẓā Shāh Pahlavi, the founder of the present Iranian dynasty. The tower said to be Tughril Beg's tomb (1130–40) still stands. Excavations have revealed the foundations of the Abbasside mosque built according to the Arab plan, as well as a madrasah with four liwans, from the Seljuk period, with interesting stucco decoration. Rayy was an important ceramic center in medieval times. Destroyed by the Mongols in 1220, its position later was inherited by Teheran.

Vignier and R. Fry, The New Excavations at Rhages, BM, XXV, 1914, pp. 211–18.

Sava. This town lies southwest of Teheran in a region rich in prehistoric sites, including Qalʿa-i-Dasht, where ceramics of the Hittite type (see HITTITE ART) were found. The Masjid-i-Jāmiʿ of the Seljuk period, an Iranian type of mosque with a domed sanctuary, has one of the oldest Persian minarets (1061). The Imāmzāda Sayyid Isḥāq is much restored but preserves a faïence decoration dated 1277–78. Sava was also an important pottery center of Islamic Iran.

Takht-i-Rustam. This site is about 30 miles south of Teheran. Here are two terraces for fire worship and a small, domed building.

Bibliog. M. Siroux, Takhte Rustam et Takhte Kai-kā'ūs, Āthār-e Irān, III, 1938, pp. 93–110.

Tepe Sialk. This very important prehistoric center is in the immediate vicinity of Kashan, about 3 miles southwest of the city. It comprises two hills which have yielded — along with Tepe Giyan — the most important stratigraphic material for prehistoric Iran. The north hill has two levels, the earliest of which is Sialk I, dating from the end of the Neolithic age, with five sublevels; the ceramics can be divided into four groups, and there are also stone, copper, and carved bone objects. Sialk II follows and has yielded ceramics with plant and, more often, animal motifs. At that point the population transferred to the south hill, about 2,625 ft. to the south; Sialk III shows a striking advance in architecture and ceramics, and comprises seven sublevels. The pottery from the latter part of the period assumes new shapes, has low-relief decoration, and is vitrified; representations of the human figure show a development from realism to stylization. Sialk IV is separated from III by a layer of ashes; within its tombs are jewels and alabaster vases. The pottery is no longer painted but monochrome. Proto-Elamite tablets also have been discovered; Sialk IV was influenced by southwest Iran. After Sialk III, during the 3d and 2d millenniums, the site seems to have been uninhabited. A new population occupied the necropolis about 490 ft. from the hill, which is called Sialk V or Necropolis A. It contains gray pottery, occasionally painted, jewelry, and bronze and iron objects from the late Bronze Age. About 820 ft. from the south hill is the second necropolis, Sialk VI or Necropolis B, which has yielded abundant funerary objects and greatly varied ceramics. This is the necropolis of the conquerors who fortified the south hill, and its culture is the same as that of Susa, Persepolis, Luristan, Geoy Tepe, Tepe Giyan Ic, Hasanlu, and Khurvin.

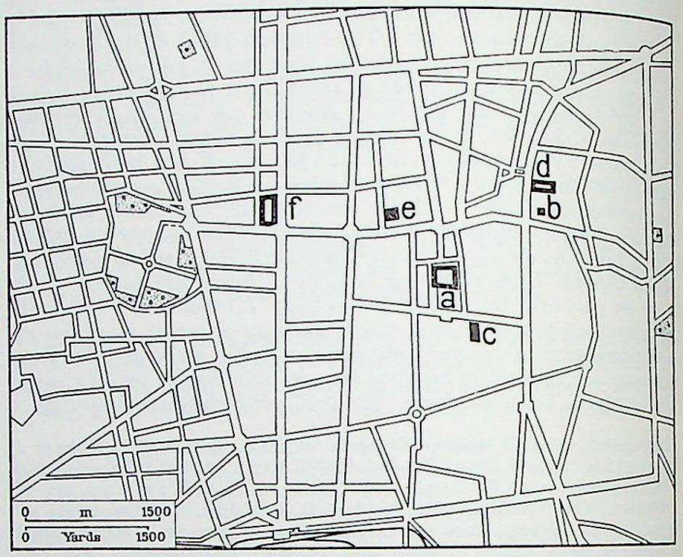
Teheran (Tihrān). The capital of Iran is about 3,935 ft. above sea level on the southern slopes of the Elburz Mountains some 35 miles southwest of Mount Damavand. Although its geographical position is not central, it has developed from a small village in the vicinity of Rayy, the major center of Rhagian Media, into the metropolis of Iran, with a population of about a million and a half; this occurred too recently, however, for the city to be of great topographic or artistic importance. The region is of considerable interest for pre-Islamic archaeology, although it has not yet been explored thoroughly. In the immediate vicinity are such centers as Rayy, Varamin, and Damavand, which are important for the history of Islamic art. The first certain mention of Teheran goes back to 1116; the first brief description is in Yāqūt's geography (early 13th cent.), but this does not preclude more remote origins of the early village, and, indeed, this can be indirectly confirmed. Teheran slowly began to develop from the time Rayy was razed by the Mongols in 1220. In the mid-14th century it was a fair-sized town. In the early 15th it was visited by González de Clavijo, who found there a building intended for the royal visits. In the Safavid period Shah Ṭahmāsp added a bazaar and surrounded it with walls and towers, which still appear in a plan from the mid-19th century; on the site of the later citadel, which still stands, Shah 'Abbās I built a palace. In 1618 Pietro della Valle found Teheran to be larger though less populous than Kashan. Shah Ḥusayn, the last of the Safavids, resided there in 1720 just before the Afghan invasion; two old city gates appear to have been built by the Afghans. Teheran also participated in the political events of the period of Nādir Shah, but, above all, it attracted the attention of the Zand chief Karīm Khan, who, in 1760, built a palace there and considered making it the capital, which it later became in 1785–86 under the Qajar dynasty. These rulers chose the city because of its closeness to Gurgan, their hereditary lands, rather than for practical political reasons. (It has been thought that their purpose was to defend the northern borders of the empire.) The modern Qajar city has developed steadily from south to north, that is, from the plains to the mountains. In 1796 it was a square tract slightly over 2 sq. miles and somewhat sparsely populated; Aqā Muḥammad built there the palace of the citadel. In 1808–09 the perimeter was 4–5 miles and the city had walls and a moat. In 1811 there were 6 gates, 30 mosques and schools, and 300 baths. In 1817 there were said to be 8 gates with great towers, although even in 1838 foreign travelers received the general impression that



Plan of central Teheran. Chief monuments: (*a*) Gulistan Palace; (*b*) Sipāhsālār Mosque; (*c*) Masjid-i-Shāh; (*d*) Majlis (Parliament); (*e*) Archaeological Museum; (*f*) Imperial Palace.

Teheran was the poorest of the large Persian cities. Two plans — those of Berezin (1842) and Krzizh (1857) — give an idea of the urban activity in the capital in this early phase of its development. The area of the city was slightly over 3 sq. miles, about one-tenth of which was occupied by the great parallelogram of the citadel. The royal palace had four courts and numerous buildings. The only public square was the Maidan-i-Shāh south of the citadel. Between 1869 and 1874 the second stage of development began, under Nāṣir al-Dīn; the walls and moat were eliminated and Teheran expanded in all directions, assuming the form of an octagon surrounded by new fortifications of the French type with 12 gates. At the same time the new squares of the Tūp Khāna and the Maidan-i-Mashq were built. The countryside to the north was used to form two parallel arteries, Lālazār and 'Alā' al-Daula, running north from the Tūp Khāna and accommodating the foreign embassies. This residential area gradually became the new center of the city, and the citadel zone in the south remained only the commercial center, with its bazaar, which is very large but not sufficiently so as to rival that of Isfahan. A third stage of development coincided with the reign of Riẓā Shāh Pahlavi (1925–41). New highways were constructed, as well as many buildings of minor architectural interest, often inspired by pre-Islamic — Achaemenian and Sassanian — styles. As the city was modernized, the Qajar legacy became less evident. Modern Teheran has become the urban model (a rather monotonous one) for the renewal and regeneration of all the other large cities in the country, with its major parallel and perpendicular streets forming a grid. Its growth was interrupted by World War II but afterward was vigorously resumed. Neoclassical (neo-Iranian) forms were abandoned, and buildings were inspired by modern Western architecture; the city extended north toward the suburb of Shamiran. The most recent public constructions are the airport of Mihrabad, the east–west boulevards in the northern zone, the university complex designed by the French architect A. Godard, the Majlis or House of Parliament (1958–59; architects, M. Foroughi and H. Ghiai), the casino (1959–60; architect, H. Ghiai), the banking and commerce center (National Bank of Agriculture, 1958; architects, Foroughi, Sadeghe, and Zafar), a large cinema (Radio City, 1958; architect, H. Ghiai), hotels, residential areas, sports facilities, and the great station of the Trans-Iranian Railroad. Religious architecture in Teheran is represented almost exclusively by the Masjid-i-Shāh, begun in 1809 and completed about 1840, and by the mosque of the Sipāhsālār (1878–90). The secular architecture is very interesting. The Qajar style, which is not without European inspiration and motifs

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

has left in the city and its environs various architectural works, the smaller examples of which are perhaps finer than the large royal Gulistan palace (early 19th cent.), which now houses a museum founded in 1894, and the Shams al-'Imāra (1875). In the environs, the palaces of 'Ishratabad, Sa'dabad, Niyavaran, Sahib-i-Qirani, Qaṣr-i-Qājār, and Daushan Tepe are notable. The Teheran Archaeological Museum (founded in 1936) contains important collections from every art period in the country's history.

Varamin (Veramin). This town is in the vicinity of Teheran. On the plain are the remains of a Sassanian structure with ceramics and stuccowork. The impressive Ilkhan Masjid-i-Jāmi' (1322–26), once with four liwans, is in the residential area. The domed sanctuary with its liwan, the portal on the opposite side of the court, and portions of other structures remain in an excellent state of preservation; the decorations are of interest. Notable too are the Imāmzāda Yaḥyā, a tomb chamber of the latter half of the 13th century, which is finely decorated and surrounded by modern buildings; the tomb said to be that of 'Alā ad-Dīn (1289), with fine examples of faïence and brick decoration; the portal of the Masjid ash-Sharīf (1307); and the Imāmzāda Shāh Ḥusayn (ca. 1330).

Zavara. This village is about 7 miles northeast of Ardistan. The Masjid-i-Jāmi' is the earliest known example of a mosque with four liwans (1135–36). In structure it is similar to the Masjid-i-Jāmi' of Ardistan. There are excellent examples of stucco decoration. Also of interest is the Seljuk Masjid-i-Pā Minār, with a minaret (1068–69) and decorative elements, some of which are Ilkhan.

BIBLIOG. A. Godard, Ardistan et Zaware, Āthār-e Īrān, I, 1936, pp. 285–309.

Isfahan region. Abarqūh. This site is about 85 miles southwest of Yazd. Among its monuments are the Gunbad-i-'Alī, an octagonal tomb tower from the Seljuk period (1056–57); the tomb of al-Ḥasan ibn-Kay Khusrau (ca. 1318–20), adjacent to the remains of a structure of 1415–16; the portal of the Masjid-i-Niẓāmiya, with two truncated minarets (ca. 1325); the Gunbad-i-Sayyidūn (ca. 1330); the Gunbad-i-Sayyidūn Gul-i-Surkhī (ca. 1330); the Masjid-i-Jāmi', with four liwans, perhaps earlier but primarily Ilkhan in its present state (VII, PL. 400; date of the mihrab, 1337–38); and the tomb of Pīr Ḥamza Sabzpūsh, rebuilt but retaining its early mihrab.

BIBLIOG. A. Godard, Abarkūh, Āthār-e Īrān, I, 1936, pp. 47–72; D. N. Wilber, The Architecture of Islamic Iran: The Il-Khānid Period, Princeton, 1955 (reviewed by M. B. Smith, JAOS, LXXVI, 1956, pp. 243–47).

Ashtarjan. This village is in the area of Falavarjan, about 5 miles north of Isfahan. The Ilkhan Masjid-i-Jāmi' (1315–16) has a domed sanctuary, a liwan, a court, and a portal with two minarets; it is richly decorated. The Imāmzāda Rabi'a Khātūn contains a mihrab of 1308.

BIBLIOG. M. B. and K. Smith, Islamic Monuments of Iran, Asia, XXXIX, 1939, pp. 213–16; Guide du Musée archéologique de Téhéran, Teheran, 1948, p. 54.

Buzan. This village is about 2 miles east of Isfahan. The complex, whose art historical interpretation is controversial, includes a mosque and a domed sanctuary. The Imāmzāda Karrār is Seljuk; some of the elements may be Ilkhan.

BIBLIOG. M. B. Smith and E. E. Herzfeld, Imām Zāde Karrār at Buzun: A Dated Seldjūk Ruin, Archaeol. Mitt. aus Iran, VII, 1935, pp. 65–81.

Dashti. This village is about 5 miles southwest of Isfahan. Here are an Ilkhan mosque, with a domed sanctuary and a monumental portal (ca. 1325), and a minaret.

Garladan. This village is about 5 miles west of Isfahan. The tomb of 'Amr 'Abdullāh, with an Ilkhan liwan (ca. 1315), is flanked by the famous pair of "moving" minarets, one of the tourist attractions of the Isfahan area. About a mile away on a hill are the ruins known as the Atashgāh of Isfahan; their origins are Sassanian, but the present remains are mostly Islamic.

Gaz. This village is in the vicinity of Isfahan. The Masjid-i-Buzurg, with four liwans, is a monument in which elements of various periods are overlaid. The earliest parts, including the minaret (ca. 1080), are from the Seljuk period. The western liwan is Ilkhan (ca. 1315). Some buildings have been recently reconstructed.

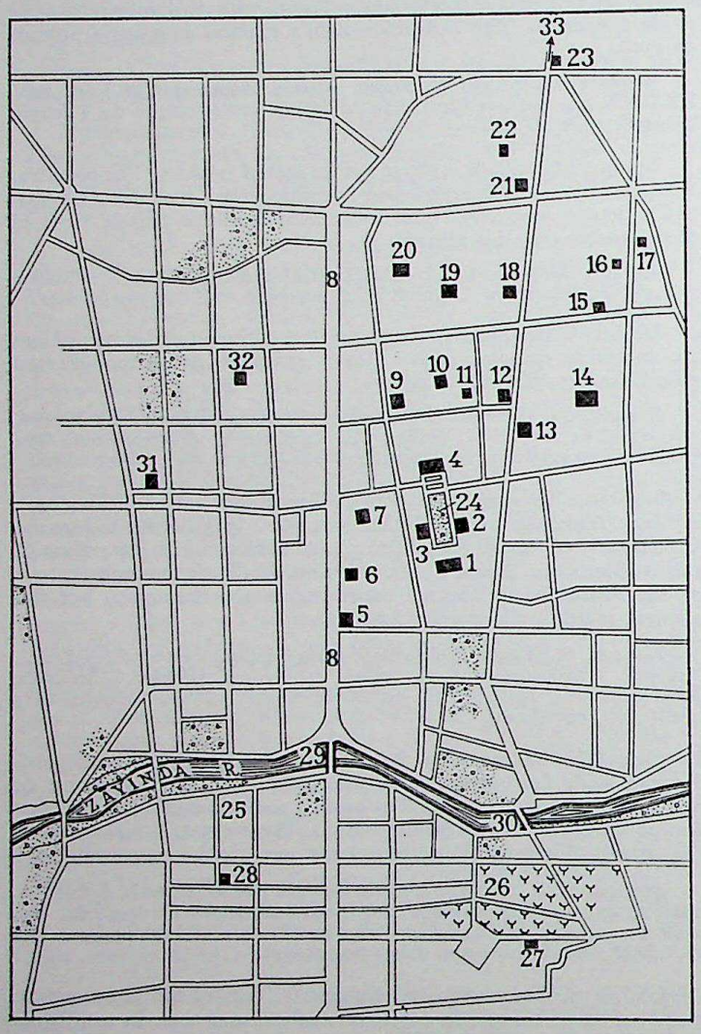
Isfahan (Gabae, Aspadana, Sipahan). This is the great artistic center of Islamic Iran, at a height of about 4,920 ft. in the fertile oasis of the 'Iraq-i-'Ajam (the largest oasis on the eastern slopes of the Zagros Mountains) on the northern shore of the Zayinda River. It has been inhabited since earliest times and has played an important part throughout history, especially after the Arab conquest (640–44). A few column capitals from the Sassanian period have been found. The city flourished in the Buyid period (932–1055), when it was the capital, in the Seljuk period (see SELJUK ART), when it was a royal residence until Sultan Sanjar (1117–57) made Merv the capital, and in the Safavid period (see SAFAVID ART), when it was the splendid and populous residence (500,000–600,000 inhabitants) of Shah 'Abbās I (1587–1629). In spite of periods of decline —the city suffered especially from the blows of Tīmūr Lenk (1388) and from the Afghan siege and conquest (1722) — Isfahan still contains important examples from nearly every phase of Iranian architecture of the Islamic period, thus confirming the tradition that it was relatively free of earthquakes. During the Middle Ages there were two civic centers: the earliest, Gayy or Sharistan, about a mile east of the present center, and Yahudiya, the Isfahan of today. The traditional quarters of the city, some of which retain early village names (Karrān, Kūshk, Jaubara, Dardasht), are usually divided into two groups, Ni'matīkhāna and Ḥaydarīkhāna, which refer to factions in the Safavid period. In the first there are 14 quarters: Khājū, Baghkārān, Ravāsigān, Shaykh Yūsuf, Pā Qal'a, Karrān, Aḥmadābād, Maidan-i-Mīr Gulbahār, Maidan-i-Kuhna, Jaubara, Gaud-i-Maqṣūd Beg, Chanār-i-Sūkhta, Sayyid Aḥmadiyān, and Shāhshāhān; in the second, 11: Dardasht, Jamala-Galla, Nīm-Āvurd, Masjid-i-Ḥakīm, Bāgh-i-Humāyūn, Bidābād, Darwāza-i-Nau, Shish, Maḥalla-i-Nau, Chaḥār Sūq, and Shamsābād. The following list of monuments is not in accord with

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

the historic topography but follows their location in the modern urban sections and their relationship to major architectural complexes.

The Chaḥār Bāgh is the principal street of the city and, running perpendicular to the river, divides Isfahan into eastern and western halves. It is a great, tree-lined boulevard built by Shah ʿAbbās I (1598) at the edge of his city to connect his palace with the outlying gardens. It no longer serves as a park; modern buildings flank most of it, but on the eastern side still stand the palace of Hasht Bihisht, from the Safavid period (ca. 1669) but radically restored by Fatḥ ʿAlī Shah and, north of that, the notable and large madrasah



Plan of Isfahan. Chief monuments: (1) Masjid-i-Shāh; (2) Masjid-i-Shaykh Luṭfullāh; (3) ʿĀlī Qāpū palace; (4) entrance to the bazaar (Qaysariya); (5) Chaḥār Bāgh madrasah (Mādar-i-Shāh); (6) palace of Hasht Bihisht; (7) Chihīl Sutūn ("Hall of Forty Columns"); (8) Chaḥār Bāgh; (9) Mosque of Ḥakīm; (10) monument of Hārūn-i-Vilāyat; (11) Mosque of ʿAlī with minaret; (12) Imāmzāda Jaʿfar; (13) Imāmzāda Ismāʿīl; (14) Mosque of Shaʿyā; (15) Dār al-Ziyāfa minarets; (16) Chihīl Dukhtarān minaret; (17) Sāribān minaret; (18) Masjid-i-Jāmiʿ; (19) Dardasht minarets; (20) Darb-i-Imām; (21) tomb of Bābā Qāsim; (22) Imāmiya madrasah; (23) Ṭūqchi minaret; (24) Maidan-i-Shāh; (25) Julfa; (26) cemetery of Takht-i-Pulad; (27) Mausoleum of Bābā Rukn al-Dīn; (28) Cathedral of the Saviour; (29) bridge of Allāhvardī Khan; (30) bridge of Khājū; (31) Mausoleum of Sitt Fāṭima; (32) Masjid-i-Sayyid; (33) Khiyābān-i-Hātif.

of the Chaḥār Bāgh, or the Mādar-i-Shāh. This famous building was constructed by Shah Sultan Ḥusayn in 1706–14; it has a court with four liwans, a domed sanctuary, minarets, and rich kashi decoration. East of the Chaḥār Bāgh is the main area of the city's monuments. It is divided into two sections — to the north the ancient center, to the south the Safavid section — by the Khiyābān-i-Sipah, which runs eastward from the Chaḥār Bāgh and passes on the north side of the Maidan-i-Shāh, and by its continuation, the Khiyābān-i-Ḥāfiẓ. The Maidan-i-Shāh is the heart of the Safavid section, while the Maidan-i-Kuhna, which contains the Masjid-i-Jāmiʿ ("Friday Mosque"), is the heart of the ancient zone. This early section is in turn divided into eastern and western parts by the Khiyābān-i-Hātif, which parallels the Chaḥār Bāgh.

The south monumental zone contains monuments along the Khiyābān-i-Sipah, between the Chaḥār Bāgh and the Maidan-i-Shāh. A large garden crossed by a tributary of the Zayinda River is perhaps a remnant of the famed park of Naqsh-i-qahān. It contains the well-known Hall of Forty Columns (Chihīl Sutūn), built by ʿAbbās I (date uncertain) but restored, if not actually rebuilt, by his successors during the 17th century; it comprises a portico with 18 wooden columns, a large liwan, and a central hall with small side rooms. The decoration, which includes painted walls and mirrored ones, is especially notable for the frescoes from the period of Shah ʿAbbās I, which recently have been very poorly restored. The four central columns of the portico rest upon four lions, which may be earlier in date. The interior houses a small museum and the regional office of the Department of Antiquities. At each of the four sides of the garden pool is a marble group brought here from the former palace of Chaḥār Bāgh. Also in the garden are some kashi from the tomb of Pīr-i-Bakrān at Linjan, a portal from the ruined mosque of the city of Qutbiya (1543), and a portal from the shrine called the Darb-i-Kūshk, of the Āq Qoyūnlū period (1496–97), with some kashi which are remnants of destroyed buildings. South of the Chihīl Sutūn are Qajar structures (with traces of a Safavid tower) which now are used by the regional government. Further east is the Tālār Taymūrī, built by Timūr Lenk but restored and presently used as an officers' club, and nearby the Tālār Ashraf of ʿAbbās II (1642–67), presently serving as the offices of the Department of Education of Isfahan. The Maidan-i-Shāh is the most famous Persian square (ca. 1,680 × 520 ft.), used as a polo field until ʿAbbās I reorganized it in 1611–12 by constructing architecturally unified buildings on the four sides of the rectangle, placing the emphasis on the monuments at the center of each side. On the east side is the Masjid-i-Shaykh Luṭfullāh, contemporaneous with the Chaḥar Bāgh (1602–04), which consists of a domed sanctuary, a corridor, and a portal and is famous for its proportions and for its kashis. On the south side is the Masjid-i-Shāh, built between 1612 and 1630, which has since been restored repeatedly. It comprises a great portal flanked by two minarets, a corridor, and a great court into which the four liwans open; the main liwan at the southwest has two minarets and leads into the domed sanctuary, at the sides of which are secondary halls. The construction technique was often poor, and the fragile decorations, mostly painted faïence, make this the lightest and airiest, if perhaps the least solid, example of Persian architecture. The palace of ʿĀlī Qāpū on the west dates from the Timurid period; it was restored by Shah Ismāʿīl and served as the residence of ʿAbbās I, whose successors restored it repeatedly. It comprises several stories and a terrace with wooden columns, like the Chihil Sutūn, and is enriched by pictorial and stucco decoration. On the north side is the Qaysariya (1619–20), the imperial bazaar, which has a great portal leading into it and a two-storied, domed court with kashi and pictorial remains. Beyond is the enormous bazaar of the city. The principal monuments east of the Maidan-i-Shāh are the Mosque of Sārūtaqī (1643–44), in the vicinity of which was once a famous Safavid palace, the Imāmzāda Aḥmad of the Safavid period but bearing a Seljuk inscription of A.H. 563 (A.D. 1168), the Safavid mosque of Sheik ʿAlī Khān and, farthest east, the Imāmzāda Zayd. The last is a mediocre Safavid edifice, but the inside contains a very interesting and unusual painting of scenes of Islamic sacred history.

The north monumental zone includes the groups of monuments between the Maidan-i-Shāh and the Maidan-i-Kuhna. East of the Khiyābān-i-Ḥāfiẓ is an intricate complex of the Imāmzāda Ismāʿīl, the Mosque of Shaʿyā and its adjoining madrasah; it includes a Seljuk minaret, but its present aspect is mostly Safavid. Farther on is the so-called "Tomb of Niẓām al-Mulk." West are the Mullā ʿAbdullāh Madrasah of ʿAbbās I, the Mosque of Maqṣūd Beg (1601–02), a very important example of Safavid architecture; the Imāmzāda Jaʿfar (ca. 1320), an octagonal tomb tower from the Mongol period; the Safavid Mosque of ʿAlī, adjoining but not connected with a Seljuk minaret from the second quarter of the 12th century; the monument of Hārūn-i-Vilāyat, of the period of Shah Ismāʿīl (1513), with splendid kashi; the great Mosque of Ḥakīm (ʿAbbās II; 1656–57); the reconstruction of an old Buyid mosque, interesting remains of which have recently been discovered and restored in the northwest portal, making it the earliest remaining example of Islamic architecture in Isfahan; the Masjid-i-Surkhī (1605–06), another important work of ʿAbbās I. The Maidan-i-Kuhna is of Seljuk origin; also in the zone are the Safavid madrasah of the Kāsagarān, and the Masjid-i-Jāmiʿ, the most complex, rich, and typical extant monument of Eastern Islamic architecture; it was constructed on the site of an earlier Abbasside mosque of a period prior to the 10th century. It is presently in the form of a mosque with four liwans opening onto a central court surrounded on all sides by a continuous wall of buildings of various periods. The oldest section consists of the great domed hall immediately south of the southern liwan and of another, smaller, domed hall, the Gunbad-i-Khāki, at the opposite end north of the northern liwan but not immediately adjoining it because it was once separated from the mosque. Both

UP State Museum, Lucknow

domes were built between 1072 and 1092, in the Seljuk period. The four liwans and the many-aisled corridor which surrounds the court on all four sides and connects the liwans were erected later, after the fire of 1121–22 but still within the Seljuk period. The great mihrab on the western side of the surrounding corridor dates from 1310; it was built by the Mongol Öljeitü (Uljeitu). Also Mongol but of uncertain date is the stucco decoration of this corridor. Of 1366–67 (Muẓaffarid period) are the madrasah between the eastern side of the Seljuk corridor and the eastern exterior wall of the mosque; various additions in the same eastern section; the aisled hall which connects the northern liwan with the Gunbad-i-Khākī; and, probably, the hall which interrupts the Seljuk corridor on the western side, now enclosing the mihrab of Öljeitü. The winter prayer hall (*shabistān*) between the western side of the Seljuk corridor and the western outer wall dates from 1447–48 (Timurid period). The two halls at the southwest corner are Safavid; one has a nave with columns (1584) and the other, west of the Gunbad-i-Khākī, is the funerary chapel of Muḥammad Bāqir Majlisī (1681). In modern times the architectural complex has been subject to restoration and additions. The kashi decoration of the interior of the southern liwan and of the liwan façades is from the Āq Qoyūnlū period (1475–76), while most of the other kashi is Safavid. In the section of the Masjid-i-Jāmiʿ, to the west, are the two Ilkhan minarets of Dardasht, flanking the portal of a destroyed building next to a domed structure, the work of Bakht-i-ʿĀqā, perhaps in 1158–59. Here also is the Darb-i-Imām, a building of Qara Qoyūnlū origin with many later changes and additions; it preserves in the portal of Jahān Shah (1453) the most perfect remaining example (along with the remains of the Masjid-i-Kabūd of Tabriz) of colored kashi Persian architecture. East of the Khiyābān-i-Hātif are the two Mongol minarets of the Dār al-Ziyāfa (1325–50), the Seljuk minaret of Chihīl Dukhtarān (1107–08), and that of Sāribān, perhaps the most beautiful in the city (mid-11th–12th cent.). A monumental group north of the Maidan-i-Kuhna consists of two works from the Muẓaffarid period, the tomb of the theologian Bābā Qāsim (1340–41), especially noteworthy, and its adjoining Imāmiya madrasah (mid–14th cent.). Further west are the Buqʿa-i-Shāhshāhān, of Timurid origin, the Safavid Shaʿfiya Madrasah, in a very poor state of preservation, the so-called "Tomb of Bū ʿAlī," and the truncated minaret called "the Guldasta." (The last two are both of Seljuk origin.) At the north edge of the city is the minaret of Ṭūqchi, of the Ilkhan period (1330–50), the last remnant of an old mosque.

The quarters west of the Chaḥār Bāgh contain some interesting monuments. (The following list begins with the southernmost building.) These include the madrasah of Shamsābād (1713–14); the Lunbān Mosque, Seljuk in origin but Safavid in its present aspect (1669–70); the Mausoleum of Sitt Fāṭima, with nearby Safavid tombs; the Masjid-i-Sayyid (1840); the Mosque and Ḥammām of ʿAlīqulī Āqā (1710–11); and the Sardarb-i-Shaykh ʿAlī Masʿūd, the portal of a khankah no longer standing (1489–90), with splendid Aq Qoyūnlū kashis.

Spanning the Zayinda River are five bridges, here listed from west to east. Least interesting is the bridge of Marnān. The bridge of Allāhvardī Khan lies at the south end of the Chaḥār Bāgh and is contemporaneous with it. The bridge (and aqueduct) of Chūbī was built by ʿAbbās I in 1611–12. On the ruins of an Āq Qoyūnlū bridge ʿAbbās II built the bridge of Khājū in 1643–44. The bridge of Shahristān is of Sassanian origin and has Seljuk restorations.

Of the surburbs south of the Zayinda River, the westernmost one is Julfa, built by Shah ʿAbbās I expressly for the Armenians who emigrated there in about 1603. It had 24 Gregorian shrines, of which 13 remain. Among these the principal ones all date from the first half of the 17th century: the Cathedral of the Saviour, the Church of Bethlehem, and the Church of St. Mary. Their architecture is Persian rather than Armenian, and in the cathedral paintings Italian influences mix with Iranian traditions. Beyond Julfa are the ruins of the late Safavid palace of Farahabad, a non-Islamic cemetery called the "Armenian cemetery," the Hazār Jarīb garden of ʿAbbās I, and the Takht-i-Pulad, an Islamic cemetery with a surprising complex of tombs and mausoleums of various periods. Of particular note is the Mausoleum of Bābā Rukn al-Dīn, built by ʿAbbās I (1929–30); it is pentagonal with a liwan portal, a conical roof, and a central room with large niches and kashi decoration in a poor state of preservation. It is an outstanding monument of Safavid architecture.

Hatami, Welcome to Isfahan, Teheran, 1959.

Kaj. This village is about 10 miles southeast of Isfahan. Its Ilkhan Masjid-i-Jāmiʿ, with a domed sanctuary (ca. 1325), possibly was erected adjacent to remains of one of the earliest Persian mosques.

Bibliog. E. Schroeder, Preliminary Note on Work in Persia and Afghanistan, B. Am. Inst. for Persian Art and Archaeol., IV, 1936, pp. 130–35; E. Schroeder, M. Godard's Review of the Architectural Section of SPA, Ars Islamica, IX, 1942, pp. 211–17.

Kuhpaya. This site is on the Isfahan–Nayin road about 40 miles east of Isfahan. The Masjid-i-Miyān-i-Dih is perhaps earlier than its stucco mihrab and its mimbar, which is decorated with kashi and dated 1335.

Bibliog. D. N. Wilber, The Architecture of Islamic Iran: The Il-Khānid Period, Princeton, 1955, p. 181.

Linjan. A monument known as the Pīr-i-Bakrān is among the most characteristic of the Ilkhan period, especially for its stucco decoration. It includes a domed sanctuary and a liwan which was transformed into a tomb by Sheik Pīr-i-Bakrān (d. 1303). Its dates range from 1299 to 1312.

Bibliog. A. Godard, Isfahan: Le tombeau de Pir Bakrān, Āthār-e Īrān, II, 1937, pp. 29–35; M. Bahrami, Some Examples of Il-Khanid Art, B. Am. Inst. for Iranian Art and Archaeol., V, 1938, pp. 257–60.

Nayin. This city is about 85 miles east of Isfahan. It is famous for the structure called the Ḥusayniya (13th cent.) and even more for its 10th-century Masjid-i-Jāmiʿ, one of the earliest extant monuments of Iranian Islam. It is an Arab type of mosque, with a columned prayer hall which is richly decorated in a style comparable to that of the roughly contemporary Abbasside buildings of Samarra and the Mosque of Ibn-Ṭūlūn in Cairo; the technique of execution differs, however. The portal and minaret are later in date. The Masjid-i-Bābā ʿAbd-Allāh is Ilkhan (1300–36).

Bibliog. H. Viollet and S. Flury, Un monument des premiers siècles de l'Hégire, Syria, II, 1921, pp. 226–34, 305–16; S. Flury, La mosquée de Nayin, Syria, IX, 1930, pp. 43–58; M. B. Smith, The Wood Mimbar in the Masdjid-i Djami, Nain, Ars Islamica, V, 1938, pp. 21–28.

Sin. This village is about 15 miles north of Isfahan. A Seljuk minaret of 1132 preserves the earliest dated faïence architectural decoration of Iranian Islam. Here also is an Ilkhan caravanserai (1330–31).

Bibliog. M. B. Smith, The Manars of Isfahan: Sin, Āthār-e Īrān, I, 1936, pp. 327–31; A. Godard, Isfahan, Āthār-e Īrān, II, 1937, pp. 1–176 at 170; M. B. Smith and C. C. Miles, Two Dated Seljuk Monuments at Sin (Isfahan), Ars Islamica, VI, 1939, pp. 1–15.

Yezd (Yazd). This well-known city of central Iran is about 195 miles southeast of Isfahan. Along with Kashan, it is perhaps the Persian city which has best preserved its ancient appearance, charac-

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

terized by numerous domes and towers used to ventilate the houses during the warm season, according to the system in use in central Iran. The bazaar presents a picturesque appearance, with its characteristic 19th-century structures. Yezd and its environs contain most of the Zoroastrian remains in Iran, including a number of fire temples and towers of silence. The principal monuments today are mainly Ilkhan, but the Seljuk and Timurid periods are also well represented. The region has not yet been explored thoroughly; an Achaemenian bas-relief was found by chance near the city. The immense Masjid-i-Jāmiʿ, built between 1324 and 1365, comprises a great portal with a liwan flanked by two minarets, a court with liwans, and a sanctuary with two domes and two lateral prayer halls. Most of the decoration is from the late 14th and 15th centuries. To the east are the remains of a pre-Seljuk mosque. The remaining domed funerary chamber of the Vaqt ū Sāʿat Mosque, in the vicinity, was part of a complex erected by the Sayyid Rukn al-Dīn in 1325. Other noteworthy buildings include the Imāmzāda of the Duvāzdah Imām (1037), with elegant architectural elements and the remains of frescoes; the Shah ʿAbd-al-Qāsim Mosque with a mihrab dated in the 11th–12th century; the Ḥusaynī Haft, of the post-Seljuk era; the Shamsiya madrasah (ca. 1365), with rich decoration; the Buqʿa-i-Shāh Kemālī (1390), in ruins; and the Mosque of Mīr Chaqmaq (1437), with an interesting portal and mihrab. The remains of the walls are among the most notable in Iran, after those of the little city of Bam.

IRANIAN PRE-SASSANIAN ART CULTURES. The treatment of the artistic development of pre-Islamic Iran in two articles — the present, dealing with the pre-Sassanian periods (protohistoric, Achaemenid, Parthian), and a subsequent one on Sassanian art (q.v.) — has the practical advantage of conforming to a certain tradition among scholars. Indubitably Sassanian culture offers peculiar aspects that justify separate consideration, for not only did it represent a lively reaction against Parthian culture, which with regard to Iranian art constitutes a problem apart (see PARTHIAN ART), but it had immense irradiation (see ASIA, CENTRAL) and a significant influence on the formation of Islamic art itself (see ISLAM). Yet it is indisputable that the art of the Iranian world, from its earliest manifestations, exhibited constant and unmistakable characteristics, in spite of a multiplicity of trends and currents and an abundance of foreign contributions (Mesopotamian, Greco-Roman, etc.). The art of "Outer Iran," so called — that is, of the peoples of Iranian extraction who lived in a nomad state or stayed beyond the confines of Iran proper — presents special problems. On the one hand, this art is derivative, colored by the artistic traditions with which these peoples came into contact; on the other, it grafts itself onto these same traditions with markedly individual stylistic and typological elements. It is briefly touched on here and treated more fully elsewhere (see GRECO-BOSPORAN AND SCYTHIAN ART; INDO-IRANIAN ART; KHWARIZM; KUSHAN ART; STEPPES CULTURES).

SUMMARY. Prehistory and protohistory (col. 248): *The oldest cultures; The 3d millennium* B.C.*; The 2d millennium* B.C.*; The arrival of the Iranians; The early 1st millennium* B.C.*; The Cimmerians and Scythians in Iran.* The art of the Cimmerians and the Medes (col. 254): *The Luristan bronzes; Median art.* The treasure of Zawiyeh and Scythian art (col. 260). Achaemenid art (col. 267): *Civil architecture; Funerary monuments; Religious structures; Sculpture and minor arts; Value and significance of Achaemenid art.* Parthian art (col. 279).

PREHISTORY AND PROTOHISTORY. *The oldest cultures.* From the Paleolithic era to the Neolithic, which has left traces of a rudimentary culture, the inhabitants of the Iranian Plateau lived on the mountains encircling it, for the central depression, now a desert, and the valleys were filled with water. As the valleys drained, men gradually descended from their mountain cave dwellings. By the middle of the 5th millennium B.C. there existed a series of settlements disposed along a crescent whose points faced eastward and whose outline followed what at that time was probably still an inland sea.

Tepe Sialk, near Kashan, about 150 miles south of Teheran, was the first site to reveal the art of the Neolithic period, before man was acquainted with the use of metal (see ASIATIC PROTOHISTORY). At a time when he had only coarse potter's tools and fashioned crude black pottery of a kind also discovered in his previous mountain home, he made his first essays in vase painting. On large bowls of irregular shape he would draw horizontal and vertical lines imitating basketwork; thus, painted pottery had its origin in the imitation of the modest materials of daily use. Although the valuable finds at Tepe Sialk do not permit the assertion that the Plateau was the birthplace of prehistoric painted pottery, such a hypothesis cannot be excluded. More important than pottery during this period was bone carving. A human figure serving as the handle of a flint, to which it was fastened with bitumen (Louvre; see Ghirshman, 1954, pl. 1), shows the tendency to use naturalistic details in representing human beings and seems to indicate that man had already long practiced this art, certainly at the time when he was still living in the mountains.

In the next phase of Iranian culture, during the first centuries of the 4th millennium, the potter achieved more vigorously realistic decorations. Slowly improving his tools, he succeeded in shaping goblets, red in color, on which he drew series of birds, boars, and ibexes in simple black line. The gracefully bounding animals point to a keen sense of observation and to that vision of living things nature offers to the hunting man.

During the following phase — that embracing almost the entire 4th millennium and one of the most appealing in prehistoric Iranian art — the forms of vessels became more complicated, more elaborate. The unstable goblet evolved into the footed cup. The cup developed into the chalice, whose borders were enlivened with rows of birds or panthers, while the body was covered with geometric patterns. The potter continued to reproduce the ibex, which remained a favorite subject of Iranian artists for thousands of years.

In time man learned to make use of copper, the first metal known to him; he was entering the chalcolithic ("cuprolithic") stage, when some of his tools and weapons were already of copper, but stone was still in general use — as it was to remain for a long time. The potter mastered the wheel, which enabled him to achieve graceful and well-balanced forms. A regular kiln, in which he could adjust the temperature of the fire, allowed him the luxury of varying the colors of his vessels, in which gray now appeared as well as red, brown, and buff.

The entire Plateau was dedicated to the art of vase painting. Despite unity of conception, there was great variety in realization; every little center of production introduced its personal note. Naturalism little by little shades into stylization, or rather a tendency to simplify, to give prominence to one characteristic, and to synthesize. On a chalice from Tepe Hissar, near Damghan in northeastern Iran (Teheran, Archaeol. Mus.; see Ghirshman, 1954, fig. 12), the panther is reduced to a triangle. On one of the fine goblets of Susa I (i.e., of the earliest period represented at Susa, a site in the plain skirting the Plateau on the southwest) two triangles joined at the points form the body of an ibex, while a large volute describes the horns; the waders circling the mouth of the vase resemble musical notes — their necks, like the horns of the ibex, are

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

State Museum Library Lucknow

an expression of the synthesizing tendency (PL. 119). To return to the Plateau itself, a prehistoric site on a hill near Persepolis reveals that the potter arrived at nearly complete abstraction of the animal's body, giving prominence to the horns with broad, powerful strokes of the brush (see Ghirshman, 1954, fig. 11).

The 3d millennium B.C. The cultural unity of Iranian painted pottery, which had endured for over a millennium, was disrupted at the beginning of the 3d millennium under the impact of external forces whose origins it is not always easy to uncover. Susa, surely under the influence of Mesopotamian civilization, abandoned painted decoration; this was the epoch when man realized one of his most wonderful inventions, that of writing. The new current spread beyond the plain of Susiana, penetrating to the center of the Plateau, where manifestations of it have been recognized at Tepe Sialk IV, not only in the common pottery but also in fine jewelry and tablets with proto-Elamite writing; these tablets, well represented at Susa, are the only ones that have been found on the Plateau.

The art of northeastern Iran, too, underwent profound changes, likewise provoked by external currents, among which certain ethnic movements should perhaps be included. Painted pottery, which had flourished in the 4th millennium, was gradually replaced by a new type of production hitherto unknown on the Plateau: a black lustrous ware (II, PL. 1), whose forms, at first imitations of previously familiar ones, later became more varied; the type persisted throughout the 3d millennium and apparently thereafter. During this phase of northeastern Iranian art, which probably affected the whole vast plain lying along the southeastern shore of the Caspian Sea, there was great activity in metalwork, including the making of jewelry. The origin of the new trend remains obscure, and, although it gained hold in a region regarded as one of the gateways of the Plateau for invaders from the east — that is, from central Asia — in certain of its manifestations links with western civilizations, especially Mesopotamia, are detected.

The western portion of the Plateau seems to have escaped influences hostile to the art of painted pottery, and such pottery continued to be produced at Tepe Giyan and elsewhere. The jar became common. Its decoration, confined almost entirely to the shoulder, followed two parallel tendencies: sometimes it consisted of a bird or a quadruped on a clear field, sometimes of a synthesist design, such as the bird comb frequent at Tepe Giyan IV (see Ghirshman, 1954, fig. 24). At Susa, where painted decoration seems to have disappeared for several centuries, it appeared once more with the pottery of Style II, and it was later even associated with polychromy and a neorealistic style. In Elam, of which Susa was the capital, ordinary pottery soon came into its own; it was to continue in use without interruption during the long span until the final collapse of this kingdom in the 7th century B.C.

True, in the last centuries before Elam's fall, potters produced a distinguished enameled ware, often polychrome, but they never again resorted to painting. In this domain the divorce between the Elamite plain of Susiana and the Plateau was complete; the art of the sculptor and the founder, which in Elam reached the level of true masterpieces (PL. 121), seems to have brought about a deflection of taste to artistic outlets other than vase painting.

The 2d millennium B.C. Such was not the case on the Plateau, where — from what we know of its western portion, at least — man seems not to have reached the level of urban organization, and painted pottery remained in favor. To be sure, the forms of vessels changed. At Tepe Giyan III rather soberly decorated tripods made their appearance. In the next phase (Tepe Giyan II), which may be placed in the middle of the 2d millennium, the potter made small craters adorned with metopes filled with birds and suns, as well as jugs and goblets of very light, whitish clay, furnished with a button base and ornamented with lines encircling the body. The second type, known as "Khabur ware," radiated far westward, passing through northern Mesopotamia, and seems to mark an expansion originating from the Plateau. An inverse current manifested itself shortly before the end of the millennium with the "caliciforms" of Tepe Giyan I, whose silhouette and decoration derive from the pottery of the Hurrians, a people neighboring the Plateau on the north and northwest. Finally, a black pottery of different aspect, well dated in Transcaucasia about 1000 B.C., appeared in the central and western portions of the Plateau (Tepe Sialk V and Tepe Giyan I); its decoration consists of incisions with a knife or incrustations with a white material. It may be representative of other ethnic movements.

The arrival of the Iranians. The exact date when the Indo-European Aryans, or Iranians, arrived on the Plateau to which they gave their name has not yet been determined. Their settlement must have occurred not in consequence of an invasion but as the result of a slow penetration that may have extended over centuries. The first mention of the Medes and Persians, the foremost of the Iranian peoples, in the annals of the Assyrian kings does not go back further than the second half of the 9th century B.C. That life ceased on certain prehistoric hills before the end of the 2d millennium is very significant. It is believed that the beginnings of nomadism in Iran must be assigned to this period.

The route followed by the newcomers to reach the Plateau is not easily established. That across the Caucasus seems probable but does not exclude the plain east of the Caspian Sea, where Soviet archaeologists have brought to light the remains of a civilization similar to that of Necropolis B at Tepe Sialk. Finally, hypotheses have been advanced favoring a third route east of the Aral Sea. It is possible that the Iranians followed two of these routes, or even all three.

Be that as it may, as early as the 10th century B.C. profound changes made themselves felt in the way of life of these Aryans. The dwellings of chiefs rose on hills crowned with a fortified terrace, around which nestled the lower town. The dead were no longer buried under the houses, the practice of the previous inhabitants of the Plateau; "cities of the dead" were created at some distance from the towns. It is at Tepe Sialk that the most ancient installations of the Iranians are found — remains of the dwelling of the chief on top of an artificial mound as well as numerous tombs that may be dated to the late 9th century or even the early 8th century B.C.

Necropolis B at Tepe Sialk, with its megalithic tombs, presents the picture of an already matured society with differentiated classes. To judge from the numerous pieces of harness and weapons, the class holding power was composed of warrior horsemen. The rich had jewels made of silver, the poor, of bronze or iron. Iron was used to forge only the weapons of the rich, and bronze and copper remained widely employed.

The very abundant pottery of Necropolis B offers the most comprehensive view of this archaic phase of Iranian art. The most representative type, a long-spouted pitcher (PL. 120; II, PL. 3), to which the potter sought to give the shape of a bird, was intended to hold a liquid leaving a sediment, which settled into a crawlike pocket at the base of the spout. To increase the resemblance to a bird, the artist drew around the spout and pocket a series of triangles suggesting a collar of feathers or a pair of wings. The significance of birds in the funeral ritual of the Iranians is not known, but it seems clear that vessels of this type could serve only for libations at burials. Very often they bear a sculptural decoration, always subordinated to a specific end. This decoration might be the head of a horse surmounting the mouth of a vessel as if to guard the liquid or, as it looks elsewhere, to watch over the outflow (PL. 120). The animal is a kind of guardian of the contents, as was to be the man whose figure in relief was to decorate the body of another bird-vessel. This formula is worth noting, for it can be recognized as a trait peculiar to the products of potters and metalworkers at other sites on the Plateau and even beyond its borders. Already, too, as in the archaic Greek world, the horse, or the winged horse, made its appearance, as a symbol of the dead man or of death itself carrying him off.

The decorative conventions were firmly established. In obedience to them animals were painted on the lower portion

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

of the body, near the bottom, so that they could be seen better when the vessel was inclined to release its contents. It is again a horse that is found on a pitcher of a different type, with an upright, flattened, fan-shaped spout and a pocket painted with a human figure, usually female. Man in action is known on only two shards and one whole vessel. On one of the shards he is shown borne by a winged horse — a subject belonging to the cycle of symbolic funerary paintings. May not this winged horse be the earliest representation of the figure later known as Pegasus? On the other shard two men, face to face, with helmets and sheathed swords seem to fight without weapons in their hands. The subject is a war dance, the pyrrhic, which was part of the funerary practices of the Greeks and which the vase painting of Tepe Sialk shows to have existed among the Iranians at a period previous to its appearance in Greek art.

The only whole vessel known that represents a man in action is in Lucerne (PL. 120). On a level below the base of the handle a man is painted on one side, a lion on the other. The man is armed with a spear and a shield, widely used in lion hunting; from his belt hangs a short sword, whose sheath, very broad where the hilt would be, suggests that the weapon is an *akinakes*, or Scythian sword, which was also used by the Medes. The lion faces the hunter on the other side of the handle. Its body is silhouetted, but its eye, lips, nostril, and ear were left light, which heightens the expression of ferocity of this animal. What was intended was a hunting scene. On the one hand, there is the man, fully equipped for a hunting exploit; on the other, the animal, about to attack the man and strike him with his terrible paw. But the artist did not dare or did not know how to give the scene its real meaning of a combat between man and beast. The representation is thus unreal, frozen. The painting seems to have achieved no other end than decoration of the vessel. But if the scene corresponded to some reality, what did it refer to? A funerary vessel for libations at the burial of a hunter-warrior might well bear a representation of the exploits that illumined his life. If this were such a representation, we should have before us the first example of that funerary art which the Iranians produced throughout antiquity, sometimes as sculpture in stone, sometimes as mural painting.

In addition to pottery, Tepe Sialk has yielded weapons and tools made of metal; jewelry (in which gold was apparently not employed), including torques, bracelets, earrings, and braid ornaments; and cylinder seals, on which the subjects of the vase painters appear (see GEMS AND GLYPTICS). Sculptural representation of human beings is almost nonexistent.

The art of Tepe Sialk is an integral part of the new civilization that introduced a fresh spirit into city planning and traditions previously unknown. It reveals new conceptions as foreign to the country's past as they are instructive for the future of Iranian art, for in the art of Tepe Sialk the embryo of what was to become the art of the Persians and the Medes, as well as the "luggage" that must have accompanied the Iranian tribes to the Plateau may be recognized; it is an art permeated with a decorative sense foreshadowing the role of animals in its future manifestations, an art that from the first played no small part in suggesting to the potter the form, the plastic ornament, and the painted decoration of his principal realizations.

Nothing, in the author's view, links the work of the potter of Tepe Sialk with that of his predecessors — neither the consistency nor the firing of the paste, nor the very characteristic color of the glaze. The decoration was no longer distributed around the neck and body but was concentrated around the spout and disposed on a wide free space on the body; even at its most expressive, it might appear on the lower portion of the body, brushing the baseline.

New rhythmic laws seem to have been introduced, but their origin is yet to be ascertained; they do not appear always to follow Oriental principles. What distinguishes the Oriental conception of decoration, whether on a vase or, later, on a carpet, is the continuous, uninterrupted motif; Western taste, on the other hand, demanded a well-defined picture, delimited within a given space and having an intrinsic value. Not for the painter of Tepe Sialk those well-aligned rows of animals following one another to infinity; his animals dispose of large spaces, and we can only guess whether or not he meant to group them.

In his freedom of expression he introduced a type of spot inspired by textiles, and if the "textile ornament" reduces the verisimilitude of a scene and emphasizes the unreal character of the figures, by the same token it proclaims the freshness of an art free of the ponderousness, the barrenness, the marks of regression that were to mar the potter's product in the following century in the art of Luristan. At Tepe Sialk we witness the creative phase of an art capable of realizations not devoid of force, elegance, and even ingenuity. Undeniably the painter was animated by that spirit of clarity and measure, rhythm and symmetry, that is found also in the great achievements of Iranian imperial art, in the palaces of Persepolis and the Apadana of Susa. The pottery of Tepe Sialk is only a departure but one rich in promise.

The dawning civilization of Iran was not to disavow for some time the most ancient version of its funerary vase, naturalistically inspired but endowed with a meaning that eludes us. The vessel with an elongated spout apparently remained in use on the Plateau until the Achaemenid period.

The early 1st millennium B.C. Little is known as yet about the diffusion of the painted pottery of the protohistoric Iranians. It is certain, however, that this art continued to flourish on Iranian soil at least until the end of the 7th century B.C., for examples of it have been found in four regions, as much as several hundred miles distant from one another — Azerbaijan, Susiana, Luristan, and Kurdistan. The last two regions will be dealt with in the sections on the Luristan bronzes and the treasure of Zawiyeh (Ziviya).

From the vicinity of Maku in Azerbaijan comes a receptacle in the shape of a horse (Teheran, Archaeol. Mus.; see Vanden Berghe, 1959, pl. 150b), whose harness includes headstall and reins and whose neck bears an ownership mark, a *tamga* in the form of a lily. Its back is covered with a richly decorated and fringed saddlecloth, which was to become classic under the Achaemenids. Each half of the cloth, painted in black and red on a buff ground, represents a hunting scene in which an ibex and a panther run on a field of flowers; some birds are aligned along the border. All the animals are outlined in black, a technique that was to survive for centuries, even in the monumental Iranian murals. Their running style, with forelegs thrown forward almost parallel to the ground, is neither a flying gallop nor the Assyrian "rearing," with the body projected forward rather than up; it seems to have been employed by the artists of Urartu and is not unknown in Achaemenid art or, earlier, in archaic Greek art. The introduction of vegetation, an impulse toward representing landscape, marks an advance over the art of Tepe Sialk, but the flowers have nothing to do with reality; theirs is a conventional art. The saddlecloth must have been a copy of a piece of incrusted leather or of a piece of felt. About 1946–49 some saddlecloths were discovered in the barrows of Pazyryk (Pazirik) in southern Siberia; these are more recent by several centuries than the horse of Maku, which may be attributed to the 8th century B.C. and probably was a ritual vessel used during funeral ceremonies and then probably placed in the tomb.

From the Persian village established at Susa about the beginning of the 7th century B.C. comes a similar receptacle in the shape of a horse (II, PL. 3). Its harness resembles that of the horse of Maku; a *tamga* in the form of a lily marks its neck also. Its saddlecloth is likewise adorned with animals: boars in the flying gallop and birds.

In spite of the distance of several hundred miles that separates the sites of their discovery, the two receptacles are nearly identical. True, the artist of Susa, with his technique of silhouetted animals, has a simpler approach, but he is more concerned with rendering details. Thus, to the Maku painter's abstract landscape he opposes one in a calligraphic style. The idea of giving the vessel the shape of a quadruped may have come from the north, from neighboring countries such as Cappadocia, where the rhyton enjoyed an enduring popularity. On the other hand, presenting the quadruped in the form of

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

a horse seems to be an Iranian idea, one congenial to a people of warrior horsemen who with this auxiliary progressively extended their conquest of a new country. In the arts of Europe and of those regions of western Asia into which the Indo-Europeans had penetrated from the end of the 2d millennium or the beginning of the 1st, the horse was associated in a variety of ways with solar symbols. In this connection there is a notable frequency, on Greek pottery of the Geometric style, of the horse and of the circle surrounded by dots — motifs that recur on the breast and neck of the Susian horse. Acknowledging the religious and symbolic value of representations of the horse, one may accept the vessel in its image as a funerary object, if only because this animal appears on several vases brought to light in Necropolis B at Tepe Sialk.

The preference for monochrome pottery in Iran during the first centuries of the 1st millennium is a question not of dates but of localities. Communities have been discovered, belonging to the same stage of material culture as Tepe Sialk, that in the 9th and 8th centuries made only black, gray-black, and red pottery — this last, by the way, also common in the tombs of Necropolis B at Tepe Sialk. The Plateau has always shown local divergences in artistic expression. An example from the beginning of the 1st millennium is the necropolis of Khurvin, a little village of the southern spurs of the Elburz Mountains, west of Teheran.

All the pottery of Khurvin is monochrome — black, grayish-black, and, less frequently, red. As at Tepe Sialk, first place belongs to the long-spouted vessel, whose form, as the painted decoration has shown us, imitates the body of a bird. It is said that a receptacle without its ornament is "blind and dumb." Unfamiliar with painted decoration, the potter of Khurvin centered attention and interest on plastic decoration. His vessel "sees" with the inordinately large eyes of the protoma surmounting the spout; and it "speaks," the long spout heralding the ritual act that would cause the sacred liquid to flow through.

The conduct of funeral rites seems to have been the same at Khurvin as at Tepe Sialk, an impression confirmed by the similarities between the funerary furnishings in the two cemeteries. The forms of vessels generally do not differ in the two places, but at Khurvin additional forms are found; for example, the tripod, known on the Plateau at least since the 2d millennium. It may be assumed that in this little community of central Media the absorption of the native population by the conquerors was still under way and that the attachment to ancient forms is a mark of the force of traditions. Metalworking was considerably more advanced than at Tepe Sialk: swords are stronger and longer; jewels, of which several have been found in gold, bear representations of animals and even of human heads. In sculpture the bronzesmith revealed qualities previously unknown. He cast a helmeted warrior who wears a cuirass in the form of a wide baldric and whose oversized raised hands with palms turned outward convey an attitude of prayer (Teheran, Maliki Coll.; see Vanden Berghe, 1959, pl. 156b–c). Similar statuettes have been found among the bronzes of Luristan. The gesture of veneration with uplifted hands was to live for thousands of years in the art of different peoples.

The practice of similar funeral rites and the use, consequently, of pottery of the same kind has been ascertained during this period — datable to the 9th–8th century — on the site of Hasanlu, on the southwestern shore of Lake Urmia. There it was black ware which predominated in the production of vessels similar to those already described, provided with a long spout, whose tapering open gutter was often surmounted by a protoma or even an animal modeled in the round, which "watched" the liquid flow out. This novelty, like the frequent use of tripods, may reflect currents from the north, from that land of Urartu (q.v.) around Lake Van where bronzesmiths produced similar objects. There the bosses of bronze caldrons were adorned with likenesses of animals and human beings, whose function, once again, was to watch over the liquid. Closely related is a red clay vessel from Hasanlu, on which a human being, next to two birds, supervises the outflow of the liquid, expressing the same idea as the similar terra-cotta pitchers of Luristan. The art of the bronzesmith attained a rather high level: he fashioned tripods for caldrons and cast animals in the round; the arms from his workshops are in no way inferior to those we know from Khurvin or to the ones Luristan was to produce. That the horse played its part in the life of the community is proved by the pieces of harness that have been found.

The three sites of Tepe Sialk, Khurvin, and Hasanlu, in the character of their art and funerary traditions, in the forms of their pottery and the appearance of their jewelry, evoke for us the pre-Median civilization of Iran during the first three centuries of the 1st millennium.

The Cimmerians and Scythians in Iran. In the second half of the 8th century B.C. and perhaps even before the end of the preceding century, new invasions by peoples who came from southern Russia, after crossing the Caucasus, profoundly affected the course of history in western Asia and Iran in particular. These peoples were the Cimmerians and Scythians mentioned by the historians of antiquity, according to whom (Herodotus, I, 6, 15, 103; IV, 11 ff.; Strabo, III, ii, 12; XI, ii, 5; XIII, iv, 8) the first, nomad horsemen and breeders of Iranian origin, made numerous raids into Asia Minor, probably beginning as early as the first half of the 8th century. It is not known exactly when the Cimmerians divided into two groups, of which the second penetrated into Iran and settled in the mountains of Luristan, a region that perfectly suited their way of life as nomads and herdsmen.

The invasion of the Scythians took place a little after that of the Cimmerians. They, too, were nomad horsemen of Iranian origin. The discoveries in Iran since the 1930s make it possible to recognize the traces of these invasions and gain a conception of the art of these two peoples so closely connected with the history of Media. Both seem to have left their imprint on the arts of the Median people, whom they helped in their conquest of independence, and contributed to the fall of the Assyrian empire and the disappearance of the kingdom of Urartu.

THE ART OF THE CIMMERIANS AND THE MEDES. *The Luristan bronzes.* The bronzes of Luristan, which made their appearance on the Teheran markets about 1930 and shortly afterward in Europe and America, come from cemeteries in the central part of the Zagros Mountains in western Iran (PLS. 122, 123; I, PL. 437; II, PLS. 5, 6; IX, PL. 497). If the bearers of the civilization that produced the Luristan bronzes were nomads, it is possible that they built dwellings not in the hills, which had been inhabited for thousands of years, but in the plains. They buried their dead in megalithic tombs, outside their living centers, as was done at Tepe Sialk. They had their own religious centers, of which one, at Surkh-i-Dum, has been explored scientifically. The material brought to light there suggests the permanence of the places of worship; in antiquity these continued to be maintained in the same location in spite of profound ethnic and religious changes undergone by the population. It is believed that the new inhabitants of Luristan were Cimmerians, probably related to the Medes, or at least Iranians like them. The identification of a temple that was not part of an agglomeration of dwellings permits the hypothesis that these nomads practiced a kind of amphictyony; in other words, that they formed a community of people who gathered at a religious center, as their descendants, the Lurs, nomads like their ancestors, are doing to this day at Islamic centers of pilgrimage. The Medes seem to have established the same traditions. Their capital, the present Hamadan, before it became a royal city after the formation of their state, was called Hagmatana (the Ecbatana of the Greeks), meaning "place of reunion."

All the peculiarities of the dawning Iranian culture sketched in the preceding section — a culture that may be described as proto-Median — find yet more vigorous expression in the art of Luristan. The existence of cemeteries outside dwelling centers, the megalithic tombs, the abundance of pieces of harness (substitutes for the horse that accompanies death), the use of an identical funerary ware, in pottery or bronze — such are the links between the culture of the Luristan bronzes and

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

those previously mentioned. A marked progress in metalwork, the improvement in weapons, the wealth of art themes — encompassing, besides real and composite animals, the first treatment of myths and legends connected with the primitive religion of the Iranians — tend to classify the culture of Luristan as more recent than that of Tepe Sialk and to date it in the 8th–7th century B.C., a span that might have to be extended at least to the 6th century B.C.

The potters of Luristan, in contrast to those of Khurvin and Hasanlu, applied painted decoration to the type of vessel with a spout open along its whole length and an animal head surmounting the place where the liquid flowed out. The decoration was confined to checkerboards, crosses, and wavy lines, patterns also known to the painters of Tepe Sialk. Animals no longer found a place in the ornamentation of pottery and passed into the domain of metalcraft. They appear as handles on typical jugs of the Tepe Sialk family, serving as guardians or overseers of the liquid.

One vessel in particular, a bronze jug in the Louvre (see Ghirshman, 1954, pl. 9), deserves our attention, for it opens new horizons on the whole civilization of Luristan, on the attribution of that civilization to a specific people, and on its foreign connections. The first peculiarity of the jug is the handle straddling its mouth, as on a basket. More important is the applied relief in the shape of a bearded personage with arms crossed on his chest and two outspread wings; it is attached to the body of the vessel with the help of rivets. A remarkable product of the workshops of Luristan, known for many years, the vase has never attracted the notice of students of applied ornaments on the caldrons of Urartian origin, discovered mainly in Etruscan tombs and likewise bearing bearded and winged personages. The conception of decoration is the same, as is the role these composite beings were called on to play. Of great significance for Iranian art is that a vessel of the same type (Louvre; unpublished) with a similar applied relief was uncovered in the course of French excavations at Ecbatana (mod. Hamadan), the ancient capital of the Medes. These two objects, not to mention other similar ones from the two regions, point to the identity of the art of the Medes and that of Luristan.

The artist of Luristan did not neglect the bronze rhyton, which in his hands took the form of a lion's head with menacing jaw. The eyes are incrusted, and the mane and the folds of the chaps are brought out in repoussé and worked over with a burin. The open jaws served a practical purpose, for, grasped by the upper jaw, the receptacle could be held like a goblet.

Among the bronzes taken from the tombs of Luristan, bits far outnumber other votive objects. Were all the men of Luristan, then, horsemen or charioteers? Possibly, but not necessarily, for the great majority of the bits were found under the heads of skeletons and bear no trace of use. To place a bit under the head of the deceased was to create the illusion that he would make his last journey by means of this substitute for his terrestrial mount. That is the reason why horses, alone or mounted, or yoked as for a chariot — in other words, the man, the chariot, and the team — are the predominant themes on these bits from Luristan, which must be votive objects.

Several dozen varieties of bits displaying the horse can be enumerated. The animal may be very realistic, with a collar and bell; it may consist only of a protoma behind a sphinx whose paws are crushing an animal stretched out on the ground. The artist's imagination spurred him toward ever more exuberant realizations and new schemes of decoration. He came to adorn an animal with parts of other animals, a formula dear to Scythian art. Thus the head of a monster springs from the tip of the wing of a sphinx; elsewhere a long-necked monster grows out of the rear of a sphinx, astride which sits a personage who is fighting the monster.

What may be termed a veritable explosion in the art of the the bronzesmith was an isolated phenomenon in the history of the plastic arts in western Asia. This art was unique in its role as carrier of the diverse themes created in this part of the Asiatic continent. It offers new subjects charged with new meanings linked to the religious beliefs, the mythology, and even the epic treasures of a new people apparently devoid of ethnic bonds with its predecessors in the area. The upsurge of Iranian art on the Plateau makes itself felt in full force in the works of the Luristan bronzesmith.

Weapons were deposited in the tombs in large number. The swords, of iron, bronze, or iron and bronze, are richly decorated; the human face flanks the pommel, and little lions protect the guard. Daggers, maces, whetstone handles, axes, all reflect the prodigal fancy of artists whose main preoccupation must have been to create something new every time — an effort to some extent imposed on them by their cire-perdue technique, which obliged them to destroy every mold.

Among the axes, few could have served the warrior as arms. Their great number makes it difficult to regard them as ceremonial weapons; these, moreover, to judge from Achaemenid monuments, were real weapons. By their form and composition the majority of the pieces — which include true works of art — may be considered symbolic weapons, intended to accompany the dead and serve them in the hereafter. A lion or lion's head apparently became the decoration par excellence of axes. To have the blade issue from the open jaws of a lion was to endow the weapon with the strength of the most powerful of beasts. Numerous indeed are the weapons in which a lion's head spits forth the blade; a lion cub is sometimes stretched along the back of the blade, and the spikes of the socket (see PL. 122) may end in human heads with caps, which are the "miters" worn by the Medes.

However, it is not the form of the weapons that reveals the art of the bronzesmiths of Luristan. All, or almost all, types of axes had long been known in western Asia, some since the 3d millennium; others, particularly those with the blade issuing from an animal's jaws, were used especially in the second half of the 2d millennium. The basic forms persisted with little change, but the bronzesmiths were able to adapt them to a new world full of symbols — perhaps symbols of power, perhaps religious, above all funerary. The study of the Luristan bronzes confirms the striking unity of the traditions behind them and makes it clear that this rich ensemble was dedicated to those who had ceased to live.

Besides weapons, the tombs of Luristan have yielded numerous articles of wear and adornment. In the costume of a people of horsemen the belt played an important role, and a great variety of buckles have been found. The belts consisted of thin plaques of gold or bronze sewn on leather bands and generally decorated in repoussé. Bracelets with ends fashioned into animals or heads of birds perpetuated a tradition already ancient among the peoples of western Asia. There are a certain number of bandeaux to tie the hair, in bronze as well as gold, whose decoration, like that of the belts, may represent the exploits of the owner. Torques, fibulas, and pins have been discovered in considerable quantity. In the employment of torques, also found in the tombs of Tepe Sialk and Khurvin, the new population of the Plateau shows its connections with Nordic peoples. Of the pins, several hundreds of which are dispersed among various collections, some could not have been used for adornment, but, as in Greece, must have had a votive purpose. A pin in the Foroughi Collection in Teheran, with a head consisting of two ibex protomas on which climbs an animal, has a shaft of such length that it prohibits ordinary use.

In works in the round the Luristan founder proved himself a talented animal sculptor, producing, for example, a fine ibex (see Ghirshman, 1954, pl. 4a), a subject found throughout Iranian art. He was less successful, however, when he attempted the human figure. A little bronze statue of a divinity in the Archaeological Museum of Teheran is the only example of its kind from Luristan (see Ghirshman, 1954, pl. 6b). It is flat, being nearly 15 in. high and but slightly over half an inch thick. The eyes, a point of attraction for mountain artists, drew all the sculptor's attention. He took pleasure, too, in dwelling on certain details, especially — as a worthy member of a community of warriors — on the armament: the dagger, which has the length, rather, of a sword, the quiver fastened with two thongs. Very likely the god held bow and arrows in his hands. The inscription, in Akkadian, seems to be of the Neo-Babylonian epoch.

Even less successful are the "orants," manifold tabletlike statuettes, very abundant in Luristan, which permit the surmise that all the dead were accompanied by their doubles, on whom it was incumbent to represent them before the judging divinity. The posture of the statuettes is one of adoration or supplication, most often with arms raised and hands turned frontward (II, PL. 5). It is the gesture of the warrior of Khurvin; the traditions of a Median village and those of Luristan seem to have been the same. The cap with a triple fold of one "orant" recalls the Median headdress.

The most common among the idols of Luristan is a group consisting of three parts, often found separated: (1) the central subject, a tube-shaped personage struggling with two animals between whose hindquarters the lower portion of his body disappears (PL. 122; II, PL. 6); (2) a bell-shaped stand provided with a tube; (3) a pin running through the personage and securing him to the stand. Rare is the personage with a single head. A given idol may have as many as four heads superposed, all stopping at the chin and, whatever the number of heads, invariably double-faced, like Janus. The classic piece consists of a bust with arms stretched out to strangle two monsters with wide-open jaws. Each head forms a triangle extended by two large projecting ears and halved by a prominent nose that cuts the face like a saber blade; the button eyes are emphasized by a circular ridge — the Luristan bronzesmith's usual treatment of eyes. The personage wears a necklace, which sometimes takes the form of a pectoral. At the waist he has a wide belt, with which his body stops, to be replaced below by the rumps and legs of the monsters he fights. From either side of his body projects the head of a cock.

To multiply the effigy of the god was, in the same proportion, to multiply his power and extend his protection over the faithful. The more heads he had, and especially the more eyes, the more clearly manifest were his superhuman attributes, and the more useful could he be to his adherents and the more redoubtable to his enemies. Thus the polycephaly of the idol, each of whose heads, moreover, has two faces, stresses the power of the divinity, as do the enormous eyes and jutting ears. It has been suggested (R. Ghirshman, *Bīchāpour, II: Les Mosaïques sassanides*, Paris, 1956, pp. 125–26) that the multiple-headed idol, which seems to have been among the furnishings of nearly all the tombs opened in Luristan, represents the god Sraosha, one of the most ancient and most important divinities of archaic Mazdean Iran. The cock was one of the attributes of Sraosha, who combated monsters, the enemies of the great god Ahura Mazda (Ormazd) — monsters pictured with terrifying jaws, in which it would be difficult to recognize any particular species of animal. Sraosha was also the great dispenser of justice, before whom everyone was obliged to appear after death; and it was to prove the piety of the defunct and draw on him the divine benevolence at the time of the last judgment that the likeness of the god was placed near him in his last home.

There is no hint of the shamanism that some have thought to detect in the Luristan bronzes. Probably they represent the most ancient images of Iranian devotion, dating from the period when, it seems, the Yashts — the most archaic parts of the sacred book of the Iranians, the Avesta — were formed orally. This identification offers a clearer explanation of the funerary furnishings so abundantly distributed by the living as a last offering to the departed, furnishings that must have been, if not all, at least in large part, closely connected with the funerary symbolism.

The statuettes were symbols that explained to the faithful the nature of the god, his role in the lives of men and after their death, his exploits, his victories, even his accouterment. Art was in the service of religious imagery and in a single piece brought together a multitude of facets characterizing a divine being. Here seems to lie the reason for the astonishing association of so many diverse elements juxtaposed or intertwined, for a composition contrary to nature, for the fantastic evocation of a deity with multiple heads on a cylindrical half-body merging with the rumps and paws of monsters.

Of the greatest interest for the history of archaic Iranian religion is a silver plaque in the Cincinnati Art Museum (PL. 123). The middle is occupied by Zurvan or Eternity, a primitive androgynous deity, shown with two heads, both fullface: that of a man with a long beard and, beneath, that of a woman. A god of the firmament, he has a birdlike body and long wings with three rows of feathers; the trapezoidal tail has six rows of feathers. According to tradition, Zurvan sacrificed for a thousand years to have a son, Ahura Mazda, and had begun to doubt the utility of his sacrifices when the twins Ormazd and Ahriman were born. The first became "the Lord, the Wise" (Ahura Mazda), because Zurvan had sacrificed; the second, the spirit of evil, because he had doubted. On the plaque the twins flank the head of Zurvan.

Zurvan, who expected the birth of Ormazd, had promised the universe to the first-born. Now, Ahriman, having learned of this promise, left his father's bosom first, before his brother. But the father recognized Ormazd, luminous and sweet-smelling, and, giving him the barsom, said to him: "I have sacrificed for you until now; henceforth you will sacrifice for me." The plaque pictures the transfer of the barsom, a bundle of twigs, which in the hands of the artist became a palm leaf — a form taken by the barsom in other works from Luristan, too. Three groups of figures carry barsoms. The youngest, seated on the ground, on the left, support with their hands the barsoms carried by the adult figures advancing toward the left-hand twin, who seizes a stalk. The right-hand twin, making the same gesture, receives a barsom brought to him by a procession of old men. The artist's intention of representing three groups of different ages is clear. According to literary sources, Zurvan was a tetraform being who bore the three additional epithets Ashogar, Frashogar, and Zarogar — names referring to the three phases of terrestrial life. It is plain that in all the figures carrying barsoms the same god Zurvan must be recognized.

As Zurvan was the god of destiny, to whom supplicants could address their petitions, and since, in addition, he controlled the road leading to the Bridge of Chinvat, where the souls of the dead were judged, it is easy to understand why pictures of him as well as of Sraosha were placed in the tombs near the dead, who had to present themselves before the Bridge, that their fate might be decided. The plaque is of great value in confirming that the cult of Zurvan must be considered one of the most ancient in the Iranian religion and that it dates from a period earlier than the teachings of Zoroaster, the great reformer of the Mazdean religion. It would also seem to confirm the hypothesis that this cult was propagated especially in the western portions of Iran and was an old Median religion.

Among the bronze objects that appeared on the markets of Teheran were remains of shields, parts of quivers, and a large number of pins with disk-shaped heads, on which a variety of subjects are treated in repoussé. All the objects are supposed to have come from a sanctuary discovered by peasants and later excavated scientifically under the direction of E. F. Schmidt. Nothing about these objects has reference to, or connects them with, the horse. Very likely they are votive offerings by those seeking the benevolent aid of a deity in the realization of their wishes (see DEVOTIONAL OBJECTS AND IMAGES).

Most of the disks on the pins display a human head in fullface at the center and, like the heads of the idols in which we have proposed to identify the god Sraosha, stops at the chin (PL. 123). The image has been interpreted with some plausibility as that of a divinity. On some disks it is possible to recognize Zurvan and the theme of the birth of the twins — the same subject, but less fully developed, as on the plaque described above. Other disks, depicting a woman in labor, can be interpreted as a prayer addressed to the divinity of procreation (the goddess Ashi, the sister of Sraosha?). On one disk the central face is surrounded by lions, of which the two upper ones share a single head (Paris, Coll. David-Weill; see Ghirshman, 1954, pl. 8b) — the earliest known Iranian version of a motif that was to live in the arts for centuries and have a remarkable propagation among Western medieval artists.

There is in the art of Luristan a note so personal as to suggest that an intrusion must have occurred in the evolution of an art generally believed to be that of one and the same people. Beside scenes that had been, and were to remain, more or less

classic themes in the life of a people for whom warfare and hunting provided a richly suggestive and valued framework, we encounter others — unreal, fleeting, tangled — with a spirit that pierces this calm universe and introduces a breath of anxiety. We sense man preoccupied with an unknown world surrounding him and influencing him at every moment of his earthly existence and destined to play a preeminent role in his afterlife.

The whole rich iconography of the Luristan bronzes — this world of composite beings and their conflicts — reflects beliefs in which we discover both funerary symbolism and traces of the mythology of a people, or rather of tribes, who came laden with their baggage of religion and traditions. Those who left cemeteries with tombs overflowing with bronzes were Aryans. And if we cannot specify as yet to what degree they were Cimmerians or Medes, such a determination does not seem out of reach for science, unless the symbiosis of these peoples was so profound that they can only be considered together — given their common Iranian origin and the quasi identity of their language, traditions, and beliefs.

The art of Luristan is an explosion, a sudden flowering of means of expression and of technical command, in which we cannot detect any long evolutionary process. It betrays no coherent stylistic development marked by a series of creative stages. To be sure, the impulse might have come from the exterior; much is to be said for this explanation, but by itself it is insufficient. It was necessary for a whole people to attain a certain phase in its existence before it could freely pass to so broad a manifestation as that offered by an aggregate of several thousand bronzes of Luristan. This art is unacquainted with the glorification of heroism, but neither does it know brutality; it has nothing of the pathetic but delights in the monstrous and in a refined stylization, material rather than cerebral, in which the call of the ancient Asiatic civilizations is to be felt. It belongs to the period when religious consciousness was closely linked to the awakening of national consciousness, which led the Iranians of the 8th–7th century B.C. to the constitution of a first kingdom, that of the Medes.

The annals of the Assyrian kings of the 8th century, and especially of the 7th, make it possible to establish, with a certain degree of likelihood, the presence of the Cimmerians in Luristan. They disclose that the Cimmerians supported the Medes in their struggle for independence against the Assyrians, but that some among them served as mercenaries in the Assyrian army; these must have taken part in the struggle of King Sennacherib against Babylonia and Elam and participated, in 689 B.C., in the pillage and destruction of Babylon and of a part of the Elamite kingdom. Now, among the objects found in the tombs of Luristan, some twenty are known today — weapons and vases — that bear cuneiform inscriptions with the names of Babylonian and Elamite kings and high dignitaries, most of which date from the last centuries of the 2d millennium. The presence of these objects is the main reason why several scholars moved back the date of the Luristan bronzes to the 2d millennium. However, these objects were not presents given by princes or lords of the plain to the mountaineers in their service. It is more likely that they were deposited as offerings in the Babylonian or Elamite temples and fell into the hands of the Cimmerians during the pillage. It has not been noticed that none of the inscriptions of these bronzes mentions an Assyrian name. The mercenaries treasured them, for an inscribed object is endowed with a magic power and may possess apotropaic virtues for him who owns and preserves it. It is a *maktūb*, a piece of writing, which to this day in the East has lost none of its value.

How are we to explain the flowering of the art of the Iranian bronzesmiths in the 8th–7th century B.C.? No civilization, except perhaps that of the Etruscans, has furnished such a profusion of metal objects, such a great variety of forms, a comparable wealth of subjects treated with such diversity of expression, all testifying to the exceptional gifts of invention of the artists. This center of metalwork arose in a region where nothing appears to have prepared for it or allowed it to be foreseen, in a country which seems not previously to have had, and which was not to have later on, a role of any importance in the political, economic, or artistic life of the Plateau.

One explanation is that in metalwork western Iran was associated with Urartu, in which association it played the role of brilliant second or, according to another opinion, of worthy successor; it is also possible that the two were rivals in their dealings with the Western world. The art of the Urartian civilization is beginning to become better known through the researches of Soviet scholars. Deeply rooted in what the Hurrian world, close kin to Urartu, had achieved on a base of ancient western Asian arts, it had sufficient vitality to inspire the Iranians, who had come to a territory in which artistic traditions were for all practical purposes exhausted or inexistent.

In the same period in the West the Greek Geometric civilization continued to function as a barrier between Mycenaean and archaic culture; nothing comparable is known on the Plateau. Its personality asserted itself from the moment when the Iranians, taking possession of the region, were engulfed in that province of metalworkers which extended from the borders of Elam perhaps to the shores of the Black Sea, amalgamating a large variety of ethnic elements. The Iranians — nomads, horsemen and breeders, mercenaries enriched in the service of the Assyrians, or transporters of goods — had only to choose among artisans, of whom those of what are today Kurdistan and Azerbaijan were so sought after by the Assyrian conqueror that he displaced them in large numbers for his own needs. To these artisans was to fall the task of training the national artists, among whom, if Darius is to be believed, the Medes acquired the reputation we know.

Median art. We are acquainted with Median architecture only through a few rock tombs, which give some idea of a dwelling of the period. Two of these tombs, that in Dukkān-i-Dāūd, near Sar-i-Pul-i-Zuhab, and that near the village of Sakhna, are on the road from Baghdad to Hamadan by way of Kermanshah. Their façades, with a door protected by a projecting roof supported on columns, copy contemporary dwellings. This architecture became traditional in the country.

Of Median art only some funerary reliefs are known. These, however, have considerable importance for an understanding of Achaemenid art, for the chief elements that were to enter into the composition of the sculptured scenes on the tombs of Darius and his successors had appeared on the princely Median tombs.

Until now but one attempt has been made to attribute a known object to Median art: the gold sheath of an *akinakes*, or short Scythian sword, which is part of the "treasure of the Oxus" (Dalton, 1926, pp. 9–11, pl. 9). A more intensive study of this treasure might lead to very important results for our knowledge of pre-Achaemenid Iranian art. It includes several dozen small thin gold plaques with representations, in repoussé or engraved, of figures, some of which hold the barsom, as on certain bronzes of Luristan, and others vases or flowers. These must have been offerings deposited by the faithful in a temple, whence the treasure presumably came. A similar practice apparently prevailed in Luristan, where such plaques, in gold or bronze, depicting praying figures engraved with a burin, have also been found (Teheran, Foroughi Coll.; unpublished). The most securely identified Median objects come from Hamadan, where the French expedition of Fossey and Virolleaud brought to light two bronze vases, in every way like those of Luristan, as well as a dozen small bronze animals, also similar to those of Luristan. That one of these long-spouted vases, already mentioned above, is Median is corroborated by a bas-relief of the stairs leading to the Apadana of Persepolis. While dating is controversial, one may with due caution attribute to Median art of the 8th–7th century B.C. a group of gold and terra-cotta (II, PL. 4) objects uncovered at Kalar Dasht in the central portion of the Elburz Mountains. One piece, a gold cup in the Archaeological Museum of Teheran (VI, PL. 249), offers many similarities to the works of the artists of Luristan. It has a convex bottom and an upper and a lower border in a braid pattern, which frame a suite of three lions with bodies in repoussé and heads in high relief.

THE TREASURE OF ZAWIYEH AND SCYTHIAN ART. The 7th century B.C., one of the most important and least known periods

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

in the history of Iran and its art, has been strikingly illuminated by the fortuitous discovery in 1947 of the treasure (or hoard) of Zawiyeh, whose significance far surpasses all that has been said about it (PLS. 124, 125; VI, PLS. 248, 249). For if the quantity of objects in precious metals and ivory immediately awakened the interest of those who first concerned themselves with it, the historical value of this treasure and the character of its essentially composite art place it among the most astonishing discoveries made in Iran in a half century.

Situated on the border of Azerbaijan and Kurdistan, Zawiyeh near Sakkiz (Saqqiz), is found in that region which in the 8th–7th century was the kingdom of Mannai and which after 650 B.C. was occupied by the Scythians, whose kingdom it seems to have become and whom it served as a base at the time of their dominion over the Medes and of their raids across all western Asia. The treasure of Zawiyeh reflects the peculiarly embroiled political and artistic situation in this part of Iran — one attributable to several factors: the influences and the greed of two great neighboring rival powers, Assyria (see MESOPOTAMIA) and Urartu (q.v.); the national aspirations of the Medes, who had just established their kingdom; the invasions of those peoples of Iranian origin, the Cimmerians and the Scythians (see STEPPES CULTURES), and the latter's seizure of the country; their alliances, now with this people, now with that; finally, the role that could be played by the autochthonous populations, renowned and sought after as artists and artisans.

The major part of the treasure is in the Archaeological Museum of Teheran. Its composition — it consists of a very large number of objects of unequal value — and the presence of fragments of a bronze sarcophagus demonstrate that it comes not from a cache for the shelter of spoils but from the tomb of a powerful Scythian king, buried according to the practices required by Scythian tradition, which, as described with an abundance of detail by Herodotus (IV, 71–72), entailed human sacrifice and the immolation of horses.

To the king let us assign the gold pectorals and torques, as well as the gold sheath for a sword that has disappeared, the gold cuirass, the gold and silver vases, and the furnishings ornamented with sculptured or inlaid ivory. But other objects, such as the numerous gold necklaces, could have belonged only to women; the same is true for the numerous gold earrings and rings and the bracelets whose very dimensions point to a feminine wrist. The treasure includes 44 pins, all of the same shape, but of varying sizes; 4 are of gold, 21 of silver, and 19 of bronze. They would not all have belonged to the one king; the diversity of metals employed would seem to reflect differences in social status among the occupants of the tomb. The fibulas, of which we know 42 — 4 of gold, 38 of silver, nearly all of the same type, without spring — also seem to be an index of rank. So were several hundred small gold objects, bracteates, varying in form and workmanship, some made of very thin gold leaf embedded in a wooden (?) matrix, others ornamented with milling, admirable in execution. They must have been fastened on a variety of garments worn by persons of high rank.

The weapons of gold and silver can be attributed to the king, but the 7 long iron spearheads suggest that the guards were sacrificed. The gold vessels are a royal ware, but the pottery, exceptional in paste and finish, was deposited in the tomb to accompany not the prince but the sacrificed servants; such pottery was always of small scale.

Did the tomb contain horses? It seems more than probable, in view of the presenze of 11 little bronze bells, all of the same workmanship, and a considerable number of gold, silver, bronze, and iron harness pieces. Nor can the hypothesis that a chariot was placed near the deceased be rejected, for broad bronze plaques, decorated with a burin and perforated with holes to accommodate rivets to fasten them, may have been part of the facing of a vehicle, the pole of which ended in a bronze horse's head.

The most important piece is a crescent-shaped gold pectoral meant to be worn around the neck suspended by a chain(?; see Godard, 1950, figs. 15–18, 20–24, 33). It is divided into two registers separated by a torsade and bordered with a frieze of pine cones linked by arcs. Each register has a sacred tree in the middle, toward which converge two processions of composite or real beings, identical on right and left — among them bulls, men-bulls with arms raised in the pose of atlantes, lion-griffins, winged mouflons wearing aprons, sphinxes. The narrow ends of the registers terminate in representations of a feline of very peculiar character, typical of a large number of Scythian objects known from southern Russia, and of a crouching hare, an animal likewise prized by Scythian artists.

Unknown in Assyria and Babylonia, the pectoral is widespread in the civilization of Urartu, and there is no lack of objects, discovered in the territory of this kingdom or its capital, depicting personages wearing this ornament. The half-moon form seems not to have been the only one the Urartians gave the pectoral, for on other works of the same provenance rectangular ones may be seen.

There is every reason to believe that the Scythian prince who was buried at Zawiyeh imitated the Urartian practice. It may also be assumed that the composite beings on the pectoral — originally intended to protect a man's chest — have an apotropaic function. (Whether rectangular or crescent-shaped, the piece in itself as well as in its decoration had this magic value.) The Scythian animals decorating the four extremities also seem to be apotropaic. Thus an object of foreign origin is found introduced into Scythian usage and marked by elements of Scythian animal decoration. The example is not an isolated one; a bronze pectoral has also been discovered at Hasanlu in a Scythian tomb with sacrificed horses.

The hypothesis that the pectoral was a piece of plunder must be rejected; and there is little chance, in spite of the minor character of the Scythian element, that it was a gift from one of the powerful neighbors, who might have had it made for the Scythian prince. It must, then, have been ordered by the prince. The difficulty lies in recognizing the nationality of the artist who executed the jewel. Its themes, to be sure, are as well known in the arts of Assyria as in those of Urartu. But the treatment denotes a hand that, even while reproducing known images, handles them in an unaccustomed fashion. Witness the diversity in the human faces and their non-Oriental cast, which is noticeable in the sphinxes with their pointed noses and in the androcephalous bulls, which, instead of pointed animal ears, have ears forming a double volute. The position of the animals flanking the sacred tree is unexpected, as is the placement of the two genii on the rectangular plaque (very likely from the same workshop), each of whom besprinkles the scorpion tail of a winged lion spitting fire, instead of besprinkling the tree to fecundate it (PL. 124). All this would be surprising in an artist familiar with the iconography of western Asia, and it seems to point to the work of a foreign artist originating in the West, Ionia for example.

What remains certain, however, is that the artist who executed the great pectoral (and the rectangular plaque) strove to satisfy the taste of his Scythian client in composing the decoration by introducing a typically Scythian subject, though he gave it but a modest place at the extremities of the two registers. Here he did exactly what Greek artists were to do on the borders of the Black Sea for their Scythian clientele. For the remainder, he was content to reproduce figures of the imaginary world offered him by the iconography of Oriental art of the 9th–7th century B.C. — an art he came to know by "units" while remaining ignorant of the underlying religious or symbolic values.

The two magnificent bracelets that probably adorned the prince's wrists are composed of five superposed open rings, of which the central one has a sharp edge and the exterior ones broaden out in back to accommodate two pairs of crouching lion cubs (PL. 125). At each end is a lion's head modeled in the round. The treatment of the cubs' heads is close to that of the terminal ones. The ridge that delimits the top of the forehead and encircles the two protuberances serving as ears would indicate a Urartian workshop or one influenced by Urartu.

It is probable that a workshop serving the Scythian prince and treating subjects of Scythian iconography produced a gold band on which two felines appear front to front and the borders

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

are decorated with birds' heads, "all beak," whose eyes were filled with polychrome enamel (see Godard, 1950, fig. 29). That the workshops existed on the spot and catered to Scythian taste is proved by a fragment of very delicate pottery, of exquisite finish, painted purplish red. The Scythian feline of the great pectoral and the gold band is found again as an applied relief on a vessel (see Ghirshman, 1954, pl. 10a). The same animal, probably produced by the same workshop, was cast in solid gold on opposite sides of the chape (Ghirshman, 1954, pl. 10c) of a scabbard, itself entirely covered with saigas' heads viewed from above (Godard, 1950, fig. 44) — another subject of Scythian iconography.

The same Scythian animals that are found in gold — the feline, the hare, the head ("all beak") of the bird of prey — appear incrusted on a silver plate, decorating it with several concentric circles (PL. 124). In this piece, too, we seek to identify the artists who produced the objects described above. Let us recall, however, that the disposition of animals in concentric circles might have been copied from certain Urartian objects, the royal shields for example.

One of the pieces most representative of the "Asiatic" style in Scythian art is a gold belt with perforated edges that probably fastened onto a wide leather band (PL. 125). The decoration consists of series of loops joined by lions' heads to form a lattice, whose spaces are filled with alternate rows of stags and ibexes that probably faced each other in the middle of the belt. The lions' heads are treated exactly like those of the lion cubs on the bracelet, a treatment in which Urartian elements may be recognized. The lattice pattern, too, is known from Urartian objects. But the crouching stags are handled here according to the purest traditions of Scythian art of the 6th century B.C., as it is known to us from objects discovered in the most ancient Scythian tombs in southern Russia (VI, PL. 463). The head is stretched forward; the muzzle has a double slope with a ridge along the middle; the ear, cradled in the hollow of the neck, is pointed, as are the superposed hoofs. The shoulder is indicated by an oval bulge, a technique employed by artists of western Asia, and the neck, the body, and the well-developed antlers lying along the back present a double slope with a central longitudinal ridge. The same treatment of surfaces is observable in the ibexes with pricked-up ears. Horns, neck, body, and feet consist of planes meeting in sharp edges. To the Scythian repertory so far identified must be added the stag, preeminently a Scythian animal.

The belt was an attribute of power for that son of Herakles, the Scythian, and, like the cuirass, had a defensive purpose. Endowed with magic properties, it was a part of both masculine and feminine attire. Although no belt so wide as that of Zawiyeh seems to have been found in the Scythian tombs of southern Russia, such belts are known among the bronzes of Luristan and Urartian finds.

From what appears to have been an impressive group of vases in precious metals deposited in the princely tomb, there remain only a few fragments; from these one may attempt to determine, at least in part, what these rich offerings represented. The most important piece, both artistically and as a funerary object, must have been a gold caldron that has disappeared, except for the decoration consisting of two lions, also of gold. From similarities with the protomas of two griffins and two lions on a bronze caldron, probably of Urartian origin, found in the Etruscan Barberini tomb (X, PL. 402; in the Museo di Villa Giulia in Rome) — and from the character, the tension that the artist managed to impart to these beasts, from their very posture, with front members projected forward — it can be deduced that the four animals of Zawiyeh were part of a like caldron, probably melted down by the peasants who discovered the tomb. The ferocious appearance of the lion and the menacing beak of the griffin (PL. 125), as well as the forepaws of these beasts, express the idea of protecting the object on which they were fastened and whose contents they were supposed to guard or defend. The same tradition may be observed in the plastic decoration of proto-Median and Median vases.

The treatment of the griffin has nothing Assyrian about it. On Iranian soil its iconography exists in the bronzes of Luristan, among which it even appears with a three-part crest. The bird's head with a "visor," a peculiarity that might have been thought a Scythian creation, is also encountered in Luristan. If the protomas do not show any bond with Assyrian art, neither do they seem to come from the workshops that produced the objects marked by elements of Scythian art. More likely they are of Urartian workmanship — this for three reasons: (1) the griffin's eye, which was certainly incrusted, is treated exactly like that of the bull in the Urartian relief of Adelyevas, rightly believed to have been inspired by a metal object (H. T. Bossert, *Altanatolien*, Berlin, 1942, no. 1192 and p. 91); (2) in Asia only the winged bronze griffins of Toprak Kale (Urartu) and the ivory man-griffin of the same site are furnished with a double braid forming a spiral; (3) it is also in Urartian art that we find the "visor" covering the griffin's beak.

Surely there was at least one chariot in the tomb. The bronze horse's head rising on a long forward-curving neck, which must have decorated the tip of a chariot pole, should remove all doubt on this subject. The use of such an ornament is attested by representations on Assyrian monuments; to judge from the famous mosaic in Naples (Mus. Naz.), a panther was affixed to the pole of Darius III's chariot at the Battle of Issus. The bronze head from Zawiyeh is the first object of its kind found on western Asian soil. Heavy and massive, it was cast in two sections, the head and the neck. The eyes are indicated by a lozenge-shaped frame in relief, cut in the middle by a line, also in relief; the same technique is used for the nostrils; the modeled ears are heart-shaped like those of the previously described Scythian feline. The work appears Urartian in the manner of handling the eye, which is similar to the technique of the founder who cast the bull on the Urartian bronze caldron found in the Heraion of Argos.

A rich selection of objects in carved and engraved ivory accompanied the Scythian prince into his tomb. At least four different techniques, perhaps reflecting different provenances, are distinguishable. The most important group and the one that, judging from workmanship and dimensions, seems to have been the most sumptuous, constituted the ornamentation of a large object (a throne or a ceremonial bed?), probably of Assyrian origin. The plaques of this group depict scenes of hunting, by chariot, on horseback, and on foot (see Godard, 1950, figs. 83–86). A very peculiar technique of massive incrustation on small ivory plaques marks a few rare surviving pieces. This taste recalls what is known from the arts of Urartu, where so many composite animals and even personages in bronze received incrustations. With some reason, perhaps, an attempt will be made to attribute to a local school the work on a piece of furniture (?) made of ivory. The scene depicted imitates the one Esarhaddon had executed for his palace of Nimrud after the treaty concluded with the Median chief Ramateia. It consists of a series of outlined personages, decorated with simple incisions, who advance toward a chief, of larger dimensions. Finally, a very thick plaque from a casket (?) would seem to be of foreign inspiration but very rudimentary local execution (see Godard, 1950, fig. 91). The representation appears to commemorate an agreement or treaty concluded between two princes. Behind the one on the left a courtier holds a parasol, as was the rule at the Assyrian court; the one on the right is followed by his squire, who holds bow and arrows, the symbols of power par excellence among Iranian peoples. On the left a man sacrifices a bull as a thank offering.

The art of the funerary furnishings in the princely Scythian tomb of Zawiyeh — certain aspects of which are elusive — offers a lesson that can hardly be elucidated in all its complexity. Despite the discovery of new texts that illuminate some notable historical facts, our knowledge of the period bears chiefly on the roles of the great powers, Assyria and Babylonia, less on that of Urartu, little on that of the Medo-Scythians. Now, it was these last who apparently played the preponderant part in the collapse of Assyria and Urartu, as the Persians were to do, less than a century later, in the fall of Babylon.

The funerary furnishings of Zawiyeh, and particularly the pottery, demonstrate that just as the Scythians and Cimmerians drew on Median civilization, so this civilization drew on the culture

of the Scythians and Cimmerians. Certain later monuments, such as the bas-reliefs of Persepolis, induced as keen a mind as Herzfeld's to defend the thesis of mutual dependence, one that now seems confirmed. The diversity of artistic currents crossing in this group of objects reflects the tumultuous role of the Scythians in western Asia in the 8th century B.C. It presages what Iranian art was to become under the Achaemenids, and it doubtless sheds light on the character of Median art.

The appearance of the Scythians west of the Volga took place, according to Soviet archaeologists, about 1000–900 B.C. Their movement did not stop after they had reached the plains north of the Caucasus; their traces have been recognized in the Caucasus and Transcaucasia as early as the 8th century and perhaps even before. There, under pressure from the kingdom of Urartu, they seem to have formed a confederation that, reinforced by a new wave from southern Russia, in the 7th century invaded the regions south of Transcaucasia. From that period onward their career is partly known, thanks to the ancient historians and Assyrian sources. They were at first allied with the Medes, at the time of the great revolt of this people against the Assyrians. Then they changed sides and, maneuvering in the orbit of Assyrian power, established themselves south of Lake Urmia, in what is now Kurdistan, where they created their kingdom. Thence they extended their dominion over the Medes and undertook ravaging forays into various parts of western Asia. The fall of Assyria (612 B.C.) and the rise of Median power marked their withdrawal, and if some of the repelled Scythians remained confined in Transcaucasia, the majority must have crossed the Caucasus once more and extended their hegemony over southern Russia during the first decades of the 6th century.

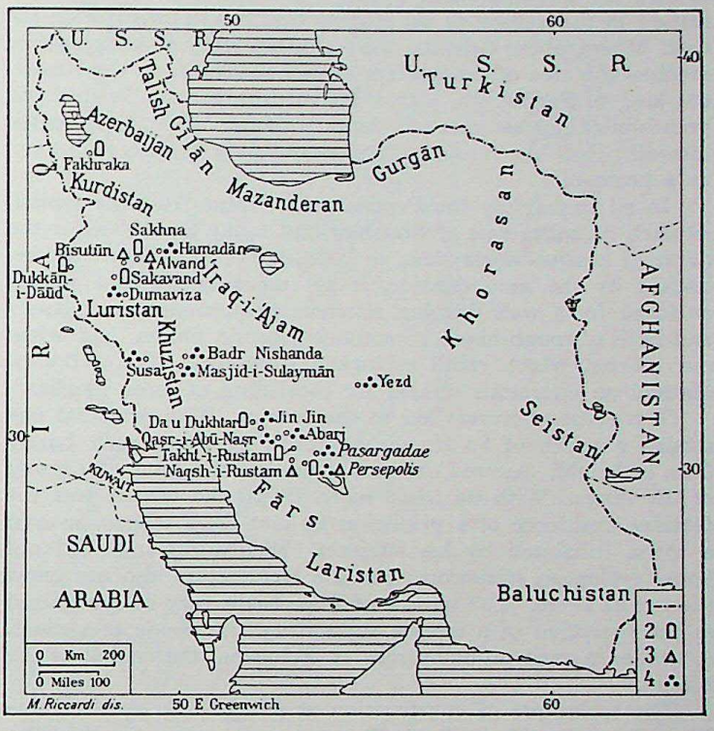
The Scythians, then, passed through four phases, associated with the following regions: (1) those north of the Caucasus; (2) Transcaucasia; (3) Kurdistan; and, finally, (4) the Kuban region, north of the Caucasus, on the lower Dnieper.

The best-known Scythian art was that o the last phase. The tumulus tombs of Kelermes and of Kostromskaya Stanitsa in the Kuban, and the Litoy kurgan on the Dnieper are the most ancient tombs but probably do not date back further than 580–570. Scythian animal art of this period has a well-established iconography; it features the stag, the feline whose paws, ears, and eyes are shown by means of circles, the head of a bird of prey, the curled-up feline. The source of this art seems to be a religious one, impregnated with totemism and animist ideas. The technique of representation has the tendency to decompose the animal's body into a set of planes joined at an angle — a survival from objects carved in wood, bone, or horn.

Side by side with these specifically Scythian designs, often on the very same object, there appear images deriving from the iconography of the arts of western Asia, for example, animals in a heraldic pose or hybrid creatures. The execution often reveals the hand of Greek artists working for a Scythian clientele. It has been proposed to attribute to the first and most ancient known phase of Scythian art some objects found near Kerch, on which can be recognized the head of the bird of prey and the feline, sculptured in bone; these figures of Scythian iconography would presuppose a long evolution.

The sojourn of the Scythians in Transcaucasia is known mainly through tombs containing human and equine sacrifices. The Soviet excavations of Karmir Blur, a Urartian fortress north of the Araks River, have revealed numerous remains of Scythian objects, arms and harness, and archaeologists have been able to observe the role of Urartu in the formation of Scythian culture and art.

The tomb of Zawiyeh offers a picture of Scythian art in its third or "Asiatic" phase. The bronze sarcophagus seems to be Babylonian or Assyrian; the use of the pectoral comes from Urartu; certain jewels, such as the rings with four-petaled flowers, are close to those of the Artemisions of Ephesus and Delphi — which suggests that the jewelers who executed them were acquainted with Greek products. The link between Scythian art and that of Luristan has yet to be thoroughly studied, but the connections between them cannot be denied. The same workmanship has been recognized in the horse's heads produced by the two cultures; in the stag of Kostromskaya and that of Luristan, with its antlers resting on its back and its superposed pointed hoofs. The bits of Luristan show the so-called "zoomorphic juncture" dear to Scythian art, where the body of an animal represented whole is charged with parts of another animal, especially heads. Did not the small animals that form the bodies of large animals in Luristan serve, later on, as a point of departure for the creations of Scythian art? The iconography of Zawiyeh is enriched by such a composition as two lions with a single head, which appears on certain objects from Luristan. The iron dagger of Zawiyeh with a guard flanked by two little



Distribution of the most important pre-Achaemenid and Achaemenid monuments in Iran. *Key*: (1) Modern national borders; (2) rock tombs of the Medes(?) and the Achaemenids; (3) Achaemenid rock reliefs and inscriptions; (4) remains of Achaemenid edifices and architectural complexes.

lions is but a replica of the iron sword of Luristan. The Zawiyeh pottery in its forms and decorations illustrates the eclectic character of this phase of Scythian art; with the long-spouted pitcher it carries on the Median traditions of Tepe Sialk, Khurvin, Hasanlu, and Luristan.

Scythian art remained, and was to remain, profoundly attached to its subjects — the stag, the feline, the bird's head — which were perhaps the patrimony of all peoples who, like the Scythians during their beginnings, wandered over the vast stretches of Eurasia. And when the Scythians arrived on the soil of western Asia, they enriched their art with what the Irano-Urartian idiom had to offer them. The art of Urartu and that of Luristan appear as the most important components of Scythian art, and also as the most profoundly pervasive — more so, it seems, than Assyrian art, whose products swell the funerary array at Zawiyeh.

The encounter of Scythian art with that of western Asia occurred on western Asian soil; through Urartu and Luristan Scythian art also inherited the artistic traditions of the ancient Asiatic civilizations, those of Mesopotamia, Syria, and Asia Minor. On this soil archaic Scythian art, which in the beginning knew only very modest materials such as bone, wood, and horn, was able to select precious metals; for the Scythians acquired prodigious wealth by pillage and conquests that pushed them as far as the frontiers of Egypt. The taste for luxury and polychromy, once acquired, survived even after their return to the plains of southern Russia. But their art remained an applied art, an art of nomads.

Scythian art had a further role. Conditions were favorable for the creation of a close union between Scythian art and that

of the Medes and Cimmerians — Iranians, like the Scythians, and like them inclined to a theriomorphic conception of the world. Thus, one may conclude, did artistic expression of the Plateau acquire unity, a unity that was to survive in Achaemenid art, with which the Scythian, enriched by Greek art in the Pontus, was not to break its bonds.

ACHAEMENID ART. *Civil architecture.* The Persians, whose presence to the south and southwest of Lake Urmia is mentioned by the Assyrian annals of 834 B.C., must have continued to move toward the southeast and by the 8th century must have been settled in the valleys of the Zagros that border Susiana on the east. When, about 640 B.C., the victorious army of Ashurbanipal reached the area of the modern city of Shushtar, on the Karun, the king of Parsumash, Cyrus I (Kurush), son of Teispes and grandson of Achaemenes (the founder of the dynasty), presented himself before the Assyrian general and gave him his eldest son as a hostage.

In all probability the Persian prince came from his capital, situated 25 miles east of Shushtar and today known under the name of Masjid-i-Sulaymān, or "Mosque of Solomon." There, backed by the mountainside, is an imposing artificial terrace enclosed by a wall forming alternate projections and recesses and built of rough-hewn, sometimes gigantic blocks, laid without mortar, which recall cyclopean stonework. The wall constituted an enormous caisson for the filling of loose blocks.

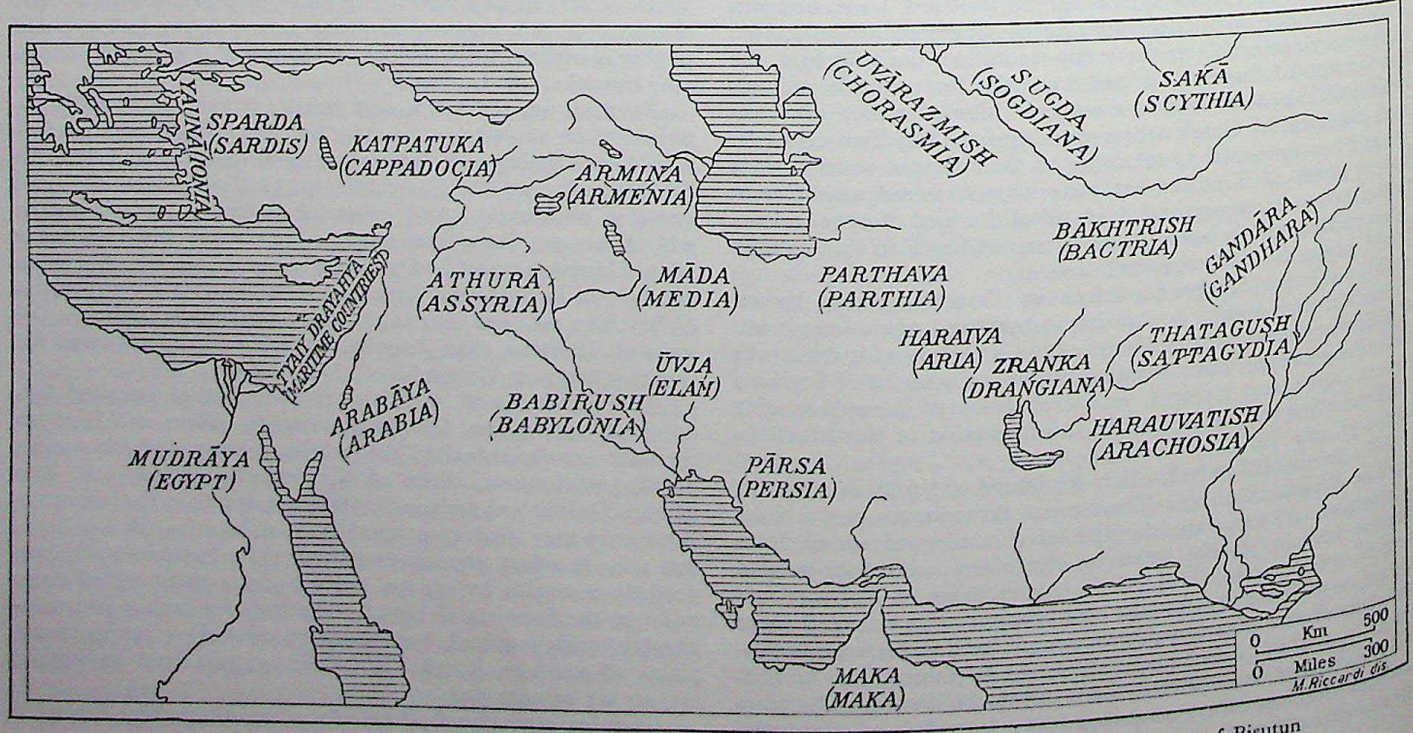
Ten stone staircases led to the terrace. The principal one attains a width of 80 ft. and numbers 25 steps, each barely 6 in. in height. Around the terrace emerge the ruins of a group of dwellings. With its triple liwan (*īvān*) the terrace was the fortified residence of a prince; at its foot lay a village, or even a town, inhabited by his subjects. Prehistoric Iran did not know cyclopean stonework; Elamite architecture did not know the use of stone. The terrace of Tepe Sialk may be recognized as the inception of a terrace supporting the abode of a chief. A similar terrace probably rose at Ecbatana, the capital of the Medes.

The technique of construction at Masjid-i-Sulaymān came from afar, very likely from Transcaucasia, which in the first centuries of the 1st millennium had numerous fortified towns employing cyclopean stonework — the prevailing technique in Urartian military architecture. The people who erected this terrace in a barren valley of southwestern Iran could have arrived at their mode of construction only after a sojourn in the neighboring regions of Urartu; and the fact that they gave their new country the name of Parsumash identifies them as Persians.

A Persian community also settled in Susa in the late 8th or early 7th century. The architecture of this village indicates a transition between the nomadic and the sedentary life of the people. Its art is marked by a great modesty, but it includes painted pottery, abandoned by the Elamite people of Susa for centuries. Some of the pieces, among them a horse-shaped receptacle (II, PL. 3), belong to the family of works due to the proto-Median potters of the Plateau, of Tepe Sialk in particular; and this speaks for the presence of Iranians among the inhabitants of the village.

The terrace of Masjid-i-Sulaymān could even have been built by Achaemenes (ca. 700-675); in all likelihood it existed under his son Teispes (ca. 675–640), who extended his possessions over Parsa, or at least over part of the future province of Persis. At his death Teispes divided his kingdom, probably still in vassalage to Elam, between his two sons. Cyrus I (ca. 640–600) inherited Parsumash, apparently with Masjid-i-Sulaymān as capital, while his brother Ariaramnes (ca. 640–615), representing the younger branch of the dynasty, became king of Parsa. Cyrus I was succeeded by Cambyses I (ca. 600–559) who must have brought about the unification of the kingdom by dethroning Arsames (ca. 61 5–?), son of Ariaramnes, father of Hystaspes and grandfather of Darius the Great. Cyrus the Great, son of Cambyses I, on his accession, became king of united Parsumash and Parsa but had to recognize the suzerainty of Media.

Was the transfer of the Persian capital from Masjid-i-Sulaymān to Pasargadae, near the Pulvar River, effected by Cyrus the Great or earlier by his father? The second hypothesis seems more credible. The unification of the kingdom might have suggested to its ruler, Cambyses I, that he establish himself in a far richer region than Masjid-i-Sulaymān and one more central in relation to the Persian tribes that swarmed over southwestern Iran and the area south of the great central desert, in the direction of Kerman. Two other arguments may be brought forward in support of the second hypothesis. (1) There is a royal tomb, Da u Dukhtar, hewn out of the rock on the road that must have connected Masjid-i-Sulaymān with Pasargadae. In its conception and façade it occupies a position between the royal Median rock tombs mentioned earlier and those created by Darius the Great at Naqsh-i-Rustam; its attribution to Cambyses I seems plausible. (2) This hypothesis makes it easier to understand the difference in the architecture of Pasar-



The Achaemenid empire under Darius the Great (521–486 B.C.) and the provinces according to the inscription of Bisutun

gadae itself between the treatment of the stone in the terrace, known as Takht-i-Madar-i-Sulaymān ("Throne of the Mother of Solomon"), on the one hand, and that in the "imperial" buildings erected by Cyrus the Great in the plain, on the other.

Built against an advanced spur, this terrace was conceived according to the same general plan as that of Masjid-i-Sulaymān. The posterior portion of both terraces consisted of a flattened rock prolonged by an artificial structure composed of a mass of rubble, which at Pasargadae was held in by a wall carefully constructed of roughly dressed blocks forming bosses and grooves. This technique of cutting the blocks was new in Iran. It was known in imperial Hittite architecture but disappeared after the fall of the empire, not to be seen again in Asia Minor until the advent of the Phrygians; it was widely developed by the Urartians, whom the Persians very likely imitated. The surface of the terrace has yet to be methodically and scientifically explored; buildings of unbaked brick and wood constituting the prince's residence must have stood there, while the dwellings of the city spread below, west of the mountain. Stone palaces, adorned with sculptures subordinated to the architecture, were not erected until after the victory of Cyrus the Great over Astyages, the last Median king, in 550 B.C., when the Achaemenid became master of the Medo-Persian kingdom. From the fortified dwelling of a vassal prince, Pasargadae became the capital of an empire.

Pasargadae, whose ancient name seems to have been Parsa-gada, signifying "Camp of the Persians," fully justifies that appellation by its plan. Its complex covered almost 1½ miles in length and included palaces, a temple, and the tomb of the "king of kings" (PL. 126), on a surface covered with vegetation and irrigated by canals (FIG. 270). It was the capital of an empire whose sovereign people, changing from a nomadic to a sedentary life, conceived the royal city as a camp materialized in stone. The quarter where the palaces stood, which was enclosed by a wall, had a monumental entrance that formed a hall with two rows of four columns and large doorways flanked by enormous winged bulls. Of the narrower doorways a single jamb is preserved. It is adorned with a bas-relief representing a four-winged genius in a long garment of Elamite type, whose head is surmounted by a complicated headdress of Egyptian origin (PL. 127). In the early 19th century an inscription over the figure could still be deciphered: "I, Cyrus, king, the Achaemenid [have done this]."

About 220 yd. from the monumental entrance stood the Audience Hall, its smooth white columns placed on square bases of black stone, whose capitals, also of black stone, were in the form of protomas of bulls, lions, horned lions, and horses. The door frames still preserve remains of bas-reliefs representing genii, men-fish, and men-bulls.

Some 270 yd. north of the Audience Hall rose another palace, whose roof was also supported by white columns on black stone bases. This bichromy survives likewise in the black and white slabs of the back wall of a portico and the pavement. The central hall, flanked by two porticoes, had two large doors framed by bas-reliefs showing the king followed by a parasol bearer. Here for the first time on an Iranian sculpture appear garments with folds, in contrast to the straight-falling robe of the four-winged genius, executed according to the traditions of ancient Oriental art, which did not endow cloth with the slightest movement or life. True, the royal robes of Pasargadae are somewhat stiffer than those of Persepolis; the relief is too abrupt; the widely spaced folds have a calculated rigidity. But Achaemenid art here marks a first step in the exploration of a means of expression that was to be developed by the artists of Persepolis.

The palace must have been intended for receptions, or for the banquets that would have followed audiences, rather than for residence, as has been suggested, and, thus, Pasargadae prefigures the triple articulation of edifices of the time of Darius the Great on the terrace of Persepolis, with the monumental gateway, the Apadana, and the palace reserved for banquets.

The plan of the palace was to remain unique in Achaemenid architecture and was not to be reproduced at either Susa or Persepolis. It recalls the vast tents in which the great lords of Iran, less than a third of a century earlier, received their guests. Open on the two long sides, they offered shelter, depending on the hour of the day, under one or the other of the two awnings facing in opposite directions.

At the southern end of the site, nearly a mile from the reception hall, is the Tomb of Cyrus (PL. 126). The monument is made of a fine white limestone. The funerary chamber, which recalls a Nordic dwelling, has a low opening and a roof with

a double slope. It is placed on a stereobate consisting of six steps of different heights. The whole structure with its seven "stories" might have been inspired by a ziggurat.

Even after the transfer of the capital under Darius, Pasargadae was never abandoned and remained a religious capital, where the new kings were crowned. An image of the national culture, the city was a vast manifestation of a Persian art the beginnings of which are obscure but which here reveals a character of its own. The terrace, the plans of the palaces, the tomb of the great monarch, the sensitivity to the play of color evinced in the alternation of black and white stones — all these constitute original, if perhaps not entirely independent, achievements, to which Median art was doubtless no stranger. However composite, this art knew how to dominate, recast, transpose, and bal

UP State Museum, Lucknow

ance Assyrian, Babylonian, and Egyptian elements, to fashion a new art, striking especially in its architectonic charatcer.

The architects of Persepolis were to learn a great deal from Cyrus' accomplishments at Pasargadae — from the disposition of the principal buildings and the use of the column, whether of stone or of wood embellished with lively colors; from the use of the orthostat; and from the advance in the representation of the human figure with the introduction of drapery folds. It is tempting to believe that the art of Persepolis was born in the valley of the Pulvar. Concentrated on a more restricted surface than at Pasargadae and confined, according to an old tradition, to a terrace, this art comprised what had already been infused by the Iranian spirit and was spread by Cyrus over a large area.

For an empire such as that of Darius, which spread from Egypt to the Indus and from the Danube to the Jaxartes, a capital in a little valley of the Plateau was not sufficiently central. The king decided to establish his political, diplomatic, and administrative capital at Susa. The Elamite city, severely tried by Ashurbanipal's pillaging army about 640 B.C., was at that time situated less than 60 miles from the Persian Gulf, from which two maritime routes led to India and Egypt. Three land routes connected the city with Babylon, Ecbatana, and Persepolis.

A citadel was erected on the Elamite acropolis; north of it, the royal palace, and south of that, the city itself. These three sections were surrounded by a powerful wall and a moat, into which was diverted the small river Chahur. The palace with its Audience Hall, the Apadana, rose on a terrace, as at Masjid-i-Sulaymān or, in the beginning, at Pasargadae. In a region where stone was lacking, it was on a terrace of thick walls of unbaked brick, serving as caissons, between which enormous quantities of gravel were poured, that Darius erected his residence. The palace followed the plan of Babylonian edifices, adopted in hot countries, with three large interior courts, around which were disposed reception and living rooms. To the north, touching the palace, was the Apadana, in which we recognize the architectural principle already elaborated at Pasargadae, with, at Susa, the central hall surrounded by three porticoes. The roof was supported by 72 columns about 65 ft. high, surmounted by capitals with two protomas of bulls. Like the Audience Hall at Pasargadae, the Apadana was put under the protection of benevolent genii — winged lion-griffins, winged bulls, heads of horned lions with stylized manes — all in glazed brick. To these traditional themes Darius added his royal guard (PL. 127; IV, PL. 21), the Immortals who had been with him in Egypt at the time of Cambyses II's conquest of that country and who, in all likelihood, helped him subsequently to reconquer his throne.

An inscription of Artaxerxes II proclaims that the palace of Susa burned under his grandfather Artaxerxes I and that it was he himself who rebuilt it. Darius' palace, then, remained uninhabitable for several decades. Now, a capital of the importance of Susa could not be left without a royal residence, and, as a matter of fact, a "miniature" palace was erected at the southern edge of the city, under Artaxerxes I and Darius II, in which a small hypostyle hall replacing the Apadana adjoined a reception hall that led to the living quarters. All the fragments of stone bas-reliefs found at Susa come from this little palace. Its decorative program was not new — lion-griffins, winged lions, the Immortals, servants bringing fish for a banquet. But the sculptor's art was no longer the same as in the reliefs of Persepolis; it became more delicate, more humanized. Can it be that a breath from Athens touched the vast plain of Susiana, inspiring the sculptor to impart a vigorous realism to the menacing lion, greater verisimilitude to the more abundant drapery folds and a more graceful movement to the gesture of the servant who bears the cup with a duck's head? With regard to the presumed changelessness of Achaemenid art in the two centuries of its existence, these few mutilated fragments bring valuable testimony, suggesting that after Pasargadae and Persepolis Achaemenid sculpture passed through a third stage.

Without abandoning Pasargadae, Darius built Persepolis, a new capital about 40 miles southwest of it (PL. 131). Once more the architects of the Great King, maintaining the tradition, constructed a mighty terrace with enormous, admirably polished polygonal blocks. As at Pasargadae and Masjid-i-Sulaymān, they propped it against a mountain, a projecting portion of which was leveled and artificially elongated. On this terrace they erected the finest buildings Asia had known until that period.

This capital was not like the ones that preceded it; it was neither a diplomatic nor an administrative center. A statesman of genius, Darius conceived it as a symbol of imperial unity. Every year, on New Year's Day, the beginning of spring, he inaugurated magnificent ceremonies around the terrace to consecrate the unity of the state. Under the aegis of the great god Ahura Mazda, and in the presence of the Great King, the master peoples, Persians and Medes, witnessed the procession of all the nations composing the immense empire as they deposited gifts and offerings at the foot of the throne in token of fidelity and loyalty.

The building of Persepolis followed the plan preestablished by Darius; what was accomplished after him was not due to the initiative of a Xerxes or an Artaxerxes I. The plan and the decoration of the buildings were anticipated, calculated, and studied by Darius; his successors, who had their names engraved on the monuments, were no more than executors of Darius' directives. Herein lies the basic reason for the quasi immobility imputed to official Achaemenid art. This art was supposed to capture the spectator by its symbolism and convey a sense of grandeur; artistic values were relegated to second place. The artistic program of the Great King was Persian, and what scholars seek to attribute to Greek inspiration — if indeed it existed — are factors of minor importance. The example of Xerxes, who imported works of art from Athens, was imitated on a larger scale by the Romans, who were enamored of the works of Greek artists. Iran remained indifferent to Greek beauty and taste. The kings who succeeded Xerxes still imported Hellenic statues — witness the fine *Penelope* of Parian marble found in the Treasury of Persepolis (Teheran, Archaeol. Mus.; see Ghirshman, 1954, pl. 22a); but their official art bears no trace of that esthetic preoccupation manifested by the Romans. It is probable that the intrinsic value of an object — a granite cup of Ashurbanipal, vases of precious metals — stirred greater interest than its artistic value. Here the Persians display the same propensities as the Scythians, their close relatives. Their sort of enjoyment is very different from that of the Romans.

All the edifices of the terrace of Persepolis were built, arranged, and adorned with reliefs in accordance with the role each was called on to play in the great ceremonies of New Year's Day. An attempt to reconstruct this feast in its relation to each of the palaces follows.

The Apadana, similar in plan and dimensions to those of the Apadana of Susa, was reserved for the audiences the Great King gave the Persian and Median lords (PL. 131). The two monumental staircases that led to it from the esplanade were decorated in bas-reliefs representing, among other subjects, the delegations of the 23 nations bringing gifts to the sovereign. The Susians offered weapons and lions; the Armenians, metal vases and horses; the Babylonians, cups, embroidered cloths, and buffaloes; the Lydians, metalworkers of renown, their products and horses; etc. All the reliefs were painted. It is certain that not everyone went up on the terrace. The decoration told the king's guests what spectacle they would see; it was aimed at the onlookers surrounding the king, who from the top of the terrace followed the procession that unrolled at their feet, in the plain. The narrative value of this sculpture completed its decorative value.

Once the procession was over, the king, surrounded by Persians and Medes, moved to the Tripylon (Council Hall), a small building with three entrances. Those of the north and south show the king followed by a parasol bearer and a fly-whisk bearer. On the north stairway can be seen long rows of his guests from Media and Persia (PL. 132). The little south staircase, decorated with servants bearing dishes, indicates that the whole company moved on to the banquet that must

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

have been held in the little palace building that lies south of the Apadana.

The feast terminated, the king and his retinue came back to the Tripylon, passing through its eastern door, whose reliefs show Darius seated on his throne, borne by 28 subject nations (PL. 135). A similar decoration adorns the south doors of the Throne Hall ("Hundred Column Hall") — a circumstance that permits us to deduce the direction next taken by the procession. In this hall the king, seated on a throne, received the representatives of all the delegations, who deposited at his feet the most precious gifts. In fact, the decoration of the north doors, through which these men passed, shows the king and, before him, what we may interpret as an usher of ambassadors (PL. 134).

The Apadana, begun under Darius, was not finished until Xerxes' reign, and the Throne Hall, until that of Artaxerxes I, more than half a century later. Now, two bas-reliefs of Darius, nearly identical to those of the north doors of the Throne Hall (cf. PLS. 133 and 134), have been brought to light in the central portion of what the American expedition that explored Persepolis denominated the "Treasury," a complex of three buildings, very different in plan. That reliefs with audience scenes, of very large dimensions, should have been placed in a treasury surprised the excavators. Their emplacement before the entrance of a hall with 99 painted wooden columns suggests that in Darius' time this hall was the provisional throne room, used until the actual one could be completed. It may be supposed that under Darius the procession in the plain passed the south face of the terrace — a hypothesis supported by the fact that Darius' inscriptions are likewise carved on the south face.

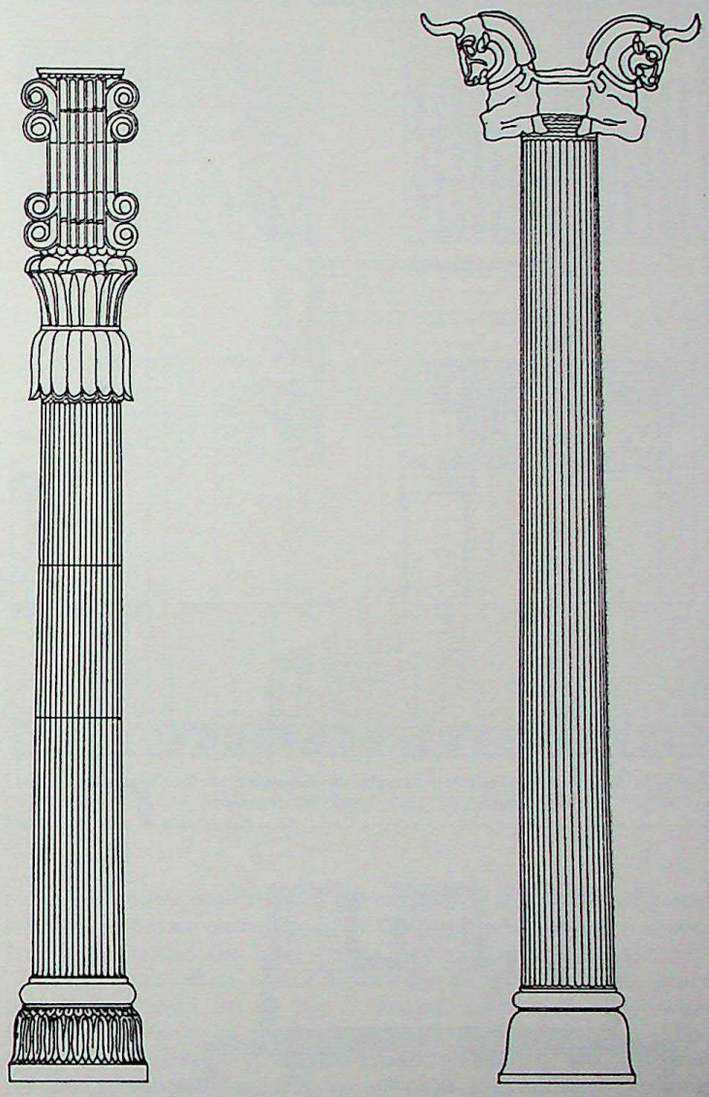
The column (FIG. 274) is the most original architectural element at Persepolis. At Susa it was crowned by bulls alone. At Persepolis the royal architects created four different types of capitals: bulls and, in addition, horned lions, human-headed bulls, which also existed in the palace of Ecbatana (PL. 128), and griffins. Each variety must have been an allusion to the interrelationship among the buildings, in the same way as the reliefs were.

The elements of Persian architecture should not be regarded, however, as exclusively Iranian realizations. On the contrary, it is clear that the use of glazed bricks continued Elamite and Babylonian traditions; that the molding used around doors and recesses, the gorge, came from Egypt, to which country the origin of the hypostyle hall is sometimes attributed, too; and that the idea of fluting was taken from Ionia. The Iranian terrace and its stonework (at Masjid-i-Sulaymān, Pasargadae, and Persepolis) came from Urartu; and unless the plans of the palaces at Persepolis are enlarged versions of the dwellings of northern Iran, they, too, are probably of Urartian origin.

Always highly responsive and receptive to ideas from abroad, Iranian art in this period more than in any other is remarkable for its felicitous employment of forms of foreign origin. The harmony and unity of what may be called the Achaemenid architectural style testify to the success with which its constituent elements are controlled and subordinated. In the adaptation of foreign elements Parthian artists achieved far less satisfying results than their predecessors.

To be sure, Achaemenid monumental art cannot escape the criticism that it remained nearly invariable in technique, that it did not explore plastic expression, that it did not rise to the creation of a third dimension, that it was unable to wean itself from the law of isocephaly, that it did not progress beyond the stage of presentation strictly in profile, that it did not form groups in any other way than by spacing the members. One must conclude that, following its initial conception, Persian art, which reigned alone in the palaces of the terrace, had to preserve this archaism, this frozen severity of expression, as the only elements considered worthy of being maintained by tradition.

Funerary monuments. Darius, returning to the ancient traditions, had his tomb excavated in the steep cliff of Naqsh-i-Rustam, 3 $^{3}/_{4}$ miles from Persepolis (PL. 136; FIG. 275). Three of his successors built tombs next to his, while later Achaemenid kings were buried in the mountain behind the terrace of Persepolis. The tombs of Naqsh-i-Rustam, all built on the same model, are 74 ft. high. The central portion of the façade, with its four engaged columns, imitates the façade of a palace. In the upper portion, on a throne supported by 28 nations, is the king before an altar, over which is a bust of Ahura Mazda in a winged disk. Just as the central portion recalls the Median



Persepolis, two types of column (*from Ghirshman, 1954*).

rock tombs, the scene on the upper portion recalls the relief that surmounts the Medo-Scythian tomb of Kizkapan (Qyzqapan) in Iraqi Kurdistan.

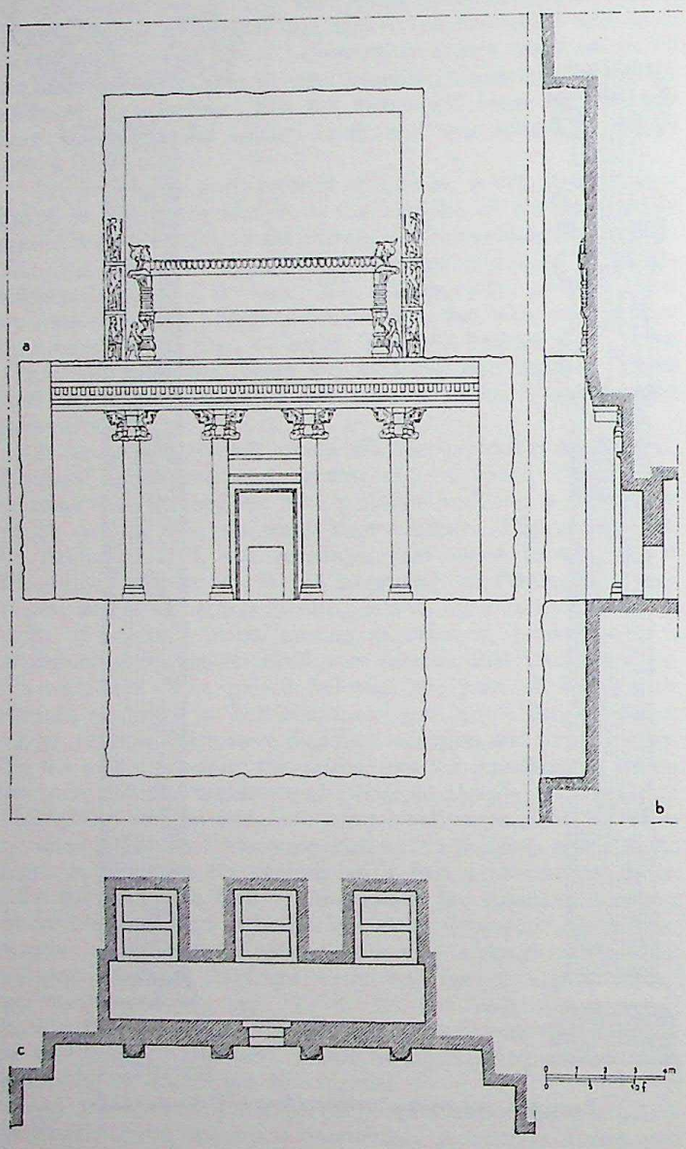
Religious structures. No religious edifices stood on the terraces of Susa or Persepolis. At Susa a fire temple, or *ayādanā*, was brought to light 2 $^{1}/_{2}$ miles from the town. At Naqsh-i-Rustam, opposite the royal tombs, there was a religious center with a temple in the form of a square tower (PL. 137), today called Ka'ba-i-Zardusht, very similar to one in ruins at Pasargadae. The remains of Elamite bas-reliefs sculptured on the rocks of Naqsh-i-Rustam seem to indicate a place worshiped before the time of the Persians.

The Mazdean temple appears to have been intended exclusively to preserve the eternal fire, to which only priests had access. The ceremonies must have unfolded before the faithful in the open air, around exterior altars whose fires were lit at the one maintained in the temple. The tower of Naqsh-i-Rustam was probably one of the temples for the preservation of the sacred fire. Built of fine blocks of white limestone, the edifice has on three sides three rows of blind windows made of black stones. On the fourth side a staircase leads to a door that

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

opens into a single room on a level with the first windows. It is thought that the temple sheltered a statue of Anahita when under Artaxerxes II the cult of this goddess as well as that of the god Mithras had taken on some importance. Before this king the images of gods played no part in the religion of the Achaemenids, and the representation of Ahura Mazda in a winged disk on the bas-relief of Persepolis or on the tombs,



Naqsh-i-Rustam, Achaemenid royal tomb: (*a*) Façade; (*b*) cross section of façade; (*c*) ground plan (*adapted from World History of Architecture. Moscow, 1948, in Russian*).

always over the king, served only to exalt the deeds accomplished by him under the protection and by the grace of the mighty god.

Sculpture and minor arts. The encounter of Persian and Greek art and the resulting amalgamation are illuminated by some monuments uncovered in the western possessions of the Achaemenid empire — works commissioned by Persian notables such as dynasts, satraps, or governors and executed by "Hellenized" Persians or local artists. One of the most important of these monuments was in a village near the presumed site of Dascylium (Daskyleion), capital of the old satrapy of Phrygia; fragments of it were found embedded in houses. One fragment of a bas-relief shows three women following one another on muleback. Nothing in the relief is Greek, neither the folds of the garments nor the eyes of the women or animals, which are presented frontally. This row of figures does not differ from those known at Susa and Persepolis. The same observation holds for another fragment representing a procession of horsemen. A third fragment shows another kind of subject: two sacrificers before a door with a heap of branches beside it, on which are placed two heads of animals. The treatment of this scene indicates a different hand, in spite of peculiarities that make it recognizable as Achaemenid — the headdresses, the clothes, the sacerdotal objects, the attitude of the priests, all of which point to a subject studied to the last detail. What is unfamiliar is the formula of expression. The eyes of the personages are in profile; their garments cinched by belts fall in folds; other folds can be seen at the bend of the elbow; an attempt to realize the third dimension makes itself felt in the volume of the barsoms.

Of Achaemenid human subjects modeled in the round we know only the fragments of the statue of Darius found in the palace of Susa and two little stone heads, of which one (Louvre) comes from Memphis in Egypt and the other (Brussels, Stoclet Coll.) perhaps also from the workshops of Egypt. One would look in vain for evidence that the artist wished to introduce a note of realism into the portrait. The head of a prince and that of an androcephalous bull obey the same laws; we see the same globular eyes overarched by long sinuous eyebrows, the same small mouth with thin lips, the same drooping mustache with curled ends, the same heavy head of hair with small curls reaching to the shoulders. The ideal type of youthful beauty is conveyed by a small head of lapis-lazuli paste — that of a royal prince, to judge from the crenelated crown — found at Persepolis and quite likely executed there (PL. 129).

The realism of Achaemenid art manifests its power in the representation of animals (PLS. 130, 138–40), as can be seen, too, in the reliefs of the Persepolitan Apadana, where the execution of the many different species reveals an effort to approximate nature. Carved in stone or founded in bronze, the animals — lion, argali, dog — served as guardians of entrances or, more often, as supports of vases, in which they were grouped by threes, their union a revival of the old traditions of tripods with legs ending in a hoof or a lion's paw. The Achaemenid artist was a worthy descendant of the animal sculptor of Luristan.

The archives of the Achaemenid empire were preserved at Ecbatana: so the Bible (Ezra 6:2) gives us to understand, and the excavations of Susa and Persepolis confirm it. All the royal treasures seized by Alexander the Great in the capitals were likewise stored, under the guardianship of Parmenio, at Ecbatana. It was there, or rather in the modern city of Hamadan, that a treasure was found in the 1930s, the most important pieces of which are divided between the Archaeological Museum of Teheran and the Metropolitan Museum in New York. As is also true for the treasure of Zawiyeh, what is known of it seems but a feeble reflection of what must actually have been brought to light.

Two solid-gold rhytons, one in New York, the other in Teheran (see Vanden Berghe, 1959, pl. 136d), in the shape of protomas of winged lions, constitute the principal pieces. Rhytons, so highly prized in later periods, were already in fashion among the Medo-Scythians; they are known in pottery, plain or polychrome, and there is reason to believe that they also existed in precious metals for the use of the Medes, whose traditions the Achaemenids inherited. To the ever more inventive creators of animal forms, who were not without naturalistic tendencies, these traditions provided a full repertory of Iranian works of the Achaemenid period, one which Parthian artists and those of outer Iran were to draw on in their turn.

One of the most heavily ornamented pieces is the gold bowl of Xerxes engraved with an inscription in three languages (Teheran, Archaeol. Mus.; see Vanden Berghe, 1959, pl. 136c). Its embossed decoration, like that of the rhytons, is typical for vessels of its kind. A corolla of petals forms the lower portion; a band of tassel shapes, each framed by a sort of bolster, fills the central portion, whose upper edge, just below the plain vertical rim, shows a row of drops. In a gold bowl bearing the name of Darius (II?; New York, Met. Mus.), on the other hand, the decoration is of great simplicity. The bottom of each bowl is decorated with a rosette, which motif links them

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

with Assyrian designs of the 8th–7th century, though the central knob is no longer in relief.

An Achaemenid gold plate, unique of its kind, is adorned in the center with a flying eagle (PL. 140). The delicately chased head and body, as well as the feet, are in profile; the wings and tail are presented frontally, following a tradition that goes back to the period of the Luristan bronzes and even left its mark on the painted vases of Tepe Sialk (Necropolis B). The border framing the central subject is embossed with downward-pointed "winged" hazelnut shapes alternating with upward-pointed almond shapes.

Two solid-gold swords were also part of the treasure. According to Herodotus, the Achaemenids carried such weapons during great ceremonies. The one in Teheran has a blade with a double ridge on the flat of it, a pommel consisting of two lions' heads (PL. 140), and a guard adorned with the heads of two ibexes. This decoration resurrects motifs of the Luristan bronzesmiths and, pointing up the kinship, directs our attention once more to the art of the Medes as the great precursor of Achaemenid art.

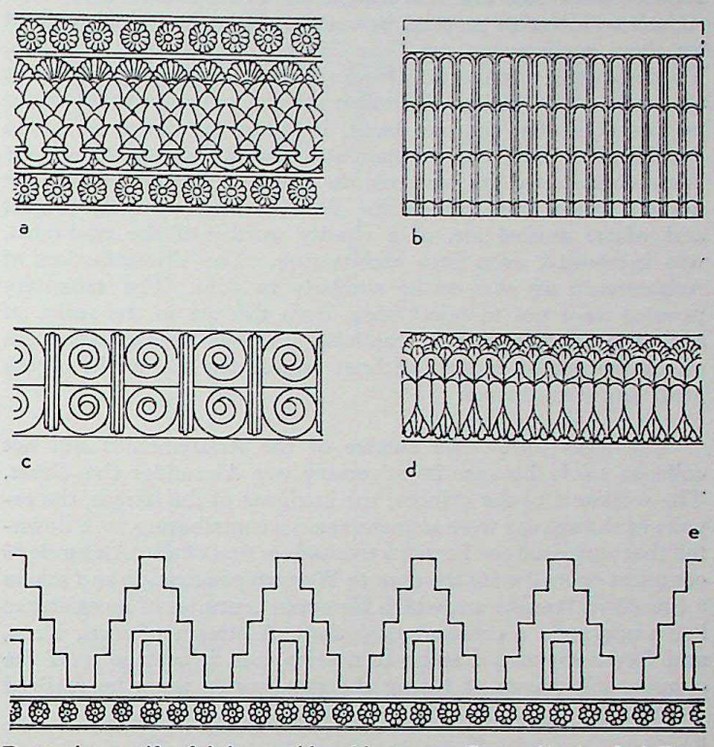
An important group of gold bracteates, of the same provenance, is divided between the Archaeological Museum of Teheran and the Oriental Institute of the University of Chicago. Some pieces with walking lions, whose muscles, sides, and flanks are partitioned for enamel filling, illustrate the old Iranian taste for polychromy; others show lions in respoussé within a ring; still others, only the heads of animals. Remarkable for its force of expression is a winged lion, within a circular stringlike frame, standing with one paw thrown forward and head turned backward, displaying menacing jaws.

Darius' robe on the bas-relief of his palace at Persepolis bears the engraved image of such lions, which in all probability were painted. The Achaemenids were not the first to introduce bracteates, as a decoration sewn on garments, in Iran. The fashion existed for centuries; and on objects dating as far back as those of Zawiyeh, animals are found alongside geometric motifs. Mesopotamia had been acquainted with such ornamentation of garments since the 2d millennium, particularly as applied to the robes of divinities and royal ceremonial robes, but until the Neo-Babylonian period the motifs of the bracteates were geometric. Two mutilated Babylonian cylinders from the Treasury of Persepolis, probably brought there as trophies, show bracteates in the form of birds and quadrupeds sewn on the dress of a divinity — perhaps Marduk (Schmidt, 1957, pp. 60–61, pl. 26, 2 and 3). The civilization of Luristan has not revealed such habits of luxury as those attested by the Scythian tomb of Zawiyeh, some objects of which mirror a fashion that also prevailed in Urartu on the garments of the divinities of the temple at Musasir. As to the decorative formulas employed in the bracteates, the animals presented partially or in heraldic ensembles in the art of Luristan offered a sufficiently rich iconographic repertory for Medo-Scythian and Achaemenid artists to draw on.

To the variety of languages of the peoples that constituted the empire corresponded a like variety of scripts. Babylonian, Elamite, and Old Persian were written in cuneiform characters on clay tablets, which were signed, barring some exceptions, by rolling engraved cylinders on them. The most frequent silhouette on the cylinders is that of the king with a long robe and a crenelated crown. The cylinders were not his, however, with the exception of those bearing his name; his image served as an emblem of the Achaemenid state. One cylinder, in chalcedony (Teheran, Foroughi Coll.), represents the sovereign standing on a lion and holding a bow and three arrows — an emblem of supreme power that we have previously encountered on an ivory from Zawiyeh.

Value and significance of Achaemenid art. The works of art discussed here were almost all conceived and realized for the use of the Great King, of princes, and of those of the great dignitaries who copied the example of their sovereign.

Many scholars, while acknowledging the unprecedented splendor of Achaemenid art, have criticized it for being a composite art that drew all, or nearly all, from forerunners or contemporaries; for being rootless; for passing to maturity without a period of evolution. Nevertheless, we have reached a stage in our knowledge of Iranian arts where a reassessment is called for. There need be no attempt to deny what is all too evident: that Achaemenid art, in obedience to the law that ruled the arts in every country, adopted the Mediterranean column or the hypostyle hall of Egyptian inspiration, the Urartian façade or the Babylonian palace and its decoration, or the Elamite rock-cut



Decorative motifs of Achaemenid architecture at Persepolis: (*a*, *d*, *e*) From the stairway of the Apadana; (*b*) from the "Hundred Column Hall"; (*c*) from the base of a column.

bas-relief with a multitude of personages. If the period of greatest Persian power corresponds to the interpretation given above, Iranian art could not have begun before the Achaemenids.

The present state of our knowledge permits us to recognize that Achaemenid art is but a logical continuation of what preceded it for more than four centuries on Iranian soil. The uncertain attribution of certain phases of Iranian art (Luristan bronzes, tomb of Zawiyeh) complicates the understanding of the sequence of events. The frequent references to the past in the preceding discussion were specifically meant to demonstrate that Achaemenid art is not a kind of phoenix but, on the contrary, it is deeply rooted in the epochs when the first Iranians took possession of the Plateau, and that the riches of their art accumulated century after century to constitute, at last, the splendid realization of Iranian art in its maturity.

Admittedly, in our knowledge of this evolution, one element, and one of capital importance, is missing. Median art almost completely eludes us; we guess at it rather than know it. And yet, though of short duration, it was certainly a powerful factor in the formation of Achaemenid art, its successor.

Cyrus's palaces did not spring up out of nothingness, and the rock tombs of the Median princes, with their columns, capitals, and reliefs, seem to lead us to the palaces of Ecbatana, still unknown. Achaemenid cuneiform writing existed before Cyrus; his bas-reliefs at Pasargadae, with their plastic rendering of the body, are closer to those of a Medo-Scythian tomb (Kiskapan) than to the Assyrian relief. Thus, much evidence can be gathered that Achaemenid art in attaining its greatness did not feed only on what foreign peoples had to offer. Quite on the contrary, it represents a plateau after a continuous ascent of Iranian art in the broadest sense that can be attributed to that term, for allied to the Medes and Persians were the Cimmerians and Scythians, each making their own contribution,

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

to bequeath to the Achaemenids the sum of a long sequence of creations.

That this was so is demonstrated by the very character of Achaemenid art, in essence deeply attached to the formula of ornament, of decoration. In the repetition of subjects on bas-reliefs, without concern for the resulting monotony, in the constant application of the same motif — the lion, for example, found here on a baldachin over the royal throne, there on the robe of a prince, elsewhere adorning a weapon or a jewel — Achaemenid artists go straight back to the applied arts practiced by their predecessors of Tepe Sialk, Luristan, and Zawiyeh. To deny their predilection for animal art is to take away their ancestors. The vision of Persian art can be understood under two aspects. On the one hand, it found expression in urban development and the monumental realizations to which the West contributed its part; on the other, it looked toward the nomad world from which the Persians derived their origins and whose animal art, of a vitality worthy of the traditions, was integrated even into architecture. The dissemination of Achaemenid art was to be similarly twofold. The sedentary peoples were not to reject ideas from this art in the realm of sculpture (particularly on capitals); nor was its expressiveness as animal art to remain without appeal for the world of the great Eurasian spaces.

PARTHIAN ART. The empire of the Achaemenids did not collapse solely because its adversary was Alexander the Great. The weakness of the princes, the intrigues of the harem, the revolts of the satraps were so many factors contributing to a downfall that surprised the Persians themselves first of all. Alexander's conquest opened wide the door to Western penetration and marks a breach in Iranian art, which for seven centuries of its existence had undergone a constant evolution. A stream of men, ideas, and forms invaded Iranian territories, and it seemed as if the conqueror's dream of fusing the two worlds must be realized

Distribution of the most important Parthian and Seleucid monuments in Iran. *Key*: (1) Modern national borders; (2) rock reliefs; (3) Seleucid and Parthian centers.

there. Yet the empire of which he laid the foundations was not to survive him. Seleucus, who inherited a major portion of the Achaemenid empire and who of Alexander's successors was the least unsympathetic to his ideas, founded a dynasty in which Iranian blood mingled in equal parts with Macedonian. Everything seemed to favor the process of Hellenization in the country. The reality, however, appears to have been very different. From the late 3d century B.C. onward, the Iranians, thanks to their vitality, were able to influence the conquerors in their turn.

It is known that in eastern Iran Alexander sought to reach the limits of the "sedentary world" and that he established a defensive cordon against the nomad Iranians on the Jaxartes, the present Syr Darya. Less than a century after his death the cordon began to yield before a new onslaught, that of the nomad horsemen, strong in their formation and armament, who were being cast back from the Eurasian pasture lands stretching over areas as vast as continents.

Toward the mid-3d century B.C. three waves of peoples who, it is thought, shared the same point of departure, apparently coming from the same confederation of Iranian tribes known to Herodotus under the name of Massagetae, and who pursued a nomadic existence in the immense area extending from the Caspian to Chinese Turkistan, advanced to the most easterly points ever reached by the Greco-Macedonian world. On the western flank the Sarmatians moved toward the rich Greek cities strung along the northern shore of the Black Sea. On the eastern flank the formation of the kingdom of the Hsiung-nu set into motion the Yüeh-chih, who, allied to the Śakas, put an end to the Greco-Bactrian kingdom in the 2d century B.C., to create at the beginning of our era a powerful empire that incorporated territories from eastern Iran to the valley of the Ganges and from Russian Turkistan to the Indian Ocean. In the center, coming from the plains to the north of the mountains of Khurasan (Khorasan), there advanced one of the tribes of the Dahae, the Parni, who under the leadership of the Arsacid dynasty tried about 250 B.C. to seize the Hyrcano-Parthian satrapy situated southeast of the Caspian; from there began the conquest of Iran, which they were to wrest from the Seleucids in the course of a century of struggle.

Two factors seem to have played a part in these upheavals: on the one hand, the thrust of the peoples, Iranians as well as Turko-Mongols, behind these nomads in motion; on the other, the growing weakness of the Seleucids and Greco-Bactrians, incapable of presenting a united front to the menace and exhausting themselves in internal conflicts. Never subsequently was the Iranian world to know so broad an expansion of the peoples related to it. They spread from the Black Sea with the Sarmatians, to the mouth of the Indus with the Śakas, from the Euphrates with the Parthians, to eastern India with the Kushans. All starting out from the same center, these Iranians were able, despite the diversity of peoples and of countries, of climates and of landscapes, to create in this vast expanse, as in a gigantic province, a composite civilization. The Parthian element played a preponderant role in it.

Nomads, successors of the Achaemenids, and contemporaries of the Greeks and Romans: such was to be the triptych whose parts were to form the constituent elements of the culture, and particularly of the art, of this period of Iranian history.

The reconquest of Iran by the Parthians took long. Starting out about 250 B.C., they did not reach the Euphrates, where the political boundary was to be stabilized for eight centuries to come, until about 140 B.C. Two centuries had elapsed since the fall of the Achaemenids, and more than a century passed before the nomads, under Mithradates II (ca. 123–87 B.C.), became the true masters of the country. Hence Parthian art, properly speaking, cannot be dated from 250 B.C.; a division into two periods is called for, though the demarcation, based on political events, is artificial: (1) the period preceding the 1st century B.C. and (2) the one beginning with the accession of Mithradates II, which was to find its continuation under the Sassanians.

Achaemenid traditions did not disappear after the conquest of Iran and the constitution of the Seleucid monarchy. The little temple with bas-reliefs (see Herzfeld, 1941, pl. 86) built about 300 B.C. by a local dynast at the foot of the terrace of Persepolis is the best proof of that. The Greeks and Macedonians transplanted by the thousands onto Iranian soil had brought with them a taste for arts very different from those of Iran, and they turned to artists who like themselves had left their homeland to seek their fortune in the rich Orient. Their taste

UP State Museum, Lucknow

is reflected in the bronze statuettes of the Hellenistic temple of Nihavand (Nihawand; Ghirshman, 1954, pl. 28). For the Parthian princes and nobles who had come from the solitudes of central Asia such works had a sure appeal. Many Hellenistic art works of the 2d century B.C. have been found in Nysa (Nisa), their most ancient capital. They even had Western artists work for them; witness the royal female head discovered at Susa, bearing a signature in Greek (Teheran, Archaeol. Mus.; Ghirshman, 1954, pl. 33b). For the Hellenized Iranians the local artists subjected to Western currents produced works that were neither Greek nor Iranian. In this hybrid art adaptation and form prevailed over spirit.

Thus, probably, was Greco-Iranian art born after the Macedonian conquest. There was likewise a traditionalist current, the little we know of which indicates a considerable regression. Thus there was not one art but several arts reflecting the upheavals suffered by the country and including, besides Hellenistic art, Greco-Iranian and Iranian art proper.

The hybrid aspect of Greco-Iranian art is particularly noticeable in architectural undertakings in which the two arts are amalgamated in the same way as in the works of the Persian artists in Asia Minor who in the Achaemenid era carved intaglios of Greek inspiration on seal stones. At Khurha, for example, is a temple on the Greek plan, with columns of Achaemenid module surmounted by capitals, probably of local origin, in a poor Ionic style — a kind of compromise between the volute capital of the Median tombs and reminiscences of Greek composition; each column rests on a base of Achaemenid type but has a torus bulging over a double plinth (FIG. 282). The artist, attracted by Greek architectonic elements, introduced them in his building without understanding their role or significance. The foreign element was not integrated; it remained a kind of veneer.

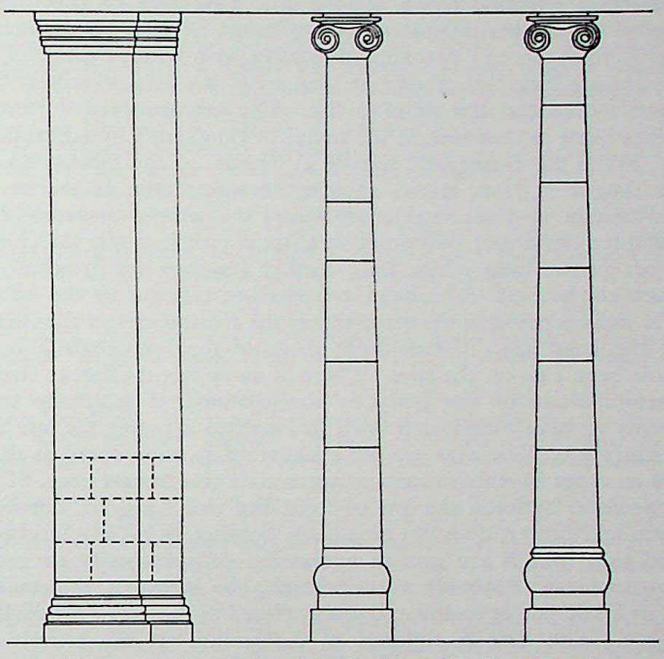
The first capital of the Parthians, Nysa was erected on the western border of the desert of Kara Kum, near the modern city of Ashkhabad. On a hill a Soviet expedition cleared a fortified royal palace of the 3d–2d century B.C. Its decoration on terracotta tiles reveals traces of strong Western influence mingled with Iranian subjects: crescents, rosettes, a quiver with arrows and a bow, which are regarded as the emblem of the Parthian warrior horseman, a club, the head of a lion — the guardian animal. Fragments of acanthus leaves of Western inspiration were found next to merlons of pure Achaemenid style. There was a central hall built on a triple-aisle plan, whose walls contained niches with statues of "deified ancestors." South of this complex rose another building, with a central courtyard surrounded by four liwans, where the expedition brought to light several Hellenistic sculptures of the 2d century B.C. and some forty ivory rhytons decorated with Iranian subjects or Western mythological scenes.

Can we interpret these as works of Greco-Bactrian art from the independent Greek kingdom that rose toward 250 B.C., with Balkh as its capital? Can it be that the Greco-Iranian symbiosis produced an original art which might reflect a more strongly cemented political union?

In the architecture of Nysa the nascent Parthian art reveals the complexity of its make-up. Iranian elements were influenced by Western currents, to which was joined an element peculiar to the Parthians from the steppes. The square courtyard with four liwans is probably the oldest example of the architecture that the Parthians introduced as far as Ashur (Assur). The liwan — the use of which became general in their architecture and spread far westward — has been interpreted as an extension of the nomad's tent with an opening on one side. The large triple-aisled hall seems to prefigure the division of Parthian palaces into three liwans. Vaults became the most frequent covering.

The liberation of Iran from foreign dominion brought the Parthians to the borders of the Euphrates. Opposite the Greek city of Seleucia on the Tigris they built their capital on a circular plan. This layout was not haphazard, for the nomads, on their excursions to distant steppes, erected their camps in a circle. They gave the same form to the city of Merv (Mary), and circular cities sprang up all along the route of their advance westward; among them were the great center of Shiz (mod. Takht-i-Sulaymān), the cities of Darabjird and Firuzabad in Fars, and the city of Hatra in northern Mesopotamia. The circular plan evokes another aspect of the life of this period: its insecurity.

Assyro-Babylonian taste in architecture did not demand external decoration of buildings. Under the Achaemenids polychrome glazed bricks and bas-reliefs, inspired by the idea of the orthostat, marked a slight progress in such decoration. Under the Parthians something new was created, specifically the façade. Successful, however, as the Parthian architect was in grasping the principle of the façade, he failed in its decoration, because he attempted to introduce Western elements. The Doric or Corinthian capital, the Ionic volute transformed into a spiral, are to such a degree barbarized that once more the Iranian artist betrays his incapacity or aversion for an assimilation, producing instead an assemblage. This holds true especially for Ashur in the 1st century of our era and for the stucco decoration of its façade, the only example known to us.



Columns of the temple at Khurha (*from Ghirshman, 1954*).

Iran was unfamiliar with stucco decoration before the Parthians, among whom it was in vogue for interior decoration together with mural painting. Murals are well represented in the Parthian palace on the island of Kuh-i-Khwaja, in the middle of Lake Hamun, on the Afghan border (see Herzfeld, 1941, pls. 101–04). The painting, in which color is filled in between heavy contour lines, gives the effect of a "colored drawing." Distributed over small panels, it shows palmettes, of Eastern origin, enriched by Western acanthus leaves; winged Erotes astride animals, whose frozen movements betray the Oriental touch; an Oriental portrait with the head in profile, the body fullface. The Western current in these murals of the 1st century of our era is not easy to explain. Is it attributable to the influence of Greco-Bactrian art, as Herzfeld thought, or to a new wave of Greco-Roman influence, which also seems to have marked the art of Hatra and spread far eastward, leaving its imprint on the Greco-Buddhist art of Gandhara (q.v.)?

More Iranian and Parthian is the mural of the Mithraeum at Dura-Europos, on the Euphrates, representing Mithras hunting a variety of animals (Rostovtzeff, 1938, pl. 18). Dressed as an Iranian, with a short embroidered tunic and ornamented trousers, tight at the ankles, he looks like a Parthian or a nobleman of Palmyra; he is armed with the composite Iranian bow and, his foot pointed downward, rides a horse harnessed in the Iranian manner, with round phalerae. His head and torso are fullface, but his horse is in profile. The flying gallop, the favorite pose for animals on the "Greco-Persian" intaglios, was *de ri-*

gueur. Everything here is Iranian, even the few isolated plants that are supposed to create the impression of a landscape. In spite of the idea of a race that the beasts and the god who pursues them are meant to convey, the action remains suspended.

Frontality, which accentuates the ritual aspects of sacrifice scenes, was dear to the Parthian artist, who cultivated it as a traditionalist — continuing the traditions not of Achaemenid art but of the art from Luristan, which was perhaps also practiced on the confines of Iran. It is exemplified in certain mural paintings at Dura-Europos, as well as in a block with basreliefs at Bisutun (mod. Behistun). One side of this block shows a Parthian prince sacrificing before an altar (Ghirshman, 1954, pl. 35a); the two adjoining sides, two winged genii. The personage faces strictly front; the artist lovingly executed the details of dress; the relief is flat. The gesture fixed in stone is the same as that seen in the mural of Conon at Dura-Europos.

From the Hellenistic temple at Shami, in the mountains of southwestern Iran, comes an over-life-size statue in bronze of a Parthian lord (PL. 141). He wears the simple costume of a Parthian horseman, composed of a jacket crossing over the chest, short pants, over which long leather leggings are attached in back at the belt. The head, too small in relation to the body, was not executed in the same place; the treatment and the metal of the head are different from those of the body, which may have been cast on the spot. There is no apparent effort to stress particularities of the body or the costume, a tendency that seems to have manifested itself in Parthian art after the late 1st century B.C. The eyes are not exaggeratedly wide open, as they are in other Parthian works to accentuate the frontal pose. The opposition between the law of frontality and freedom, between form and power, does not create any conflict. The low forehead and thin mouth are not an expression of spirituality or great sensitiveness. Probably not a portrait, the statue is impressive in its static power and would seem related to the art of the earlier phase. The date is difficult to determine. If the temple at Shami was destroyed by Mithradates I, the statue might be of the 2d century B.C.

The Seleucid and Parthian levels at Susa have revealed the existence of a hybrid society in which Iranians and Semites lived side by side with Greeks and Macedonians. In the same district houses built according to the local plan, with a central courtyard, stood next to villas in which the courtyard had a peristyle, the gabled roof was covered with tiles and embellished with terra-cotta acroteriums, and the rooms were decorated with murals. Statuettes representing Herakles, whose cult was widespread in the Parthian kingdom, appeared side by side with representations of divinities (?) whose ethnic type and costumes are of an Oriental cast. Examples of the "grotesque" Alexandrian style were found not far from works in which the two arts were united, as in that emblema (PL. 142) where a goddess of Hellenistic aspect, squeezing her breast over a cup, is enclosed in a framed and pedimented medallion.

As circumstances would have it, after the conquest of Alexander two peoples, Greeks and Iranians, lived together in the same city, in the same quarter, where mixed marriages became commonplace. Two profoundly different conceptions of life and beauty thus came to confront each other. On the one hand, all interest focused on the modeling, the plasticity of the body, its life; on the other, there was nothing but dryness and severity, a linear vision, rigidness, frontality. Greco-Iranian art was the logical product of the encounter.

The reconquest of the country by the Parthians brought a slow return to Iranian traditionalism, which took on the forms of a Neo-Iranian art. Its technique is marked by the disappearance of plastic form; its repertory characterizes it: scenes of combat, hunting, banqueting, or else of investiture or sacrifice. This return to traditionalism was beset by a poverty of workmanship that burdened Parthian art until the end and was inherited by early Sassanian art (q.v.). But the Greek element was not banished; it contributed especially to architecture. However, everything Hellenic was to such an extent barbarized — the metamorphosis was so profound — that it is difficult to identify and trace the origin of a capital or the composition of a façade. The Parthian artist did not imitate; he subordinated.

His art was not the first to cultivate frontality. The potter and coroplast of Tepe Sialk practiced it; and the bronzesmith of Luristan, whose works consisted chiefly of funerary furnishings, adopted it on a large scale, thus seeming to create an atmosphere in which the faithful could establish a more direct contact with the divinity by looking it full in the face. The art of outer Iran, from southern Russia to India, was not to neglect this principle either.

Even while linked by many a bond to the iconography of the "Greco-Persian" intaglios, Parthian art remained faithful to its repertory and was diffused far beyond the frontiers of Iran, among peoples who, whether they were Iranians, Turks, or Mongols, had in common a life on horseback and continual contact with animals. Combats between men, between men and animals, or between animals furnished the favorite artistic subjects to the peoples of Asia and southern Russia during the centuries that preceded and followed the birth of the Christian Era. Parthian art, though not everywhere the sole animating force, remained a dominant one, responsible in large part for the creation of a far-spread idiom among the societies with which the Parthians were linked by their atavism and their traditions. On a strictly Iranian plane they appear as the successors of the Achaemenids, respectful of traditions and concerned with national policy.

The importance of the Parthian period in its successful renewal of the Iranian national spirit is beginning to be recognized; no longer can one believe in a sudden Sassanian renaissance. The Parthians were able to ensure continuity and establish a link between Achaemenids and Sassanians (see also PARTHIAN ART).

IRAQ. Established in 1920 under British mandate and in 1932 as an independent state, Iraq is bounded on the west by Syria and Jordan, on the north by Turkey along a demarcation line that skirts the lower foothills of the mountains in

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

Kurdistan, and on the east by Iran along the Zagros Mountains; on the southwest it fronts on the Persian Gulf; to the south it borders on Kuwait and Saudi Arabia. Modern Iraq covers virtually the same area as ancient Mesopotamia (lying outside it are the western portions, now part of Syria and Turkey, and a small strip belonging to Iran); it therefore contains a large share of the archaeological remains and monuments of the great Mesopotamian civilizations (see MESOPOTAMIA) and the classical, Iranian, and Islamic cultures that developed successively within its confines.

SUMMARY. Cultural and artistic epochs (col. 287). Art centers and monuments (col. 292): *Southern Iraq; Central Iraq; Northern Iraq.*

CULTURAL AND ARTISTIC EPOCHS. The presence of Paleolithic hunters in Iraq is evidenced by a series of caverns in the mountainous region between Kirkuk and Sulaymāniya. The settlement of Jarmo reveals the transition, in the Neolithic period, to an agricultural civilization; the presence of the bones of domestic animals attests the beginning of domestication, while crude clay figurines cast light on religious practices. With the 4th millennium, the transition of the Mesopotamian culture to the chalcolithic and the further developments of the latter are marked by different types of pottery; from the pottery of Hassuna, Samarra, and Tell Halaf are derived the names of the chalcolithic cultures of northern Iraq, which are strands in a broader cultural nexus extending from Iran to Syria. In the period immediately following that of Ḥājj Muḥammad and in the middle and late chalcolithic, marked by the cultural phases designated as al-'Ubaid I and II, the practice of irrigation developed on the flood plain of southern Iraq; in this same period the first cities were founded by inhabitants whose origin is uncertain but who were probably pre-Sumerian, since many city names are non-Sumerian (see MESOPOTAMIA).

The Sumerian city-states, with their typical organization centering politically and economically upon municipal temples, were the protagonists of the great development characterizing Mesopotamian protohistory. With the epoch of Uruk VI–IV, about 3000 B.C. (according to the "short" chronology of W. F. Albright and F. Cornelius), there appeared the first written documents, which become increasingly abundant and intelligible in the succeeding period of Jamdat Naṣr (ca. 2800–2700 B.C.). The Jamdat Naṣr period, while marking the continuation of the artistic and cultural high point of the age of Uruk IV, is characterized by the diffusion, albeit partial, of the Sumerian cultural heritage into the adjacent territories of the Near East, from Iran to Syria, from Anatolia to Egypt, which in this particular period received vital stimuli from Mesopotamia in the fields of writing and art. In Iraq, on the other hand, the cultural area and centers of art production extended northward in the succeeding period (ca. 2600 B.C.), named after Mesilim, a king of Kish, whose inscribed macehead has been found. This period marked the beginning of the great artistic heyday of the cities of Diyala (Eshnunna, Khafaje, Tell Agrab), which American excavations have admirably revealed.

Sumerian art can be said to have reached full maturity during the succeeding historical and cultural period (ca. 2500–2350 B.C.), which takes its name from the 1st dynasty of Ur and which marks a point of equilibrium among Sumerian city-states broken only at the close of the conquests of Lugalzaggisi of Umma and thereafter by the advent of the Semitic king Sargon. At that time there extended from the south to the north of the region, and also in territory that was geographically Mesopotamian though now Syrian — such as Mari, for instance — a rich full-blown art production, centered chiefly in Ur, Lagash, Khafaje, Tell Agrab, and Ashur, as well as in Mari (see SYRIA; SYRO-PALESTINIAN ART); the highest achievements of this art are to be found in temple architecture, sculpture, and glyptic art.

The rise to power of Sargon and of the Semitic dynasty of Akkad (ca. 2350–2150 B.C.), which unified the region under their rule, marked a strengthening of the Semitic element in the ethnic make-up of ancient Mesopotamia; in regard to art, while no clear-cut distinction can be made and the new period represents a further development rather than an interruption of the artistic tradition, a limited degree of innovation along naturalistic lines can be detected in Sumerian art, together with greater concern with representation of secular events — as depicted in commemorative war steles, for example. However, the development of Mesopotamian culture under the dynasty of Akkad came to an abrupt halt with the invasion by tribes from the neighboring Iranian mountains, the barbarian Guti, under whom artistic creation ceased. It resumed after the expulsion of the Guti, when the Sumerian city-states were briefly revived (ca. 2050–1950 B.C.). The promoters of this Sumerian renaissance may be said to have been the rulers of the 3d dynasty of Ur, after whom this period is named; this revival reached its artistic peak in the city of Lagash, where its ruler, Gudea, left the richest set of statues of a sovereign in all ancient Mesopotamia.

About 2000 B.C. a new phase of history opens with the advent of the so-called "Amorites," western Semites who spread over the entire area of the Fertile Crescent and founded a series of city-states; in Mesopotamia there arose Isin, Larsa, Ashur, Mari, and, finally, Babylon, which under the lawgiver Hammurabi (ca. 1728–1686 B.C.) united the entire territory into a kingdom that was to last until 1530 B.C. From then on Semitic hegemony was undisputed. Artistically, the most important production radiated from Mari, while the surviving examples from Babylon are quite limited: by and large, however, it can be said that the creative power of Sumerian art was not matched by a comparable ability among the Semitic peoples, who confined themselves to elaborating further the art forms of previous centuries.

As early as the Amoritic age, the ethnic balance of the region was disturbed by the advent of new tribes: the "mountain people," Indo-Europeans, largely of the ruling class. These peoples — Hittites, Hurrians, and Kassites — imposed their rule in Anatolia, where they created outstanding art forms (see HITTITE ART); in Mesopotamia, where they also established their political rule (the Hurrians in the north, the Kassites in the south), they left marks of their attacks, together with elements of indigenous development.

Meanwhile, in the north, the Middle Assyrian empire was established, reaching the peak of its power about 1100 B.C. with Tiglath-pileser I; after a brief period of crisis, it resumed its expansion in the first half of the succeeding millennium, managing to unify under its sway first Babylonia and then Egypt (671 B.C.). However temporary this latter conquest, it was a significant indication of the great expansive power of the new empire, a power matched by remarkable cultural and artistic vigor, which is particularly evident in the great palaces of the rulers and in their mural reliefs. A clear-cut historical, and what might be called "lay," tradition emerges from these reliefs — very different from the typically ritualistic tradition of southern Mesopotamia.

The abrupt fall of Nineveh, and with it the Assyrian Empire, brought about by the Babylonians and Medes (612 B.C.), placed Babylon in the spotlight of Mesopotamian history for the last time: in the brief period of the Neo-Babylonian or Chaldean dynasty, which extended its rule over a wide radius, the art of the capital city reached its peak in the imposing buildings and the celebrated decorations of walls and streets in glazed brick. This art, though little removed in time from that of the Assyrian palaces, differs profoundly from it, as is shown by the diversity of architectural structures and the absence of orthostats in relief. Thus, the area north of Mesopotamia was perhaps dominated by Sumerian tradition, the region south of it possibly affected by Semitic penetration or by the infiltration of various foreign elements (see ASIA, WEST).

With the conquest of Cyrus in 539 B.C., the territory of modern Iraq, cradle of the Sumero-Akkadian and Babylonian-Assyrian civilizations, lost its independence and became a province of other empires (even artistically, to a great extent): of the Persian empire, first of all (538–331 B.C.); next (312–140 B.C.), after Alexander's conquest, of the kingdom of the Seleucids (see HELLENISTIC ART); later (140 B.C.–A.D. 226), of the Arsacids, with a brief period of Roman domination (see ROMAN ART OF THE EASTERN EMPIRE); and subsequently (A.D. 226–637), of the Sassanids (see SASSANIAN ART).

Iraq was Arabized and Islamized within a few decades after the death of Mohammed. The battle of Qadisiya (Kadisiya; A.D. 637) put an end to Persian rule there, and the establishment of the two Arab metropolises of Kufa and Basra quickly turned the country into a hotbed of Arabism. The caliph 'Alī ibn-abī-Ṭālib made Kufa his capital for a short time, but in general, during the Ommiad period, the Iraqi area remained a marginal region in comparison with the splendid development of Syria and the gravitation of Islamic power toward the Mediterranean. Despite its proximity, the Iranian world, with its great wealth of cultural traditions, was unable to leave any individual impress on these regions, even though there was no lack of Sassanian elements surviving in Ommiad art. In the century following the Ommiad caliphate of Syria, Iraq was the headquarters of the Shiite opposition, which culminated in the revolt of al-Mukhtār but was held in check by the vigor of the great Ommiad governor or viceroy, al-Ḥājjāj. When the Ommiad caliphate was defeated and supplanted by the Abbassides in the mid-8th century, the conquerors, arriving victorious in Iraq at the head of the troops of Khorasan, made Iraq their residence. There, in 672, al-Manṣūr founded Baghdad, destined soon to become the great metropolis of the entire Islamic East and to remain for centuries the seat of the caliphate and the capital of the Moslem civilization (see ABBASSIDE ART; ISLAM). Founded with Baghdad, which was built on a circular plan, was Raqqa (or Rakka; now in Syria), built on a horseshoe-shaped plan; Raqqa was to become, somewhat later,

one of the major centers of Islamic art. Samarra especially, with its Great Mosque topped by a high spiral tower, reveals not only the Iranian influence which became dominant through the Abbassides — called the Moslem Sassanians — but also, through its ceramics, shows evidence of the contacts maintained with the Far East, that is, with T'ang China. The first three centuries of the Abbasside caliphate (8th–11th cent.) represent the golden age of Iraq, but even though the political power of the caliphs was enfeebled through

the disintegration of the empire and the defeat at the hands of non-Arab elements such as Persians and Turks, Iraq retained a position of cultural primacy. The crisis grew more acute after the year 1000, when the caliphs became mere instruments of alien dynasties — first the Buyids, then the Seljuks — and were ultimately overthrown in the mid-13th century during the second Mongol invasion led by Hūlāgū (Baghdad being captured in 1258). Iraq then underwent a long and profound decline, during which the monuments of the Abbasside period, among others, were almost entirely lost. In the Seljuk period, the entire Iraqi territory again entered upon a period of artistic rebirth under the auspices of the Turkish dynasties (see SELJUK ART). The works created during this period reveal the magnitude of the formal contributions that enriched their art, which was still dominated by Turko-Iranian ingeniousness in blending traditional elements from Iran with others of Central Iranian origin.

After having been a province of the Mongol empire of the Ilkhans, Iraq experienced the rule of petty local dynasties and at the end of the 14th century was overrun and sacked by Tamerlane; however, this did not completely interrupt its art production. Baghdad, for instance, is still considered to have been the greatest center for miniatures illustrating the Koran. In 1509 Iraq was taken over by Persia under the Safavids but was quickly contested by the Ottomans in lengthy wars, which ended only in 1638 with the definitive conquest of the country by Sultan Murād IV. The Ottoman domination, which marked the lowest point of Iraq's history, persisted until the country became a theater of operations during World War I. Among the scant vestiges of architecture of the Ottoman period, Iraq can take pride in the remarkable ruins of Turkish fortifications at Baghdad, Mosul, and Samarra, a modern city still encircled by fortifications from the 19th century; the Adamiya and Ḥaydar Khāna mosques in Baghdad and the Nabī Shith Mosque in Mosul; the al-Mustanṣiriya Madrasah in Baghdad and those of Basra and Mosul; and the monumental city gates of Baghdad. In 1921, the English, who had occupied it and placed it under a mandate, made a kingdom of it under the Hashemite dynasty of Fayṣal, son of King Ḥusayn ibn-'Alī of the Hejaz (al-Hijaz).

The independence of the new Iraqi state — at first purely nominal, since it was subject to British control — was gradually realized in the period between the two world wars. In 1932 the mandate was replaced by a military treaty of alliance with Great Britain. At the end of World War II, the military occupation came to an end. In July, 1958, a revolution put an end to the Hashemite monarchy; Iraq has since then been a republic.

Recent architectural accomplishments of interest, among which may be numbered many public works as well as a great many private buildings, are concentrated in the capital. Outstanding examples of present-day city planning and solutions of architectural problems are the health resort of Ṣalāḥ al-Dīn (with its Hotel Pirman, swimming pools, and sports facilities) and the technical installations of the Iraq Petroleum Company at Basra and Kirkuk, where residential quarters, administrative offices, and technological and scientific institutes have been built.

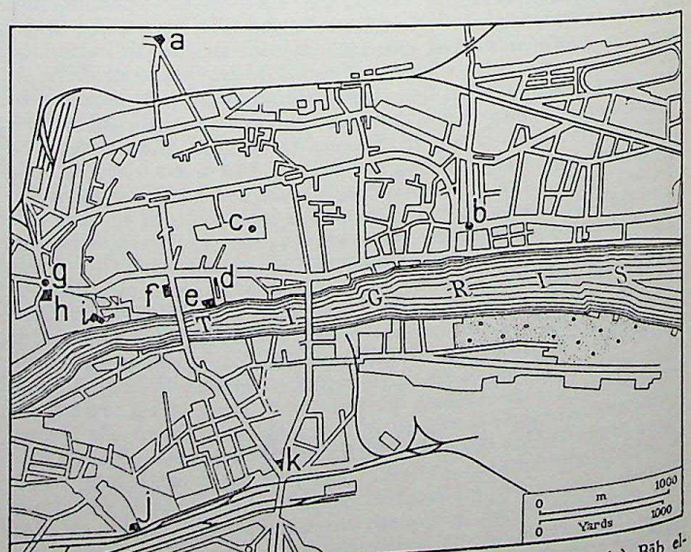
ART CENTERS AND MONUMENTS. The survey of art centers will proceed from south to north and from east to west. Baghdad will be considered first.

Baghdad. Of all the metropolises of ancient Islam, Baghdad has preserved the fewest vestiges of its past greatness. The only surviving monuments of any importance from the Abbasside period are the al-Mustanṣiriya Madrasah, founded in 1233, reduced in the Ottoman period to a customshouse, and now restored and freed of encumbering structures, and the Palace of the Abbassides, now a



Baghdad, plan of the central district. Principal monuments: (*a*) Bāb el-Wasṭāni; (*b*) Bāb el-Khargi; (*c*) minaret of the Sūq al-Ghazl; (*d*) Islamic (Arab) Museum; (*e*) al-Mustanṣiriya Madrasah; (*f*) Iraq Museum; (*g*) Bāb el-Mu'aẓẓam; (*h*) former King Faisal II Hall; (*i*) Abbasside Palace Museum; (*j*) tomb of Zubayda; (*k*) Assyrian Gate.

museum (both, I, PL. 6); there are also part of the city walls, with a few gates (the most important, the Talisman Gate, was destroyed during World War II), the Sūq al-Ghazl quarter (also dating from the 13th cent.), and a few ancient sections of the Mīrjāniya and Khāsṣekī mosques. Outside the city proper are the tomb of Zubayda,

which is an octagonal structure topped by a pyramidal tower with stalactites, and the sanctuary of Khadimain (al-Kāẓimayn; I, PL. 12). Systematic excavations on the western bank of the Tigris, where the medieval city stood, may produce outstanding results in regard to topography and monuments.

The modern city stands on the eastern bank of the Tigris, extending for about 12 miles. Destroyed by Tamerlane in 1400, Baghdad was a bone of contention between the Turks and Persians for two centuries; it was sacked by Sultan Murād in 1638 and fell to the Ottoman Turks, which hastened its decline. In 1869, the Turkish governor ordered the razing of virtually all the fortifications except the gates. In 1932, when Iraq gained independence, Baghdad became the capital and official residence of the ruling dynasty. Pursuant to the 1938–39 master plan for the city's development, great arteries were constructed, such as Ghazi and Mansur streets, and modern public squares were opened up in the compact mass of the *sūqs* which still characterize the urban center on the eastern bank. A model residential quarter, Karada, was recently constructed southeast of the city. Of special interest among the oldest and best-preserved buildings are the Islamic (Arab) Museum, formerly a seraglio from the 14th century; the Adamiya Mosque (rebuilt, 18th cent.), after which the entire quarter extending northward is named; and the surviving monumental gates of the vanished city walls (Bāb el-Wastāni, Bāb el-Muʿaẓẓam and Bāb el-Khargi). Dating from the 19th century are the great Ḥaydar Khāna Mosque, the al-Mustanṣiriya Madrasah (early 13th cent., but drastically remodeled in 1823; I, PL. 6), the Citadel built by the Turkish governor Midhat Pasha (1869–72), and the seat of the important Iraq Museum. Among the prominent 20th-century monuments, but still embodying the local tradition, are the Assyrian Gate (which was to serve as the monumental entrance of the Iraq Museum); the Central Station, with its great blue dome; and villas, residences, and office buildings — such as the central office of the Armenian community, built in 1954 — mostly designed by the local architect R. K. Chandirli (b. 1926), who blends tradition and the exigencies of contemporary international trends.

Ground was broken in 1962 for the new University of Baghdad, designed by The Architects Collaborative International Limited, under the direction of Walter Gropius, Robert S. MacMillan, and Louis A. MacMillen. Envisioned as a "university city," the project comprises academic and library buildings, administrative headquarters, living quarters for faculty and students, sports facilities, a mosque, and a service block.

Baghdād, I, 2d ed., Leiden, London, 1959, pp. 894–908; The University of Baghdad, Casabella, No. 242, Aug., 1960.

Southern Iraq. Basra (Bassora). Chief city of southern Iraq. Occupied by the Turks in 1668, besieged in 1768 by the Persians who held it for a year, it subsequently fell into the hands of a local Arab chieftain and was retaken by the Turks in 1787. Occupied by the English troops in 1914, the city shared the vicissitudes of the nation. The British influence on the city dates back to 1643, when the English founded a thriving trade center there. Present-day metropolitan Basra consists of three communities: Maʿqil, the coastal quarter, with a very modern port and an airport; ʿAshar, the residential and administrative quarter; and Basra, the old city, where no significant architectural monuments remain. Among the most modern buildings in the environs are those of the Iraq Petroleum Company.

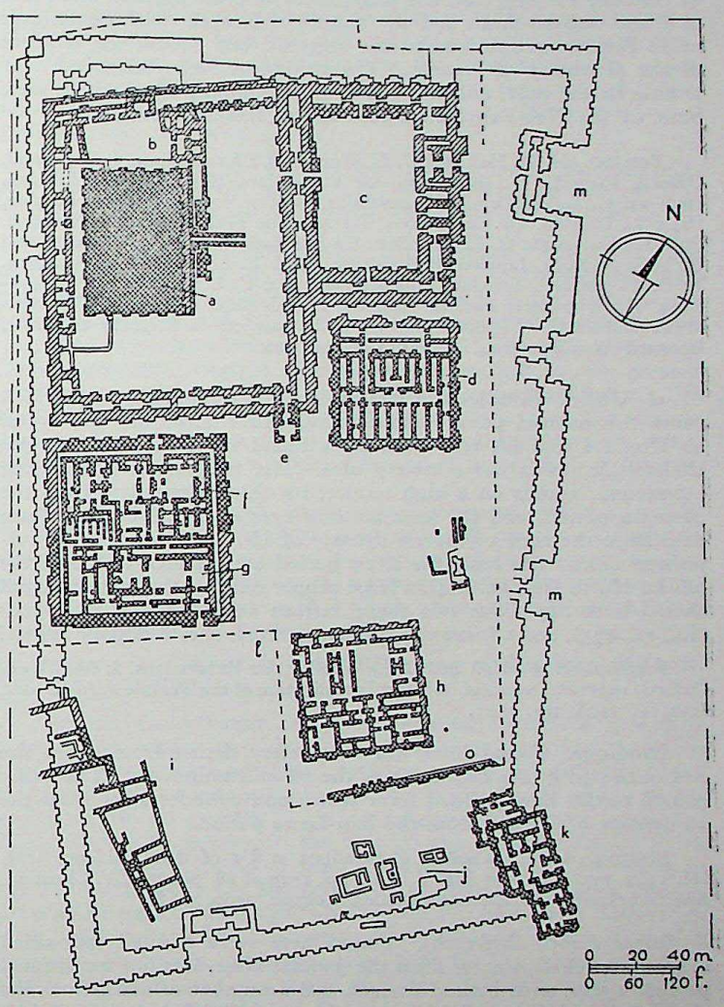
Tell el-Lahm. Site where the explorations of R. Campbell Thompson and the later ones of F. Safar have brought to light a number of bricks bearing the names of the Babylonian kings Bur-Sin and Nabonidus, some tombs from the Neo-Babylonian period, and the ruins of two structures whose function is not known.

BIBLIOG. R. Campbell Thompson, The British Museum Excavations at Abu Shahrain in Mesopotamia in 1918, Archaeologia, LXX, 1920, pp. 101–44 at 141; F. Safar, Soundings at Tell al-Lahm, Sumer, V, 1949, pp. 154–72.

Eridu (Ἰρίδωτις, mod. Abū-Shāhrayn). The remains of the early chalcolithic sanctuary of Enki (Ea) have been discovered in levels XIX–XV. These levels are characterized by the so-called "Eridu" or "Ḥājj Muḥammad" pottery, which corresponds to the northern pottery of Tell Halaf, developed somewhat later. The middle chalcolithic period is documented in levels XIV–VIII by Temples XI, IX, and VIII; connected with these levels is the pottery of al-ʿUbaid. Temple VII is from the late chalcolithic period; a slant-eyed male figure and a small clay ship model also come from this period. From the early Uruk period there are several religious and secular structures; from the Mesilim period, two palaces of plano-convex bricks and an alabaster statuette of a male figure. The ziggurat was built by King Ur-Nammu at the time of the 3d dynasty of Ur; the two basalt lions placed alongside the portal have been considered contemporaneous but were probably imported.

BIBLIOG. S. Lloyd and F. Safar, Eridu, Sumer, III, 1947, pp. 84–111, IV, 1948, pp. 115–27; E. Douglas van Buren, Excavations at Eridu, Orientalia, XVII, 1948, pp. 115–19; A. Shukri, The Lion of Eridu, Sumer, IV, 1948, pp. 81–85; E. Douglas van Buren, Discoveries at Eridu, Orientalia, XVIII, 1949, pp. 123–24, pls. 3–9; F. Safar, Eridu: A Preliminary Report on the 3d Season's Investigations, Sumer, VI, 1950, pp. 27–38.

Ur (mod. Muqayyar or Muqaiyir). The remains of middle chalcolithic houses with terra-cotta figurines and pottery of early al-ʿUbaid



Ur, plan of the sacred enclosure. Principal buildings: (*a*) Ziggurat; (*b*) sanctuary of Nannar; (*c*) court of Nannar; (*d*) E-nun-makh; (*e*) E-dub-lal-makh; (*f*) Gig-par-ku; (*g*) temple of Ningal; (*h*) palace or temple of E-khur-sag; (*i*) temple of Nimintabba; (*j*) royal tombs of the 1st dynasty; (*k*) tombs of Shulgi and Bur-Sin; (*l*) walls from period of Ur III; (*m*) Neo-Babylonian and Persian walls.

type were discovered in the earliest levels; similar finds have been made from the late chalcolithic period. Dating from the Jamdat Naṣr period, as evidenced by the characteristic painted pottery, are a number of stone vases with relief decoration and some cylinder and stamp seals. The level of the Jamdat Naṣr-Mesilim transitional period has yielded other seals and steatite vases with relief decoration. Few cylinder seals from the Mesilim period were found in the royal cemetery, which has, however, yielded extremely rich findings in the style of the 1st dynasty of Ur: harps and lyres (I, PL. 505; X, PL. 226); the so-called "Standard" of Ur (PL. 77; IX, PL. 471); gaming boards (VI, PL. 5); vases of bronze, silver, and gold; the golden helmet of Mes-kalam-dug (VI, PL. 243); weapons; precious ornaments (I, PL. 509); and cylinder seals. Contemporaneous with these royal tombs is the sanctuary of Nannar, which underlies in part the latest ziggurat from the 3d dynasty. Also dating from this period are a number of statuettes, including one of Entemena of Lagash, and the characteristic votive slabs bearing scenes in relief. From the later tombs of the royal cemetery (age of Akkad) come utensils, weapons, ornaments, pottery and seals; contemporaneous with these are a small head of a priestess (Louvre), and a relief of Enkheduanna, daughter of Sargon. During the period of the 3d

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

dynasty of Ur, the city was extended by a series of religious structures (FIG. 294): new royal tombs were added to the old ones, and to the north of these were erected the palace or temple of E-khur-sag, the Gig-par-ku of the priestesses, the storehouse of the treasury E-nun-makh, and the great ziggurat (I, FIG. 867; III, PL. 485). The sanctuary of Nannar was restored by Ur-Nammu and his successors. Outstanding among the sculptures of this period are statues in the round, a stele of Ur-Nammu, and some seal impressions. In the early Babylonian period, Rim-Sin rebuilt in the port the temple of Enki, which had been constructed just previously. Under the Kassites, many restorations were made by King Kurigalzu I: the sanctuary of Nannar, the ziggurat, the Gig-par-ku, and the adjacent structures of the E-dub-lal-makh and the temple of Ningal. Nebuchadnezzar made further restorations to the ziggurat, and rebuilt the temenos of the sanctuary of Nannar. The temple of Nebuchadnezzar, the temple in the port, and the palace of Nabonidus, all of which were built in the Neo-Babylonian period, still remain standing.

BIBLIOG. H. R. Hall and C. L. Woolley, Ur Excavations, I: Al-'Ubaid, Oxford, 1927; C. J. Gadd et al., Ur Excavations: Texts, 5 vols., London, 1928–53; C. L. Leonard Woolley (Iraq, XXII), London, 1960.

al-'Ubaid. Middle- and late-chalcolithic settlement, from which came the painted pottery named after this site; of the two types, al-'Ubaid I and II, that have been found here, the latter is late chalcolithic, as is the cemetery also. The temple, an outstanding monument, stands on a high terrace; its oldest parts date from the Mesilim period, and the later sections erected on an oval platform date from the time of the 1st dynasty of Ur. Among the most important discoveries from the latter period are a seated statue of the official Kurlil (IX, PL. 474), a large copper relief of the god Imdugud shown hovering above two stags, various animal figures in copper (IX, PL. 475), and a frieze of advancing animals and of milking scenes.

BIBLIOG. H. R. Hall and C. L. Woolley, Ur Excavations, I: Al-'Ubaid, Oxford, 1927; P. Delougaz, A Short Investigation of the Temple at Al-'Ubaid, Iraq, V, 1938, pp. 1–11.

Diqdiqqe. Found here was a cemetery dating from about the end of the 3d or the beginning of the 2d millennium B.C. The badly ruined tombs have yielded terra cottas and cylinder seals from the 3d dynasty of Ur and from the Isin-Larsa period.

BIBLIOG. C. L. Woolley, Excavations at Ur of the Chaldees, AntJ, III, 1923, pp. 311–33 at 332, V, 1925, pp. 1–20 at 18, pls. 7–8; V. Christian, Altertumskunde des Zweistromlandes, Leipzig, 1940, p. 83.

Larsa (mod. Senkereh). Found here were a small four-sided stele, with reliefs, dating from the Jamdat Naṣr-Mesilim transitional period; a vase with incised designs and a number of seals, from the time of the 3d dynasty of Ur; and, from the Old Babylonian period, the palace of Nūr-Adad, two commendable bronze works depicting a kneeling worshiper and a group of three rearing stags, and miscellaneous seals.

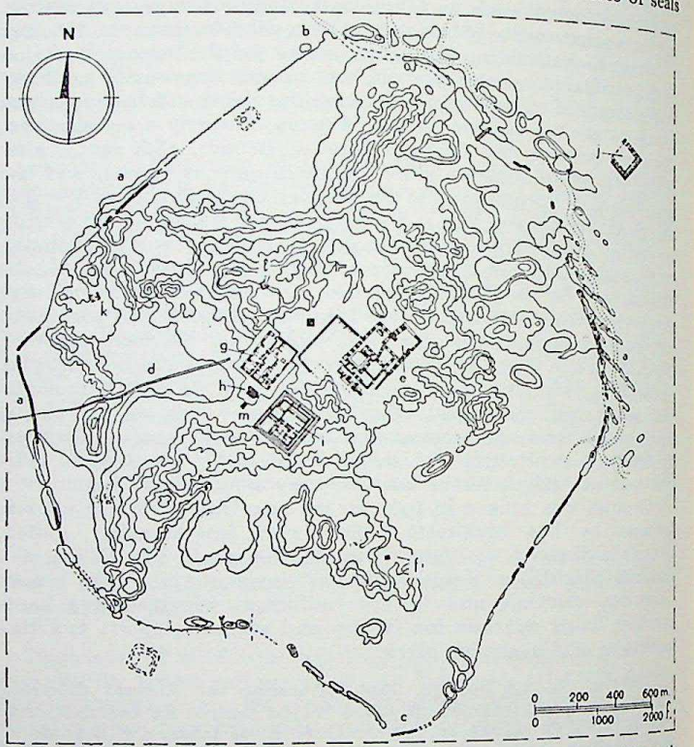
Ḥājj Muḥammad. Site on the Euphrates, not far from Khidr, where excavations in 1936–37 brought to light early chalcolithic painted pottery of a period later than the so-called "Ḥājj Muḥammad" or "Eridu" pottery of Tell Halaf.

BIBLIOG. A. Nöldeke et al., Vorläufiger Bericht über die von der Notgemeinschaft der deutschen Wissenschaft in Uruk-Warka unternommen Ausgrabungen, IX, 1938, pp. 37–38, pls. 36–40, X, 1939, p. 4, XI, 1940, pp. 26–28, pls. 20 c–d (AbhPreussAk, 1937, II, 1939, 2, 1940, 3); C. Ziegler, Die Keramik von der Qal'a des Haǧǧi Moḥammed, Berlin, 1953.

Erech (Uruk, mod. Warka). The earliest finds, dating from the middle chalcolithic period, are terra cottas and pottery from levels XVIII–XIV, discovered after deep soundings were made in the "limestone temple." Attributed to the periods immediately following — the late al-'Ubaid and Uruk — are levels XII–VIII, which have yielded specimens of pottery from the last phase of al-'Ubaid and Uruk and some seal impressions; the oldest stamp seal in southern Mesopotamia was found in level XII. From the protohistoric period, designated by levels VI–IV of the sacred precinct of E-anna as a common cultural phase, are a number of religious structures: Temple A, the "limestone temple," the hall of columns, and the court of mosaic half columns (X, PL. 172), all from level V–IVb; and temples C and D from level IVa. Also from level IVa come numerous seal impressions and the earliest written documents. The temple on a high terrace of level III of E-anna in the three subsequent phases attested by the corresponding levels, and level B (the "White Temple"; I, FIG. 859; IX, PL. 463) of the ziggurat of Anu date from the Jamdat Naṣr epoch. There was also during this period a remarkable development of sculpture in high relief, low relief, and in the round, utilizing clay, stone, metal, and a combination of various materials; outstanding examples are the head of a woman (IX, PL. 464), the Lion-Hunt Stele, and a large alabaster vase (IX, PL. 466), all now in the Iraq Museum in Baghdad. Levels II–I of E-anna range from the end of the Jamdat Naṣr period to the Mesilim era, with discoveries of seals



Erech (Uruk), plan. Principal monuments: (*a*) Remains of walls; (*b*) north gate; (*c*) Gate of Ur; (*d*) street; (*e*) E-anna; (*f*) temple from Parthian period; (*g*) sanctuary with temple of Anu and Antum (Bīt Rēsh); (*h*) ziggurat with the "White Temple"; (*i*) sanctuary of Ishtar and Nannar (Irigal); (*j*) sanctuary of the festivals of Anu and Ishtar (Bīt Akītu); (*k*) ruins of the palace of Sin-Gashid; (*l*) houses of the protodynastic period; (*m*) Mithraeum of the Roman period.

and steatite vases in relief; dating from the Mesilim period are the city walls in plano-convex brick. Sublevels 4–1 of level I, which go back to the age of the 1st dynasty of Ur, yielded the upper portion of a male figure in stone, bearing the name of Lugalkisalsi. The ziggurat is largely the work of Ur-Nammu and his son Shulgi (Dungi), kings of the 3d dynasty of Ur; from this period date a head of a male statuette, jewels of the priestesses Dabbatum and Abbabashti, and figures from the foundation of the temple tower. There are few vestiges of the palace of Sin-Gashid, of the Old Babylonian period. Among the remains from the Kassite age are the temple dedicated to Inanna by King Karaindash, with the original frieze of deities on the façade (VII, PL. 356); a few terra cottas; and a votive stele erected by Nazimaruttash. The temple of Ningizzida and the group of religious structures known as the "southern building" are from the Neo-Babylonian period; a stele, perhaps of King Marduk-apaliddina II, is contemporaneous.

Badtibira. Mentioned in texts as the seat of a "pre-Flood" dynasty. Entemena, ruler of Lagash, is said to have built a temple to Dumuzi and Inanna here. V. E. Crawford has convincingly identified the site with Tell Madineh.

Bibliog. V. E. Crawford, The Location of Bad-Tibira, Iraq, XXII, 1960, pp. 197–99.

Urukug (mod. el-Hibba). Perhaps part of Lagash. Uncovered here was a sacred building from the time of the 1st dynasty of Ur — a type of elevated temple, erected on an oval terrace, like those in Khafaje and in al-'Ubaid.

Bibliog. R. Koldewey, Die altbabylonischen Gräber in Surghul und El Hibba, ZfAssyr, II, 1887, pp. 403–30; R. Koldewey, Die Tempel von Babylon und Borsippa, Leipzig, 1911, p. 61; W. Andrae, Das Gotteshaus und die Urformen des Baues im alten Orient, Berlin, 1930, p. 4, fig. 2; P. Delougaz, The Temple Oval at Khafājah (Univ. of Chicago, O. Inst. Pub., LIII), Chicago, 1940, pp. 143–44.

Telloh (anc. Lagash). Seals from the epoch of Jamdat Naṣr are the earliest objects discovered here. A figure with plumed headdress from the Jamdat Naṣr-Mesilim transitional period, is of special interest for its graphic detail (IX, pl. 467). A ritual spearhead of a king of Kish and a famous votive mace date from the Mesilim period (IX, pl. 470). In the style of the 1st dynasty of Ur are important monuments of the *ensi* (governors) of the city; various statuettes (IX, pl. 474); plaques of Ur-Nina (I, pl. 502), Eannatum, and Dudu (IX, pl. 475); the famous Stele of the Vultures of Eannatum (I, pl. 506); the silver vase of Entemena (I, pl. 504); nails from a foundation; and seals. From the Akkadian period come fragments of a triumphal stele, perhaps King Rimush's (VII, pl. 252), of excellent workmanship, and an inscribed votive tablet of Naram-Sin, as well as seals. Lastly, a group of interesting objects is associated with the name of Gudea; these include cylinders bearing inscriptions concerning the ritual of the temple consecration; a number of statues, both seated and standing, of the princes of the city (I, pl. 511; VII, pl. 356; IX, pl. 472); many stele fragments; stone votive tablets; and libation vases (IX, pl. 481). Also deserving mention are a headless statue (IX, pl. 479) and an extremely expressive bust of Ur-Ningirsu, son of Gudea. The supposed hypogeum of Gudea's successors, from the beginning of the 3d dynasty of Ur, today is believed to be a complex of aqueducts.

Jacobsen, La géographie et les voies de communication du pays de Sumer, Rev. d'assyriologie, LII, 1958, pp. 127–29.

Umma (mod. Jokha). A large number of interesting sculptures were found here, including an alabaster male statuette from the Mesilim epoch, the upper portion of a female figure from the 3d dynasty of Ur, and a votive slab of Sharatiqubisin from the same period.

Bibliog. G. Contenau, Musée du Louvre: Les antiquités orientales, I, Sumer, Babylonie, Elam, Paris, 1927, pl. 10; H. Frankfort, Sculpture of the 3d Millennium B.C. from the Diyala Region (Univ. of Chicago, O. Inst. Pub., XLIV), Chicago, 1939, pl. 115 E.

Fara (anc. Shuruppak). The earliest discoveries consist of items from the Jamdat Naṣr period: stone vases in relief, painted pottery, cylinder and stamp seals, and a vase stand. From the Jamdat Naṣr-Mesilim transitional period there are a few typical seal impressions with the so-called "false writing"; there are also numerous seals and impressions from the Mesilim epoch, with rather complex arrangements of motifs and a bold abstraction of the human figure (IX, pl. 496). A number of votive steles in relief date from the time of King Mesilim. Several important seal impressions of Imdugud-Sukurru from the Mesilim-Ur I transitional period have given their name to this period.

Bibliog. E. Heinrich and W. Andrae, Fara: Ergebnisse der Ausgrabungen der Deutschen Orient-Gesellschaft in Fara und Abu Hatab 1902–1903, Berlin, 1931, pp. 8–136.

Abū-Ḥaṭab (anc. Kisurra). Site east of Kish, where German excavations have brought to light cylinder seals and terra cottas from the early Babylonian period.

Bibliog. E. Heinrich and W. Andrea, Fara: Ergebnisse der Ausgrabungen der Deutschen Orient-Gesellschaft in Fara und Abu Hatab 1902–1903, Berlin, 1931, pp. 137–53.

Bismaya or Bismiya (anc. Adab). Dating from the Jamdat Naṣr-Mesilim transitional period are fragments of steatite vases carved in relief. From the period of the 1st dynasty of Ur there are many tombs, a statuette of Lugaldalu, and a seated, headless limestone figure. The city is assumed to have been especially flourishing at the time of the Akkadian dynasty, as shown by the numerous discoveries from that period: a palace, the temple of Ishtar restored by Naram-Sin, private residential quarters, and a cemetery, as well as cylinder seals and two pieces of great interest — a golden tablet with an inscription of Naram-Sin and a very fine male head of alabaster (Chicago, University, Oriental Inst.). As evidence of the building activity of the rulers of the 3d dynasty of Ur, bricks bearing the name of Shulgi were found in the ziggurat. Also noteworthy is a statue of a seated goddess from this same period.

Bibliog. R. F. Harper, Report from Bismya, Am. J. of Semitic Lang., XX, 1903–04, pp. 207–08, 260–68; E. J. Banks, Bismya, or the Lost City of Adab, New York, 1912; G. Furlani, EAA, s.v. Adab, I, 1958, p. 62.

an-Najaf (anc. Mashhad 'Alī). Like Karbala, this site is one of the most important Shiite shrines in Iraq. The shrine was built over the presumed tomb of 'Alī ibn-abī-Ṭālib (I, pl. 12), in the vicinity of ancient Kufa (about 60 miles southwest of Baghdad). The site, held in extreme veneration by devout Shiites, has undergone destruction and alteration over the centuries, and so the present monuments are the result of many restorations and additions. The dome of the shrine, gilded in the 18th century, is its most outstanding feature. Like the shrine at Karbala, this monument has been insufficiently studied, because of the difficulty of access for non-Shiites.

Kufa. Unlike its twin, Basra (where, however, nothing remains of the ancient era), this Arab metropolis of Iraq has completely disappeared, even to its name, having been replaced by the smaller city of al-Hilla. In recent times, soundings and preliminary excavations have been undertaken here which have produced encouraging results and deserve to be continued.

Bibliog. D. T. Rice, The Oxford Excavations at Hira, 1931, Antiquity, VI, 1932, pp. 276–91.

Nippur (mod. Nuffar or Niffer). Sacred structures, including a temple of Inanna from level IX, have been identified as dating from the Mesilim period; other contemporaneous levels have yielded an interesting statuette and votive slabs in relief. Belonging to the period of the 1st dynasty of Ur are a temple of Inanna from level VIII, various sculptures in the round, and votive slabs in relief. The name of the Akkadian ruler Naram-Sin appears on bricks in the city walls and in the ziggurat of Enlil. Stone vases with inscriptions of Rimush, Manishtusu, and Naram-Sin have been discovered. The most noteworthy discoveries from the age of the Sumerian renaissance are: terra cottas; statuettes, from the foundation, of human figures terminating in the shape of a nail; a diorite fragment of a man carrying a lamb; a head of Gudea; a male torso; and a seated clay statuette. Ur-Nammu also left traces of his building activities at Nippur, in the ziggurat and the temple of Inanna. Dating from the successive early Babylonian, Kassite, and Chaldean periods are the continuous restorations and enlargements of the temple of Inanna, as well as some terra cottas and seal impressions. Of paramount importance is the abundant epigraphic material found at Nippur.

Birs Nimrud (anc. Borsippa; Barsippa). Still in evidence are the ruins of two important Neo-Babylonian structures, the ziggurat and the E-zida, a temple of Nabu with a vast court and three main cellae. The ruins of the wall that enclosed the consecrated area have also been found.

Tell el-Oheimir and Tell Ingharra (anc. Kish). A small stone relief, with a scene of a ritual taking place before a temple, and a few cylinder seals date from the period of Jamdat Naṣr. The palace, built of plano-convex brick, dates from the Mesilim period; it yielded a mosaic frieze, a figured pedestal in copper, and cylinder seals and seal impressions. A headless alabaster statue and a female head date from the period of the 1st dynasty of Ur. Structure Z on Tell Ingharra and a number of private dwellings belong to the Akkadian epoch; discoveries from this period include male alabaster heads and a fragment of a votive tablet. West of Tell el-Oheimir, the houses and schools for scribes are contemporaneous with the 1st dynasty of Babylonia. On Mound Z stood the ziggurat of Zababa, mainly the work of the kings of the Neo-Babylonian period; these rulers also built, in its final form, the temple on Mound D. Excavations on Mound H of Ingharra have brought to light the Sassanian quarter, with three large groups of buildings, and reliefs, busts, coins, and pottery.

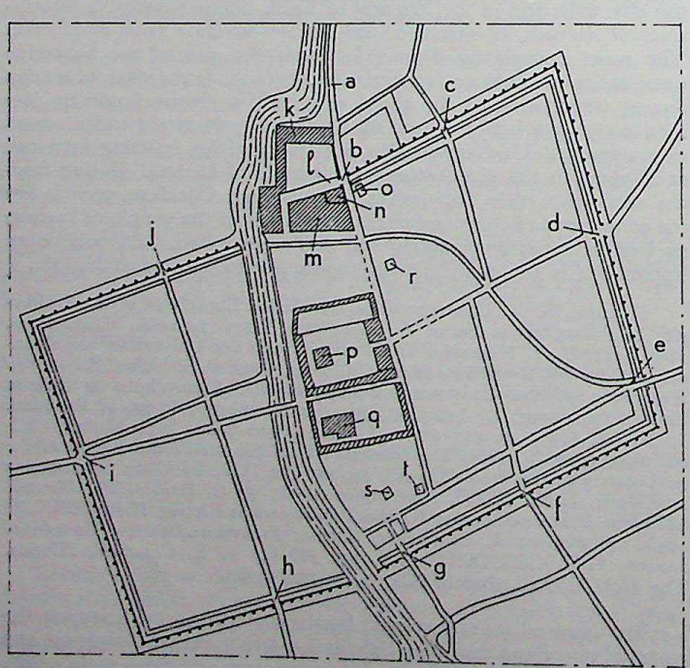
Babylon (Ka-dingir-ra, Bāb-ilu, Βαβυλών, mod. Tell Bābil). The earliest object found at Babylon is the statue of Puzur-Ishtar (IX, pl. 485) from the "museum" where Nebuchadnezzar collected objects from various epochs. From the age of Hammurabi and his dynasty, when Babylon was the capital of the empire, only the ruins of civil buildings and terra cottas have come to light in the modern district of Merkes; there, too, houses from the Kassite age, a number of tombs, a few cylinder seals, and the *kudurru* (boundary stone) of King Marduknadinakhe have been found. But the monuments that made Babylon a great city were built (or rebuilt) in the Neo-Babylonian period. The most important urban structures stood west of the Euphrates, close to its banks at that time. An outer wall, consisting of two juxtaposed walls, built by Nebuchadnezzar, started north of that king's palace and descended southeasterly, then turned sharply toward the southwest, extending for about 11 miles. At some distance inside, there was another wall — added to by several kings — also consisting of two juxtaposed walls (Imgur-Enlil and Nimid-Enlil) that extended for about 5 miles. There were several gates in the latter wall, the most important, to the north, being the Ishtar Gate (IX, pl. 494). It was decorated by Nebuchadnezzar with enameled blue brick, on which were arranged rows of reliefs of dragons, bulls, and sacred animals, in alternation; present calculations are that there were 30 rows of such reliefs. Through the Ishtar Gate passed the great processional way which, skirting the sacred precinct, led to the temple of Marduk. The temple was flanked, for a length of about 1000 ft., by walls roughly 25 ft. thick, which were also decorated with glazed blue brick bearing figures of lions. Like the reliefs on the Ishtar Gate, the decoration was surrounded by rows of white rosettes. However it may have been arranged originally, the processional way, in its final form, which was the work of Nebuchadnezzar, ascended beyond the temple. West of the Ishtar Gate, still outside the walls, stood the northern fortress and the main fortress, which was converted into a museum, according to documents found there from many different periods. On the same side, but inside the walls, was the important complex of the southern fortress, largely the work of Nabopolassar and Nebuchadnezzar. The building (about 1,050×625 ft.) consisted of five sections, each containing a central courtyard surrounded by halls and rooms. In the northeast corner, on high terraces supported by vaults, were the famous "hanging gardens" planted by Nebuchadnezzar, which contributed so much to the city's fame in antiquity. Opposite the southern fortress, on the other side of the processional road, stood the temple of Ninmakh, built by Ashurbanipal and restored by Nebuchadnezzar; to the south, on the same side, lay the great rectangular sacred precinct. To the eastern side of it, two large structures, used for stores and warehouses, flanked the main gate; to the south, other buildings housed the priests. Within the rectangle, westward, rose the vast and famous ziggurat called E-temen-an-ki, with a square base of about 300 ft. on each side, on which stood seven successive stories of decreasing size. A triple stairway gave access to the upper floors. In the southern part of the sacred precinct was the temple of Marduk, measuring about 260×280 ft. at the base, joined directly to another building (the "eastern building") which was even larger (about 295×380 ft.). The E-sagila had a central court, with surrounding chapels; of these, the principal one was that dedicated to Marduk, containing the statues of the god and his consort Sarpanitum. Southeast of the E-sagila stood two more temples: one called Temple Z by Koldewey, and the E-patutila, built by Nabopolassar in honor of Ninurta and restored by Nebuchadnezzar. The private quarters of the city were in the district now known as Merkes. The ruins of many dwellings were found there; these were of the usual type with central courtyard and with the characteristic saw-tooth façades. Many thousands of objects were found in the houses and tombs of this quarter.



Babylon, plan. (*a*) Processional way; (*b*) Ishtar Gate; (*c*) Sin Gate; (*d*) Marduk Gate; (*e*) Zababa Gate; (*f*) Enlil Gate; (*g*) Urash Gate; (*h*) Shamash Gate; (*i*) Adad Gate; (*j*) Lugalgirra Gate; (*k*) northern fortress; (*l*) main fortress; (*m*) southern fortress; (*n*) "hanging gardens"; (*o*) temple of Ninmakh; (*p*) E-temen-an-ki; (*q*) temple of Marduk (E-sagila); (*r*) temple of Ishtar; (*s*) Temple Z; (*t*) temple of Ninurta.

Bibliog. R. Koldewey, Die Tempel von Babylon und Borsippa, Leipzig, 1911; R. Koldewey, Das Ischtar-Tor in Babylon, Leipzig, 1918; O. Reuther, Die Innenstadt von Babylon (Merkes), Leipzig, 1926; F. Schmidt, and A. Mallwitz, Das Babylon der Spätzeit, Berlin, 1957; G. Furlani, EAA, s.v. Babilonia, I, 1958, pp. 954–56.

Karbala (anc. Mashhad Ḥusayn). Large and very important shrine of the Shiite sect, built on the site of the supposed tomb of al-Ḥusayn (Husain), son of ʿAlī ibn-abī-Ṭālib; al-Ḥusayn, died in 680 in Karbala. Like an-Najaf, Karbala has undergone drastic alterations and additions. The Sanctuary of al-Ḥusayn is a building with a central dome (I, pl. 5), a double minaret at the entrance, and extremely rich ceramic decoration on the façade. A third minaret (al-ʿAbd) rises on the eastern flank of the court which is enclosed by the sanctuary.

Bibliog. A. Nöldeke, Das Heiligtum al-Husains zu Kerbelā, Berlin, 1909; A. Honigmann, E. of Islam, s.v. Meshhed Ḥusain, III, Leiden, London, 1932, pp. 477–79.

Jamdat Naṣr (Jemdet Naṣr). The excavations conducted here revealed a hitherto unknown phase of Mesopotamian protohistory. A structure made of *Riemchen* brick dates from the period named after this site. Pottery with painted geometric patterns — or, in a few cases, with animal designs (IX, pl. 416) — stamp seals, and, especially, typical cylinder seals, decorated with rows of animals, are some of the characteristic discoveries of this time and region.

Bibliog. S. Langdon, Pictographic Inscriptions from Jemdet Nasr (Oxford Ed. of Cuneiform Texts, VII), Oxford, 1928; E. Mackay, Report on Excavations at Jemdet Nasr, Iraq, Chicago, 1931; H. Field and R. A. Martin, Painted Pottery from Jemdet Nasr, Iraq, AJA, XXXIX, 1935, pp. 310–20, pls. XXX–XXXVIII.

Tell ʿUqayr. The ruins of middle chalcolithic dwellings were discovered near this settlement, which is located about 40 miles

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

south of Baghdad. Of extreme interest are the fragments of paintings, with geometric and figural motifs, that once adorned the so-called "Painted Temple" in the level corresponding to the Jamdat Naṣr period. The sanctuary stood on an oval terrace.

Bibliog. S. Lloyd and F. Safar, Tell Uqair, JNES, II, 1943, pp. 132–58, pls. 1–31.

Central Iraq. Seleucia (Σελεύκεια, Tell 'Umayr). Site whose identification with the Sumerian Akshak is uncertain and which is made up of four levels of a late period, ranging from the Seleucid to the Parthian eras. Here pottery, figurines, and coins have been found, and public buildings (palaces, temples, and theaters) as well as private homes have been uncovered. The only Sumerian vestiges are two royal inscriptions from the 3d millennium.

Bibliog. L. Waterman, Preliminary Report upon the Excavations at Tell Umar, Iraq, Ann Arbor, 1931; L. Waterman, Second Preliminary Report upon the Excavations at Tell Umar, Ann Arbor, 1933.

Ctesiphon (Κτησιφῶν, mod. Ṭāq-i-Kisrā). Capital of the Sassanian kingdom; today a field of ruins dominated by the remains of the immense arch of the palace of Shāpur I. Of the great complex of buildings, there remains only a part of the façade and of the south wing. During the excavations stuccoes from the rich decoration were found, as well as pottery and coins of the Sassanian period.

Bibliog. O. Reuther, Die Ausgrabungen der deutschen Ktesiphon-Expedition im Winter 1928–1929, Berlin, 1930; E. Weidner, Ausgrabungen: Ktesiphon, AfO, V, 1928–29, p. 188, VIII, 1932–33, pp. 331–32; E. Kühnel, Die Ausgrabungen der zweiten Ktesiphon-Expedition, 1931–1932, Berlin, 1933; E. Kühnel, EAA, s.v. Ctesifonte, II, 1959, pp. 964–66.

Abū-Ḥabba (anc. Sippar). A great many fragments of stone vases and statues inscribed with the names of Rimush and Manishtusu have been found here, but so far the excavations have not turned up any vestiges of the Akkadian age. Sippar is known from texts as the original site of the magnificent victory stele of Naram-Sin (I, pl. 507), which was later carried to Susa as war booty and rediscovered there. Dating from the early Babylonian period are several houses with schools for scribes and some excellent terra cottas. Dating from the Neo-Babylonian period is the noteworthy *kudurru* of Nebuchadnezzar I (Br. Mus.), and dating from the mid-9th century B.C., a tablet with stone reliefs of Nabupaliddina (IX, pl. 495). The ziggurat and connecting temple were built by Nabonidus.

Bibliog. V. Scheil, Une saison de fouilles à Sippar (Mém. pub. par les membres de l'Inst. fr. d'archéol. o. du Caire, I), Cairo, 1902; L. W. King, Babylonian Boundary-stones and Memorial Tablets in the British Museum, I, London, 1912, pp. 29–36, II, London, 1912, pls. 83–91; W. Andrae and J. Jordan, Abu-Habbah – Sippar, Iraq, I, 1934, pp. 51–59.

Akkad. Site known from texts as the capital of the Akkadian kingdom. Up to the present it has not been identified definitely, although S. Langdon in the 1920s identified the city with the ruins of Der, a few miles north of Sippar and southwest of Baghdad. The most recent investigations at Der were made by T. Baqir in 1941, when doubt was once more cast on this identification, especially since early Babylonian material was found in the area. The assumption is that in the immediate vicinity of Sippar, a city dedicated to the god Shamash, there was another city of Sippar, dedicated to Ishtar-Anunitum, which was separated from Sippar only by a canal and had been built over the site where Akkad had stood earlier. This hypothesis has not yet been verified by any discovery. In any case, it is certain that in Nabonidus' time the two cities were not identical. It is known from texts only that Sargon of Akkad transferred his residence to Akkad, enlarged it, and made it into a port, so that ships bearing goods from the Persian Gulf could enter the Euphrates directly and sail up the river to the pier. Hence Akkad must have been located in antiquity on the banks of the Euphrates, or perhaps it may have been linked to the river by a canal. Besides this, it is also known that the famous torso of a diorite statue of Manishtusu was captured as war booty by the Elamites and later moved from Akkad to Susa.

Bibliog. S. Langdon, Excavations at Kish, I: 1923–1924, Paris, 1924, p. 7 n. 1; Reallexikon der Assyriologie, s.v. Akkad, I, Berlin, Leipzig, 1928, p. 62; T. Baqir and M. A. Mustafa, Iraq Government Soundings at Dēr, Sumer, I, 1945, pp. 37–54; E. Weidner, Das Reich Sargons von Akkad, AfO, XVI, 1952–53, pp. 1–24.

Der. Two tells, separated by a valley, cover the ruins, which have yielded potsherds from the Kassite period. Still visible today are the ruins of the ancient city walls, which S. Langdon sought to identify in 1924 as Akkad, capital of Sargon's empire. Only one gate in the walls, on the southwestern flank, has been positively identified.

Bibliog. S. Langdon, Excavations at Kish, I: 1923–1924, Paris, 1924, pp. 7–8; T. Baqir and M. A. Mustafa, Iraq Government Soundings at Dēr, Sumer, I, 1945, pp. 37–54; A. Parrot, Archéologie mésopotamienne, I: Les étapes, Paris, 1946, pp. 328–29.

Ishchali. Site about 3 miles southeast of Khafaje, where excavations by the Oriental Institute of the University of Chicago have brought to light buildings from the Isin-Larsa period, a temple of Ishtar-Kititum, a temple of Shamash, and private houses. Of interest are a number of terra cottas, cylinder seals, a male head, and bronze figurines, all material from the early 2d millennium B.C., found in the later levels of the temples mentioned above.

Bibliog. H. Frankfort, Progress of the Work of the Oriental Institute in Iraq, 1934–1935: Excavations at Ishchali and Khorsabad, O. Inst. Comm., XX, 1936, pp. 74–100; H. Frankfort, More Sculpture from the Diyala Region (Univ. of Chicago, O. Inst. Pub., LX), Chicago, 1943, pp. 20–21, pls. 73 no. 333, 74, 77–81; H. Frankfort, Stratified Cylinder Seals from the Diyala Region (Univ. of Chicago, O. Inst. Pub., LXXII), Chicago, 1955, pls. 86–89.

Khafaje. The oldest structure is the so-called "Temple of Sin" on Mound A, levels I–IV of which date from the time of Jamdat Naṣr. Also from the same period are a female statuette, animal-shaped libation goblets of clay, stone vases, pedestals with relief ornamentation, cylinder seals, and specimens of painted pottery. In the Jamdat Naṣr-Mesilim transitional period, the Temple of Sin was enlarged (levels VI–VII), while the "small temple" and temple of Nintu were erected in five successive stages, corresponding to an equal number of strata. Of particular interest is a steatite vase with relief decoration; pottery called "scarlet ware" and two seals in "brocade style" are characteristic discoveries. During the Mesilim period additions were made to the Temple of Sin (levels VIII–IX), to the temple of Nintu (levels V–VI), and to the "small temple" (levels VI–VIII), and the "oval temple" — so called from the shape of the temenos — was built; subsequent enlargements of this important complex and the level of the "small temple" date from the period of transition to the 1st dynasty of Ur. The third phase of the "oval temple" and a small, single-celled shrine date from the period of the 1st dynasty of Ur. Cylinder seals of the periods ranging from the Mesilim to the Akkad epochs were found, as well as excellent stone and bronze figurines in an attitude of prayer, and votive slabs in relief. Of later date — from the old Babylonian period — are the ruins of a small city appearing on mounds B and C, as well as a great many terra cottas (IX, pl. 485).

Bibliog. H. Frankfort, Sculpture of the Third Millennium from Tell Asmar and Khafajeh (Univ. of Chicago, O. Inst. Pub., XLIV), Chicago, 1939, pls. 28–41, 45–61, 64–69, 71–92, 98–105, 107–114; P. Delougaz, The Temple Oval at Khafaje (Univ. of Chicago, O. Inst. Pub., LIII), Chicago, 1940, p. 112, fig. 103, pls. 3–5, 7, 11; P. Delougaz and S. Lloyd, Pre-Sargonid Temples in the Diyala Region (Univ. of Chicago, O. Inst. Pub., LVIII), Chicago, 1942, pp. 18, 29–30, 37, 69, 104, figs. 14, 25, 33, 63, 98, pls. 2–12, 15–17; H. Frankfort, More Sculpture from the Diyala Region (Univ. of Chicago, O. Inst. Pub., LX), Chicago, 1943, pls. 1–27, 46–51, 54; P. Delougaz, Pottery from the Diyala Region (Univ. of Chicago, O. Inst. Pub., LXIII), Chicago, 1952, pp. 60–72, pls. 1–10, 13–16; H. Frankfort, Stratified Cylinder Seals from the Diyala Region (Univ. of Chicago, O. Inst. Pub., LXXII), Chicago, 1955, pls. 72–85.

Tell Agrab. The Shara temple found here was frequently rebuilt; its earliest level, not yet excavated, dates from the Jamdat Naṣr period. The level most remarkable — both for the size which the sanctuary attained at that time and for the objects discovered there — is that of the Mesilim epoch, a period from which the city walls also date. Later construction in the temple area dates from the period of the 1st dynasty of Ur. The earliest objects discovered here are stone vases decorated with figures in high relief and cylinder seals from the Jamdat Naṣr period. In levels of the Jamdat Naṣr-Mesilim transitional period, steatite vases with reliefs, cylinder seals, and so-called "scarlet ware" were found. During the Mesilim period and in the time of the 1st dynasty of Ur, great advances were made in sculpture in the round and in relief; some valuable specimens are a small female head of a delicate, smooth appearance, a bronze draft cart, bronze vases on a base formed by the figures of two men embracing, statuettes of praying figures, and cylinder seals.

'Aqar Quf (anc. Dur Kurigalzu). Capital of the Kassite state, where discoveries were made of the ruins of the E-gi-rim ziggurat and of a complex of three temples to the east of the ancient capital. A mound of clay bricks — ruins of buildings also dating from the Kassite period — is located on Mound A. The Palace A complex, on Tell Abiad, is also important; its arrangement of courtyards differs from the usual Mesopotamian style. Fragments of a colossal statue of Kurigalzu, a number of fine clay figurines including a male head, and vestiges of wall paintings were found here, as well as specimens of Nuzi pottery.

Bibliog. T. Baqir, Iraq Government Excavations at 'Aqar Qūf, Iraq, VI, 1944, Sup., pp. 1–15, VII, 1945, Sup., pp. 1–15, VIII, 1946, pp. 73–93; G. Furlani, EAA, s.v. 'Aqar Quf, I, 1958, pp. 509–10; T. Baqir, 'Aqar Quf, Baghdad, 1959.

Tell Harmal (anc. Shaduppum?). A hill about 6 miles east of Baghdad. Excavations begun here in 1945 have turned up two double temples dating from the early 2d millennium B.C., the larger one dedicated to Nisaba and Khani. Life-size terra-cotta lions come from the sanctuary of Nisaba.

Bibliog. T. Baqir, Tell Harmal: A Preliminary Report, Sumer, II, 1946, pp. 22–30, pls. 1–3; B. A. van Proosdij, Van Stedeling tot tentbewoner, Jaarbericht Ex Oriente Lux, X, 1945–48, pp. 537–60 at 538, pls. 29–30; T. Baqir, Tell Harmal, Baghdad, 1959.

Tell el-Dhiba'i. Recent excavations have exposed a temple of the old Babylonian period in level V, corresponding to the level of Tell Harmal. Terra cottas of this same period have also been found.

Bibliog. M. A. Mustafa, Soundings at Tell al Dhiba'i, Sumer, V, 1949, pp. 173–97.

Tell Asmar (anc. Eshnunna). A very important archaeological site in the Diyala region, where an American expedition under the direction of H. Frankfort has brought to light two interesting groups of buildings. The earlier comprises the temple of the god Abu. The first religious structure of this group dates back to the Jamdat Naṣr period and has a single cella; subsequently a number of alterations were made that correspond to levels I–IV of the Jamdat Naṣr-Mesilim transitional period, until, in the Mesilim period, the sanctuary acquired the characteristic rectangular form. At the time of the transition to the 1st dynasty of Ur, the temple was reconstructed and, finally, in the Akkadian period, the structure was entirely rebuilt. The other monumental center consisted mainly of a royal palace built by Ilushuilia, *ensi* of Eshnunna, who also built the adjacent temple dedicated to Shu-Sin (Gimil-Sin), deified king of the 3d dynasty of Ur. After the epoch of the 3d dynasty of Ur, the palace underwent slight alterations at the hands of Nurahum and Bilalama, contemporaneous princes of the dynasties of Isin and Larsa. During the Old Babylonian period, under the *ensi* Ibiq-Adad II, the "southern building" — whose function is uncertain — and the "northern building" — thought to be an audience chamber — were built. A great many seals have been found, along with specimens of the characteristic "scarlet ware," votive slabs, statuettes — some from the "square temple" of Abu dating from the Mesilim period (I, pl. 501) — and a number of fine terra cottas (IX, pl. 485).

Bibliog. H. Frankfort, Sculpture of the Third Millennium from Tell Asmar and Khafajeh (Univ. of Chicago, O. Inst. Pub., XLIV), Chicago, 1939, pls. 1-27, 62–63, 93, 97, 106, 110, 112; H. Frankfort, S. Pub., LXXII), Chicago, 1955, pls. 42-71.

Northern Iraq. Samarra. Discoveries have been made here, from the early chalcolithic period in one level, of painted pottery decorated with realistic and geometric motifs in a circular rhythm. This pottery, found together with alabaster vases and stone utensils, is important evidence of the succession of cultures in the Mesopotamian valley. The imposing ruins of the Abbasside "Versailles" on the Tigris (residence of the caliphs from 838 to 889) have been excavated and studied in several expeditions led by E. Herzfeld. Preeminent among the structures from the Moslem period is the Great Mosque of al-Mutawakkil (built 846–52), once capable of containing over 100,000 of the faithful; the flat roof rested upon octagonal masonry piers with engaged marble columns. Outside the enclosing wall stands the lofty minaret of "al-Malawiya" (the spiral; I, pl. 11), a tower with an external spiral ramp, of local Mesopotamian inspiration, which in turn inspired Tulunid architecture in Egypt. A less important mosque is that of Abū-Dulaf. The most important ruins of secular buildings are those of the caliph's palace (Jausaq al-Khāqānī) and of the Balkuwāra palace (pl. 151), patterned after the Lakhmid palace in Hira, as well as the Qaṣr al-'Ashiq ("Lovers' Castle") on the western bank of the river. Near these monumental buildings are many private houses, decorated with niches, paintings, and stucco ornament (I, pl. 4). The pottery found here is abundant and important (I, pl. 8).

Bibliog. E. Herzfeld, Die Ausgrabungen von Samarra, V: Die vorgeschichtlichen Töpfereien von Samarra, Berlin, 1930; E. Herzfeld, Geschichte der Stadt Samarra, Hamburg, 1948.

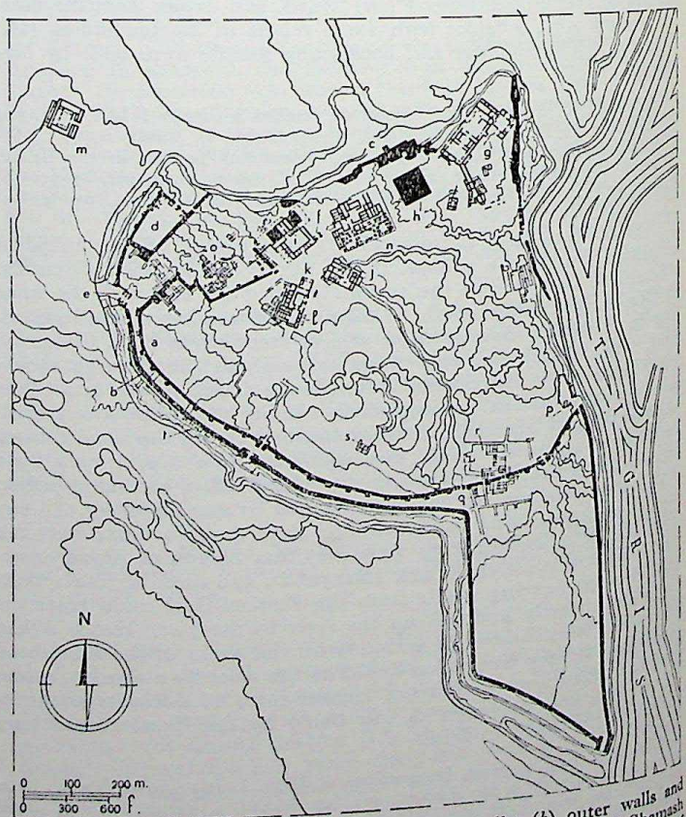
Matarra (Mattara) or Qara Yitagh. Prehistoric village that shows evidence of the passage from the Neolithic to the chalcolithic age in northern Mesopotamia. Ruins of houses with fragments of Hassuna pottery, clay figurines, utensils of bone and stone, and ornaments of shell and stone were discovered here.

Bibliog. R. J. Braidwood, Matarrah, JNES, XI, 1952, pp. 1–75.

Yorgan Tepe (anc. Nuzi). The earliest levels contain pottery of al-'Ubaid type and stamp seals from the Jamdat Naṣr period. The city first attained prominence in the Akkadian period; temples G and F and a number of houses remain from that era. Dating from the Hurrian period are Temple A, which has yielded many small ritualistic objects, and the palace of the viceroy or governor of the city, a contemporary of King Shaushattar. The palace has a large central court, halls, offices, and warehouses. Specimens of Hurrian pottery — painted in white, black, and red — as well as cylinder seals and fragments of wall paintings have been found.

Bibliog. R. F. S. Starr, Nuzi: Report on the Excavations at Yorgan Tepe near Kirkuk, Iras, 1927–1931, 2 vols., Cambridge, Mass., 1937–39.

Ashur (Assur; mod. Qal'at Sherqat). This great Assyrian city was circled by a ring of walls built in the 2d millennium and a later enclosure built by Shalmaneser III. Of the 13 gates mentioned in written sources, 7 have been identified. At the northeast end was the temple of the god Ashur, of which, besides the few ruins of the temple of Ilushuma, two phases of construction have been identified. The earlier building — erected by Shamshi-Adad I, a contemporary of Hammurabi — consisted of two courts preceding the antecella and the cella itself; this building was later restored, after a fire, by the rulers of the late 2d millennium and subsequently



Ashur, plan. Principal monuments: (*a*) Inner walls; (*b*) outer walls and moat; (*c*) Mushlālu Bastion; (*d*) outer bastion; (*e*) Gurgurru Gate; (*f*) Shamash Gate; (*g*) temple of Ashur; (*h*) ziggurat of Enlil and Ashur; (*i*) temple of Anu and Adad; (*j*) temple of Sin and Shamash; (*k*) temple of Ishtar; (*l*) temple of Ishtar and Nabu; (*m*) Bīt Akītu; (*n*) palace from the age of Akkad; (*o*) palace of Tukulti-Ninurta; (*p*) palace of Prince Ashurilumuballitsu, son of Sennacherib; (*q*) stele; (*r*) palace from the Parthian period; (*s*) private house of early Assyrian period; (*t*) tombs.

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

by Sennacherib, who added a court at the southeast corner. Southwest of the temple of Ashur was the ziggurat of Enlil, from the early 2d millennium, later dedicated to Ashur. Farther southwest was the double temple of Anu and Adad, of interest for its originality of design, with two ziggurats and two cellae, preceded by a single vast courtyard; it was erected by Ashurreshishi I and Tiglathpileser I, and restored and made smaller by Shalmaneser III. Another double temple was that of Sin and Shamash, consisting of a central courtyard and two cellae in axial opposition, each with an antecella preceding it; the sanctuary, built by Ashurnirari I, was restored and altered by several rulers, the last being Sennacherib, who erected the southeastern courtyard, opening up two new antecellae and displacing the axis of the group of structures. Levels H and G of the temple of Ishtar provide evidence of the ritualistic environment of the transitional period from the 1st dynasty of Ur up to the time of Akkad, from which votive reliefs (IX, PL. 487), cylinder seals (IX, PL. 496), and fragments of stone vases decorated in relief have been discovered; this sanctuary was rebuilt several times, the last time by Shalmaneser III. Another famous temple of Ishtar is the one built under Sin-sharishkun, with two courtyards and three cellae, one of which was dedicated to the god Nabu. Outside the city walls, on the western flank, Sennacherib built the sanctuary of the Bīt Akītu. In the city, the ruins of three palaces have been found: one dates back to the epoch of Akkad but was remodeled later; another was built by Tukulti-Ninurta I; and the third was built by Sennacherib for his son Ashurilumuballitsu. Outstanding among the discoveries here are a torso of a statue in diorite, a spearhead of Manishtusu, and a macehead of Rimush from the Akkad dynasty; a male statue in stone, a bronze female figure, a votive slab of Zariqum, and a large number of seal impressions from the period of the 3d dynasty of Ur (IX; PL. 496); and a ritualistic relief and specimens of Nuzi pottery from the middle of the 2d millennium. In the succeeding period, corresponding to the apogee of the Medean and Neo-Assyrian empire, the main discoveries, in addition to a large number of cylinder seals, are steles, some ivories, an altar of Tukulti-Ninurta I (VII, PL. 405) and a basalt statue of Shalmaneser III (Br. Mus.), and the sarcophagi of a number of Neo-Assyrian rulers discovered in the ancient palace. During the Parthian period the ziggurat of Ashur-Enlil constituted the heart of the fortress, at the foot of which stood two large structures. Also dating from the Parthian period is a palace among a group of buildings that was located near the southern gate.

Tulul al-ʿAqir (Kar-Tukulti-Ninurta). In this city, founded in the 13th century B.C. by the Assyrian ruler Tukulti-Ninurta I, was discovered an important cult center dedicated to the god Ashur. It consisted of a ziggurat and a lower temple backed against it on the eastern flank. An interesting wall painting with ornamental motifs comes from the royal palace.

BIBLIOG. W. Andrae, Farbige Keramik aus Assur, Berlin, 1923, pp. 7–11, pls. 1–4; W. Andrae, Das wiedererstandene Assur, Leipzig, 1938, pp. 92, 122, figs. 42–52, pl. 49b.

Hatra ("Ατρα or "Ατραι, Hatrae, al-Hadhr). A thriving city in the 2d century. The ruins of its powerful fortification walls, built of stone and strengthened by towers and bastions, are still visible. The walls were encircled by a deep moat. The official quarters, set off by a rectangular enclosure with the main entrance gate on the eastern flank, included in the western sector the palaces of the governors and a temple dedicated to Mithras. The ruins of private homes, with small altars for the domestic hearth and fragments of sculpture, have been found south of the main group of buildings (IV, PL. 171).

BIBLIOG. W. Andrae, Hatra, 2 vols., Leipzig, 1908–12; J. B. Ward Perkins, EAA, s.v. Hatra, III, 1960, pp. 1116–22.

Kirkuk (anc. Arrapkha). Hurrian seals and seal impressions from the middle of the 2d millennium B.C. have been found here.

BIBLIOG. G. Contenau, Les tablettes de Kerkouk et les origines de la civilisation assyrienne, Babyloniaca, IX, 1926, pp. 69–151, 157–212; G. Castellino, EAA, s.v. Arrapkha, I, 1958, p. 672.

Barda Balka. Site about 35 miles east of Kirkuk, where the earliest traces of the middle Paleolithic culture in Mesopotamia were discovered. Crude axes, stone chips used as weapons, stone utensils, and megalithic steles were found here.

BIBLIOG. Naji al Asil, News and Correspondence: Barda Balka, Sumer, V, 1949, pp. 205–06; R. J. Braidwood, Excavations in Iraqi Kurdistan, Sumer, VII, 1951, pp. 99–104; R. J. Braidwood, From Cave to Village in Prehistoric Iraq, BAmSOR, CXXIV, 1951, pp. 12–18; H. E. Wright and B. Howe, Soundings at Barda Balka, Sumer, VII, 1951, pp. 107–18.

Jarmo (Qalʿat Jarmo). Prehistoric settlement, located about 30 miles east of Kirkuk. Five levels from the late Mesolithic period have been discovered here. In levels XV–VI stone vases, but no pottery, have been found, plus a variety of utensils in obsidian, stone, and bone, as well as cult images, fertility symbols made of unfired clay, and bones of domestic animals. Levels V–I, however, have yielded clay vases with red glaze, in addition to cult images and utensils. Houses with foundations partly of stone have also been found.

BIBLIOG. L. S. Braidwood, The Jarmo Flint and Obsidian Industry, Sumer, VII, 1951, pp. 105–06; R. J. Braidwood, Excavations in Iraqi Kurdistan, Sumer, VII, 1951, pp. 99–104; R. J. Braidwood, The Iraq-Jarmo Project of the Oriental Institute of the University of Chicago, Sumer, X, 1954, pp. 120–38; R. J. Braidwood and B. Howe, Prehistoric Investigations in Iraqi Kurdistan, Chicago, 1960.

Karim Shahir. A settlement, dating from the dawn of the middle Mesolithic age, located about 1 mile west of Jarmo. Discoveries made here include stone utensils, beads, ornaments, rings, bone needles, clay figures, and bones of domestic animals.

BIBLIOG. R. J. Braidwood, From Cave to Village in Prehistoric Iraq, BAmSOR, CXXIV, 1951, pp. 12–18, figs. 1, 3, 4; R. J. Braidwood, Excavations in Iraqi Kurdistan, Sumer, VII, 1951, pp. 99–104; R. J. Braidwood, The Near East and the Foundations for Civilization, Eugene, Ore., 1953, p. 26, figs. 13, 16.

Hassuna. Site whose invaluable continuity of documentation for the late prehistoric epoch has cast light on the earliest chalcolithic period. The earliest level, Ia, is preceramic. In levels Ib–II, fragments of the archaic pottery named after Hassuna were found. Succeeding one another in the upper levels, although with interruptions, are the typical Hassuna, then Samarra, then Tell Halaf pottery, and, finally, pottery of the northern variety of al-ʿUbaid type.

BIBLIOG. S. Lloyd and F. Safar, Tell Hassuna, JNES, IV, 1945, pp. 255–89.

Sadawa (anc. Kakzu, Qaṣr Shamamok). On this site, the Italian archaeological mission of 1933 headed by G. Furlani brought to light the ruins of a fortification wall from the time of Sennacherib, other unidentified ruins from the Assyrian epoch, and a Parthian cemetery containing interesting sarcophagi with ceramic decoration.

BIBLIOG. G. Furlani, Ausgrabungen: Kakzu, AfO, IX, 1933–34, pp. 74–75; G. Furlani, Gli scavi italiani in Assiria, Giornale della Soc. asiatica it., II, 1934, pp. 265–76; G. Furlani, Sarcofaghi partici di Kakzu, Iraq, I, 1934, pp. 90–94; G. Garbini, EAA, s.v. Kakzu IV, 1961, p. 290.

Nimrud (anc. Kalakh). From the 2d millennium B.C. there are only cylinder seals and impressions and a building from the time of Shalmaneser I (13th cent. B.C.). Ashurnasirpal II engaged in intensive construction activities in the early 9th century B.C., as attested by a ziggurat on the northern summit of the tell of Nimrud; a double temple of Bel and Ninurta with the splay of the door adorned with animal figures; a stele of Ashurnasirpal II (Br. Mus.); two temples of Ishtar, patroness of the country, from one of which came the well-known statue of Ashurnasirpal II (Br. Mus.); the northwestern palace, with two courtyards, figures of animals in the splay of the doorway, and orthostats with reliefs (genii with a sacred tree, hunting and battle scenes; I, PL. 515). The temple of Nabu, too, in the southwestern area, was begun by this king. In the latter half of the 9th century B.C., Shalmaneser III probably saw to the maintenance and completion of the structures his father had had built; animals decorating the splay of the doorway, bearing his inscription, prove the beginning of work on the central palace, near which was also discovered his Black Obelisk (IX, PL. 488; X, PL. 144). Dating from the time of Adadnirari III (early 8th cent. B.C.) are statues of deities in the temple of Nabu and the so-called "upper chambers." In the latter half of the 8th century, Tiglathpileser III had construction work done on the central palace. Its orthostats in relief were incorporated early in the 7th century B.C. into the southwestern palace of his grandson Esarhaddon. The restoration by Ashuretililani — one of the last Assyrian rulers of the late 7th century — of the temple of Nabu and the surrounding area, the so-

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

called "southeastern palace," shows that Nimrud continued to be used as a capital. Southeast of the outer city walls of Kalakh, near the present double hill of Tulul el-'Azar, Shalmaneser III erected Fort Shalmaneser in the late 9th century. This was a series of structures apparently used as a barracks and storehouse for arms, wine, and war booty up to the time of Kalakh's destruction in 612 B.C. The most significant discoveries made here are fragments of wall paintings and objects of ivory (PL. 237; I, PL. 526).

Grai Resh. Vestiges of the late chalcolithic period were discovered here, attesting the dissemination in northern Mesopotamia of the al-'Ubaid culture. Examples of pottery from the age of Uruk and ruins of a house from this same period have also been discovered.

BIBLIOG. S. Lloyd, Iraq Government Soundings at Sinjar, Iraq, VII, 1940, pp. 13–21.

Balawat (anc. Imgur-Enlil). The renowned chased bronze revetment that once adorned the doors of the temple of the Assyrian kings Ashurnasirpal II and Shalmaneser III was found here. It is made up of long bronze sheets, ca. 11 in. high, with reliefs depicting such deeds of Shalmaneser III as the campaign in Phoenicia, the conquest of upper Syria, and the expedition to the source of the Tigris (IX, PL. 490).

Mosul (al-Mauṣil). The richest city of all Iraq in Moslem monuments. Of the earliest congregational mosque, from the Ommiad period, there remain the minaret and library, now transformed into the sanctuary of Sheik al-Shaṭṭ. Better preserved are the great Mosque of Nūr al-Dīn (12th cent. of the Christian Era) with a mihrab richly decorated with arabesques and inscriptions, in the center of the city, and a minaret of the Jāmi' al-Kabir with decorative bands of brick (I, PL. 6). On the site of the third major mosque, that of Mujāhid, there now stands the sanctuary of Khidr Ilyās. Many other sanctuaries, among them those of Nabī Jirjis and nearby Nabī Yūnus, are the result of adaptations and transformations during the Islamic period of earlier Christian buildings. Also worthy of note are the Mausoleum of Imam Yaḥyā (A.D. 1240), with brick ornamentation and plinths of arabesqued alabaster; the Mausoleum of 'Aun al-Dīn, which is cubical, with pyramidal ornamentation like that of the tomb of Zubayda in Baghdad; and the Mausoleum of Panjāh 'Alī. Of special interest also are the ruins of the Sultan's palace (Qara Saray), from the 13th century, with stucco decoration in ornamental and figural calligraphic motifs.

In the modern period Mosul has become a mercantile city, stretching along the right bank of the Tigris. Pillaged and destroyed in 1400 by the Mongols of Tamerlane, it declined under the Ottoman Empire. It was occupied by English troops in 1918 and became part of the British mandate until Iraq's independence in 1932. Among the monumental ruins are part of the city walls (destroyed by the artillery of Nādir Shah in 1743), and the Ottoman Fortress of Bash Tabia (partially collapsed as a result of landslides). More recent are the Mosque of Nabī Shith, in Turkish style, the Dominican convent, the Latin Church, the Archaeological Museum, and the Palace of Justice.

Nineveh (Ninua, Νινευή, Tell Nabī Yūnus, mod. Quyunjiq or Kuyunjik). The site has yielded a type of incised gray monochrome pottery, followed in the stratigraphy by shards of Samarra and Tell Halaf pottery from the early chalcolithic era. The periods of al-'Ubaid and Uruk are likewise documented by the remains of their characteristic pottery. The beautiful pottery of Nineveh from level V is of the Jamdat Naṣr-Mesilim transitional period, as are also the cylinder seals from level IV. A splendid bronze head, perhaps of Naram-Sin or Sargon (I, PL. 508), dates from the time of the Akkad dynasty. Among the discoveries ascribed to the Middle Assyrian period are a mutilated statue of a woman bearing an inscription of Ashurbelkala (IX, PL. 487), and a badly damaged obelisk, perhaps of the same ruler. The monuments of the Neo-Assyrian period are poorly preserved because of the violent conflagration of 612 B.C. and the rudimentary excavation methods of the first archaeologists. The northern palace has been identified as the residence of Ashurbanipal, while the southwestern one, which has yielded fragments of wall paintings, was built by Sennacherib. Reliefs of hunting scenes and animal life in the British Museum come from Ashurbanipal's palace (IX, PL. 493), and many cuneiform tablets come from its celebrated library. At the center of the sacred hill are the scant remains of the temples of Ishtar and Nabu, as well as the palace of Ashurnasirpal II. On the nearby tell of Nabī Yūnus are the ruins of a palace of Esarhaddon.

Arpachiya. The tholos structures and the Samarra and Tell Halaf pottery found in the deepest levels of this site are evidences of the early chalcolithic period; these levels also yielded amulets, terra-cotta female statuettes, and stamp seals. Pottery of al-'Ubaid I type, from the middle chalcolithic period, was also found here.

Khorsabad (anc. Dur Sharrukin). This is the capital which Sargon II of Assyria built for himself and which was dedicated shortly before his death in 705 B.C.; it was later abandoned by his successors. The area of the city was encircled by a wall with two gates on each side, except on the northwest, where the ruler's palace (I, FIG. 870) stood on a raised terrace with three entries opening onto a vast inner court, flanked by offices and service quarters. The king's apartments were farther to the northwest, grouped about a small courtyard, to the right of which was the great throne room. On the left flank of the residential group stood the characteristic ziggurat, in separate stories, perhaps with a continuous ramp. In

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

addition to the apartments of high officials, other noteworthy structures are the temple of Nabu, south of the palace, and the temple of the Sibitti. On the southwest flank is another palace, perhaps that of the crown prince, with a colonnaded portico which links one of the courtyards with the terrace. The stone reliefs, many of them now in the Louvre, that adorned the residence of Sargon II are especially remarkable (I, PL. 514; IX, PLS. 488–490; X. PL. 134).

Pub., XXXVIII, XL), 2 vols., Chicago, 1936–38; F. Safar, The Temple of Sibitti at Khorsabad, Sumer, XIII, 1957, pp. 219–21.

Tepe Gawra. Site near Mosul explored from 1931 to 1938 by an American expedition headed by E. A. Speiser. Although no written documents were found, the excavations produced considerable evidence of continuous occupancy of the site from the Neolithic age to the middle of the 2d millennium B.C. The early chalcolithic period is represented by Tell Halaf pottery found in two areas outside the tepe; in one case six levels of it were found. On Tepe Gawra itself, the oldest level, XX, dating from the middle chalcolithic period, is characterized by al-'Ubaid pottery, which predominates in the succeeding levels up to level XII. The architecture of the al-'Ubaid period is documented in levels XIX–XVIII by irregular rectangular structures and in level XVII by tholoi; some of these structures may have been temples. Stamp seals, seal impressions, and terra-cotta figurines were also found. The al-'Ubaid period II culminates in level XIII with a temple which has walls with recesses and deep niches, and which doubtless formed part of a larger sanctuary; this layer also contained pottery, stamp seals, and terra-cotta figurines. Levels XIa–X have yielded pottery of the Uruk type, stamp seals, animal figurines, and tholos structures, including a large tholos with several rooms in level XIa. Level IX, which has the same type of pottery and a temple with three aisles, is definitely contemporaneous with the period of Uruk VI–IV. Similar temples found in level VIII were evidently long in use. Level VII has yielded stamp and cylinder seals, several of which are from the Jamdat Naṣr-Mesilim transitional period, and level VI has principally yielded cylinder seals from the age of Akkad. Levels V and IV contain buildings on stone foundations; one of these characteristic structures is unmistakably a temple. The last three levels date from the 2d millennium and have furnished typical Nuzi pottery.

IRELAND. This island nation, lying to the west of Great Britain, was known to the Greeks as "Ierne" and to the Romans as "Hibernia" or "Scotia," while its own Celtic-speaking inhabitants have called it "Éire" (mod. Irish) or "Ériu" (early Irish). Although its geographical position on the edge of European civilization has favored conservatism and a certain originality, its cultural and artistic development has also been affected by links with the neighboring larger island (see GREAT BRITAIN). Numerous contacts with the neolithic peoples and the culture of Atlantic Europe existed even in the 3d and 2d millenniums B.C. In the 1st millennium B.C. the land was occupied by Celtic-speaking peoples. Since Ireland, unlike Britain, was not brought within the Roman Empire, Celtic culture persisted into medieval times. Missionaries from Gaul and Britain evangelized the island in the 5th century, bringing the knowledge and use of letters and the rudiments of Roman and Christian civilization. There followed a great flowering of monastic culture and an expansion of Irish Christianity; missionaries went to Scotland, Anglo-Saxon England, Gaul, Switzerland, Germany, Austria, and northern Italy in the 6th to 8th centuries. In the following centuries Ireland suffered much from the attacks of vikings, who came chiefly from western Norway. The Norse harbor settlements became the first cities and towns in the country. In 1169 Ireland was invaded by the Anglo-Normans in an effort to bring it under the English crown; by the end of the 16th century most of the country had been subdued after centuries of warfare, and there was a consequent diffusion of English culture and artistic principles. By this date the struggle between the Irish and English had become largely a religious one, since Ireland had remained predominantly Catholic. The struggle persisted until 1920–21, when the island was partitioned. Six counties (Northern Ireland) have remained under English rule, and the other twenty-six (Éire) have achieved independence, first within the British Commonwealth, and subsequently as an independent republic. (See also ANGLO-SAXON AND IRISH ART.)

SUMMARY. Cultural and artistic periods (col. 310): *Prehistory and protohistory. Celtic Christianity and the vikings: a. Manuscript illumination; b. Sculpture; c. Metalwork; d. Architecture. The Romanesque period. The late Middle Ages. From the Renaissance to modern times.* Art centers (col. 321).

CULTURAL AND ARTISTIC PERIODS. *Prehistory and protohistory.* The neolithic colonists of Ireland left an impressive series of megalithic tombs, of which about two thousand are still to be seen. The tombs are of three major classes, known as "court cairns," "passage graves," and "wedge-shaped galleries." The earliest group, the court cairns, includes many fine specimens. A roofed gallery of massive stones, divided into segments and entered from an open court, is characteristic of this group. The whole tomb is set in a long mound of stones — some of the mounds exceed 150 ft. in length. Court cairns are found chiefly in the northern half of Ireland; two of the finest examples are in County Sligo at Deerpark (or Magheraghanrush) and at Creevykeel.

The passage graves, grouped in cemeteries sited on hilltops, are the most important class for the history of Irish prehistoric art. They date from late Neolithic and possibly early Bronze Age times (ca. 2.000 B.C.). Of Mediterranean type, they consist of a chamber and an entrance passage constructed of great blocks of stone, the whole covered by a round mound. Irish tombs of this class, although closely related to similar tombs in the Breton peninsula, have some distinctive features, principally the frequent use of a cruciform plan in the chamber. Often the surfaces of the stones are dressed with a hammer, and in some of the cemeteries the stones are covered with a profusion of ornament; various abstract or geometric motifs (spirals, chevrons, lozenges, concentric circles, meanders, and other linear patterns) are pecked into the surface, probably with stone mauls. The general effect is often dramatic and striking, since the patterns may appear on the stone curb which retains the mound, on the orthostats of the passage and chamber, and on lintels and roof stones. With the exception of the spiral, which is characteristically Irish, the motifs are comparable to those carved on Breton passage graves and to those found on schist idols and other objects in Spanish passage graves. The larger tombs particularly achieve very impressive architectural effects, especially where the linteled passage is long and the corbel-domed roof of the chamber remains. The principal centers are Carrowmore (Co. Sligo), where there is a cemetery without ornament; Loughcrew (Co. Meath); and

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

the Boyne Valley east of Slane (Co. Meath). The huge and richly ornamented tomb at Newgrange in the Boyne group is one of the most splendid megalithic tombs in western Europe. Some fine specimens of megalithic art may be seen also at Fourknocks (Co. Dublin), an excavated tomb which is an outlying example of the Boyne group. The wedge-shaped galleries, which date from the beginning of the Bronze Age, are the latest group; they are much smaller, and their interest is chiefly archaeological.

Ireland became an important metalworking center at the beginning of the Bronze Age, exporting metal objects to Britain and northern Europe. The so-called "lunulae," exported to France and the Baltic areas at this time, are the earliest examples of objects of display in Irish gold. They are crescent-shaped objects in sheet gold intended to be worn on the neck or breast. The moon-shaped panel has incised patterns of chevrons and lozenges, usually distributed with restraint in a balanced composition of ornament. The chief collection of these and other examples in bronze and gold of the abstract and decorative arts of the early Bronze Age belongs to the Royal Irish Academy and is housed in the National Museum of Ireland (Dublin).

This same collection also includes many magnificent specimens of the goldsmith's art from later Bronze Age times. Torques and circlets made of twisted ribbons or bars of gold, and large enough to be worn around the neck, or even in some cases around the waist, range in date from early Bronze Age to early Iron Age times. So-called "sun disks" of sheet gold, with incised ornamental patterns, were made both in early and late Bronze Age times, but with different patterns. Gold earrings, pins, rings, and bracelets occur in such numbers as to show that prehistoric Ireland, like Mycenae (which, indeed, provides parallels for some of the objects), was "rich in gold." The most distinctive group of objects is that of the gold gorgets, massive collars, more or less in crescent form like the lunulae, but ornamented with repoussé moldings that are alternately plain and decorated. At the terminals are large disk-shaped plates with ornaments of concentric circles, conical bosses, and the like. All these come from a limited area in southwestern Ireland.

In Ireland a version of the La Tène style appears in the early Iron Age and persists through the Roman period. Among its earliest manifestations are carved stone monuments, presumably of ritual or religious significance; one or two survive in the west, the most perfect at Turoe (Co. Galway) and at Castlestrange (Co. Roscommon). Both are large, rounded, omphaloslike stones carved on the curved surface with flowing curvilinear designs that — on the Turoe stone at least — seem to be related to the Continental Waldalgesheim style, although the carvings cannot be precisely paralleled in stone monuments outside Ireland. There are also some barbaric human representations in stone, which seem to be of Iron Age date; these are found chiefly in the north, notably on Lustymore Island in Lough Erne (Co. Fermanagh) and in a group near Armagh.

The art of the Iron Age, however, is chiefly represented by fine metalwork. The objects of display and luxury which survive from this period, although not numerous, are of high quality; they possess special importance for the history of Irish art, since the origins of the later Christian art styles can be traced in part to them. The principal collections of Irish art of this period are those of the National Museum in Dublin, the Belfast Museum and Art Gallery, the Cork Public Museum, and the British Museum in London. There is some goldwork — notably the collar from Broighter (Co. Derry) — but bronze is the predominant medium of this age. The objects include engraved scabbards, cups and bowls, trumpets, fibulas, horse trappings, and a series of large bronze disks or dishes of unknown purpose with repoussé ornament. Included in one small group of these bronzes are two sets of horns (perhaps from horned helmets) and a convex bronze disk, all masterpieces of bronze-working technique. These have a fine relief ornament composed of elegant and balanced patterns of spirals, with trumpet-shaped and ornithomorphic terminals, produced by graving and channeling the surface of the bronze. The "trumpet pattern," which also appears in cast and repoussé work, is one of the basic motifs of the art of early historic times.

Celtic Christianity and the vikings. Ireland made its most original contributions to art during the period from the coming of the first Christian mission until the height of the viking wars (5th–10th cent.); particular distinction was achieved in the fields of manuscript illumination, stone carving, and metalwork. Owing to the establishment of an Irish kingdom in western Scotland, to the expansion of Irish Christianity from the 6th century onward, and to the carrying-off by the vikings of much booty from Ireland to their homeland, some of the centers important for the study of Early Christian Irish art are outside Ireland.

a. Manuscript illumination. The use of writing in Ireland became established in the 5th century simultaneously with Christianity. The barbarian invasions of the Roman Empire at the same period caused the young Irish Church, for a time, to develop more or less in isolation; its monastic culture blended Roman and Celtic traditions with those Germanic traditions which were acquired to some extent through contacts with Britain and the Continent. Irish monks, copying sacred texts, developed a distinctive and beautiful script in the Celtic half-uncial, the earliest example of which may be seen in the Cathach of St. Columba (I, PL. 284), a fragmentary manuscript of the Psalms. This manuscript, dating from the end of the 6th century, is in the library of the Royal Irish Academy in Dublin. Here can be seen the very beginnings of Irish manuscript ornament, characterized by the initial letters, which are enlarged and embellished with simple designs in vermilion, and by the subsequent letters, which diminish in size as they lead from the initial into the main text. From the surviving manuscripts, this tendency can be traced through the 7th and 8th centuries until an initial (especially the Chi-Rho monogram of Christ) may fill a whole page (I, FIG. 452; PL. 281). It was also in the 7th century that the custom began of devoting a whole page to ornament ("carpet pages"), to an illustration, or to the representation of the symbol of an Evangelist (I, PLS. 282, 283).

The most important center for the study of Irish illumination is the library of Trinity College, Dublin; other important centers are the Cathedral Library at Durham in northern England, the British Museum, the Stiftsbibliothek at Saint-Gallen in Switzerland, and the Biblioteca Ambrosiana in Milan. Single manuscripts can be seen in many other libraries.

Durham Cathedral Library houses a fragment, only a few pages (Ms. A.II.10), of the earliest-known fully illuminated Gospel book of this group (I, PL. 284). Its date is early in the 7th century, and its chief interest is the first appearance of a motif that was to become a standard feature of Irish ornament, ribbon interlace — in this case a plait of broad bands with its contours picked out in a contrasting color. Another fragmentary Gospel book of the early 8th century (Ms. A.II.17) shows the developed repertory of Irish (or Hiberno-Saxon) ornament. It contains a somewhat faded page devoted to a representation of the Crucifixion, as well as some enlarged initials with skillfully designed ornament of trumpet patterns and animal interlace. The British Museum contains the Lindisfarne Gospels (Cotton Nero D.IV; I, PLS. 280, 282), a sumptuously ornamented manuscript written toward the close of the 7th century by an Anglo-Saxon in the Irish foundation of Lindisfarne. The library at Saint-Gallen, another Irish foundation, also contains fragments of a number of manuscripts (I, PL. 282) written and illuminated in the Irish style. Some of the surviving manuscripts from the Irish monastery of Bobbio, which were housed in the Biblioteca Ambrosiana in Milan, suffered damage or destruction in a fire at the beginning of the 20th century, but material of interest still remains (I, PL. 283).

Among the treasures of Trinity College Library is the Book of Durrow [Ms. 57 (A.IV.5); I, PLS. 283, 284; I, FIGS. 449, 451]; named from the monastery in County Offaly where it originated, it is a Gospel book written shortly after the middle of the 7th century. It is the earliest work to show the full repertory of motifs in the Irish "vernacular style" of the early Christian centuries. Its carpet pages are of particular interest: Celtic motifs (spirals and trumpet patterns), Anglo-Saxon motifs (ribbon animals), and Mediterranean motifs (ribbon interlacing) are present in various combinations, which are not blended together but are kept in separate panels. A page is devoted to the symbol of each Evangelist, and on these, as on the abstract ornament, the influence of metalworking designs is perceptible; one of the carpet pages in particular is like a full revival of the richness and elegance of the best La Tène art. The great treasure of Trinity Library, however, is the Book of Kells [Ms. 58 (A.I.6)], named from the monastery in County Meath. This Gospel book of the beginning of the 9th century is a large manuscript, profusely ornamented on every page. Painted with hard, clear colors glowing with the richness of enamels, it is an incomparable and mysterious work. Its art is so deeply devoted to perfection in miniature that, although the general appearance is most impressive, the microscopic fullness of detail seems designed, not to please the eye of the beholder, incapable of comprehending it, but rather to please the mind of the artist, or God. There are elaborate carpet pages, pages devoted to the symbols of the Four Evangelists, full-page illustrations of the text (I, PL. 283), enlarged and elaborated initials, and many interlinear drawings and ornaments. The Chi-Rho monogram (I, PL. 281), which receives a page to itself, is a fantastic compendium of abstract motifs of early Irish art: spirals and trumpet patterns whirling within spirals and trumpet patterns; minute interlacings and frets; faces, animals, and figures of angels tucked into corners of the design. The Book of Kells is one of the most remarkable monuments of western Christian art. Other less elaborate manuscripts, including the Book of Dimma and the Book of Armagh, are also housed in Trinity Library.

b. Sculpture. The chief surviving monuments of early Irish monasticism are not the churches (small structures usually of wood-

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

which have long since vanished) but the carved stone crosses. This peculiarly Insular development is also found in Britain. The distinctive Irish form is a ringed cross, its arms projecting beyond the open ring and its shaft standing on a pyramidal or subconical base. The surfaces of both cross and base were usually carved with ornament or representations in relief.

The earliest group of Irish high crosses, which dates from the late 7th century, is on the Inishowen peninsula (Co. Donegal). The most important monuments of the group are at Carndonagh, where there is a slablike cross (without a ring) carved with interlace and other patterns, as well as with some human figures, in a style close to that of the Book of Durrow.

At several small monastic sites in the southern midlands there are more monumental crosses of an important 8th-century group. The best centers are Ahenny (Co. Tipperary) and Kilkieran (Co. Kilkenny), places which are only two miles apart. The crosses here are of architectural scale and proportions. The characteristic form has a large open ring set in a rather low position on a shaft that tapers gradually toward the top. Some of the massive bases have carvings of figured scenes depicting hunting parties, animals and birds, a funeral, or ecclesiastics holding pastoral staves. In the Ahenny-Kilkieran group the head, shaft, and ring are characteristically carved in a bold and extremely effective relief; patterns which are derived directly from metalwork are employed, and despite their drastic change of scale, they remain surprisingly successful in translation. There are bold ornamented bosses as well as panels of trumpet spirals, interlace, and fret patterns. Since the monuments are carved in a hard sandstone, the relief is still bold and clear in spite of centuries of exposure. A somewhat later group, of the 9th century, which is located in the valley of the River Barrow, shows the development in figure carving. Castledermot and Moone, which are a few miles apart in County Kildare, are the chief centers. The Barrow Valley crosses, which are carved in a somewhat coarse-grained granite (an intractable medium for the purpose), possess a distinctive style of their own. The ringed head is a characteristic feature of this group. On its broader faces the shaft of the cross normally has series of panels of figure sculpture which depict Biblical scenes. The commonest subjects in the group are Daniel in the Lions' Den, the Sacrifice of Abraham, the Three Children in the Fiery Furnace, the Miracle of the Loaves and Fishes, and the Crucifixion. Panels depicting the Twelve Apostles also recur. The taller of the two crosses at Moone is the most impressive of the group; it possesses an unusually tall, tapering base on which the figure carving is (atypically) concentrated. The simplification and stylization of the figures, which are carved in a low relief on two planes, produce a curious effect. The panel of the Twelve Apostles in particular is remarkable: the heads are simple ovoids with circular eyes, and the bodies are perfect squares below which out-turned feet protrude; the whole panel produces an appearance of abstract geometry rather than of human life. The shaft of this cross is occupied by panels depicting animals (largely fabulous) from the bestiaries, together with some panels of ornament.

Many of the 8th- and 9th-century crosses seem to be experiments directed toward a successful blending of the various elements of the design. The satisfactory solution, achieved about the beginning of the 10th century, is represented by examples at a number of monastic sites in the midlands; those of particular importance are at Kells (Co. Meath), Clonmacnoise (Co. Offaly), and Monasterboice (Co. Louth). At Kells there are remains of five crosses: the Cross of Patrick and Columba (named from a Latin inscription on its base), from the beginning of the 9th century, has a shaft that is still largely devoted to ornament but bears the beginnings of figure carving; the west cross, a fragment consisting of about half the shaft, is of the fully developed, early 10th-century type; the base of another cross, probably of the 9th century; the east cross, probably of the late 10th century, on which the sculptor's preliminary methods may be studied, because the carving is unfinished; and the market cross, which is typical of the midlands, early 10th-century group. Clonmacnoise is probably the most important center of early Irish stone carving; in addition to the crosses, there are a number of grave slabs. The south cross here, a handsome monument, is of the 9th-century transitional type, which is characterized by some figure carving on the shaft. The west cross, or Cross of the Scriptures (early 10th cent.), has the fully developed scheme, displaying a ringed head with the Crucifixion depicted on its west side and the Last Judgment on its east side; the shaft below is divided into rectangular panels with figured scenes and the base is carved with friezes showing mounted warriors, chariots, birds, and animals. There are also parts of the shafts of other 9th-century crosses and of a 12th-century cross. Minor but very accomplished manifestations of the stonecarver's art are about five hundred inscribed gravestones of the Early Christian period at Clonmacnoise. Some are whole and some fragmentary. Most of the inscriptions are in Irish, with a few in Latin, and the script is in the style of the manuscripts. Many of the slabs also display ornamental or cruciform patterns in a graphic low relief which, again, is most closely paralleled in the manuscripts. In the west midlands — at Gallen (Co. Offaly), Durrow (Co. Offaly), and on Inishcaltra, an island in Lough Derg (Co. Clare) — there are other important groups of these early grave slabs. The slabs are often elegant and distinguished works of design. Monasterboice (Co. Louth) has the two finest high crosses, which date from that period during the 10th century when the form reached its peak of development. The more perfect of the two is the Cross of Muiredach, named for the abbot who had it carved. This monumentally tall sculptured cross dominates the graveyard. The sandstone head, shaft, and base are carved in high relief in a strict scheme of iconography and ornament. On the east face of the head is the most elaborate depiction of the Last Judgment in the whole series. Christ appears in the Osiris attitude of majesty, with crossed scepter and cross. On His right are the saved, led by a group playing musical instruments, and on His left are the damned, being driven away by a demon bearing a trident. Below is shown the weighing of souls. On the west face of the head is depicted the Crucifixion: Christ on the Cross, with two angels supporting His head, and the lance- and sponge-bearers. Each of the main faces of the shaft below these carvings is divided into three panels with figured scenes, including the fall of man and the murder of Abel. The weathered carvings of the base are the usual hunting scenes and the like. The west cross at Monasterboice, nearly 20 ft. high, has similar panels, more numerous but more severely weathered. There is a third cross carved with only a Crucifixion and a roundel of spirals on the two faces of the head.

Later crosses, which usually occur singly at various sites in the northern parts of Ireland, show a slow decline until a new and typically Romanesque form of cross appeared in the 12th century.

c. Metalwork. The great center for the study of Early Christian Irish metalworking is the National Museum of Ireland, which houses the rich collection of the Royal Irish Academy as well as other specimens. There are also important collections in the British Museum and in the National Museum of Antiquities of Scotland in Edinburgh. Many examples of the precious metalwork carried off by the vikings have been recovered from their graves in western Norway and may be seen in the museums of Oslo, Stavanger, Trondheim, and Copenhagen. The series begins with secular objects dating approximately from the introduction of Christianity into Ireland. Pins, brooches, and dress fasteners at first show Roman influences in their form but rapidly become assimilated to Irish taste and techniques. The commonest early form of brooch was penannular, its expanded terminals ornamented in enamel or millefiori glass. Various simpler forms of pins were also produced, often with cast bronze heads showing patterns in reserve bronze and red champlevé enamel. From about the beginning of the 7th century small reliquaries were being made for the monastic churches. These small caskets, usually of yew sheathed with tinned or silvered bronze, are ornamented with punched or engraved work and with medallions of enamels or of interlaced patterns in gilt relief casting. There are a few of these simple but beautiful objects in the National Museum in Dublin; but as a result of the depredations of the Scandinavian raiders, many of the most interesting examples or fragments are to be seen in the viking grave material in Norway. There are also two fine examples in Edinburgh. Toward the end of the 7th century great elaboration and skill characterized the Irish metalworking, partly as a result of new techniques such as polychrome enameling, gold filigree working, low-relief casting in imitation of chip-carving technique, and the manufacture of elaborate glass studs with silver inlays. The three chief triumphs of this phase of style may be seen in the National Museum. These are the Tara Brooch (from Bettystown, Co. Meath; I, PL. 289), the Ardagh Chalice (I, PL. 285), and the Moylough belt-shrine (IV, PL. 407). These marvels of metalworking art and skill, particularly the brooch and chalice, in the perfection of their fine work rival the minute intricacies of the manuscript painters. The chalice, a heavy two-handled vessel of silver alloyed with bronze, is a major work of art, restrained in the disposition of its ornament but extraordinarily rich in detail in its ornamental panels and mountings, both in the number and elaboration of the techniques employed and in the masterly handling of the motifs (interlacings, animal patterns, frets, and spiral patterns).

This period (ca. A.D. 700) marks a peak in the development of Irish metalworking. A further peak appears in the early 12th century with a different style, though one employing basically the same kinds of motifs. A more or less continuous stream of objects spans the centuries between, including several groups of large elaborate brooches, a large group of crosier, or staff, shrines, and a large group of book shrines. The most splendid among the 12th-century works is the processional Cross of Cong, a great bronze reliquary made to house a relic of the True Cross. This is in cast bronze with openwork panels of animal interlace, settings of glass and enamel, and panels of filigree; a great, ornamented animal's head, cast in the round,

grips the foot of the shaft. This and most of the other major works may be seen in the National Museum in Dublin.

d. Architecture. Early Irish buildings, including the earliest churches, were of wood, and none has survived. Stone buildings seem gradually to have become more common in the 10th–12th centuries. Because of the cenobitic nature of Irish monasticism, the churches were small and simple; when serving a large community, they were multiplied in number rather than increased in size. For centuries ornament was concentrated on the high crosses rather than on the churches. The chief interest of these little buildings is that, unlike most early churches elsewhere, they were not at first influenced by Roman traditions of building. A fine example of the simplest type of stone oratory, corbel-built virtually without mortar and rather similar in shape to an upturned boat, still stands at Gallarus (Co. Kerry). The most remarkable site is an intact Irish monastery, probably of the 7th century, which stands high on Skellig Michael (Scelig Mhichil), a rock in the Atlantic Ocean 10 miles from Cahirciveen (Co. Kerry). Six small, beehive-shaped huts (the cells of the monks) share a long narrow enclosure with two oratories, some roughly shaped crosses, and a small graveyard with simple slabs. A similar site, also in the Atlantic but less perfectly preserved, is on the island of Inishmurray in Sligo Bay. The succeeding type of mortar-built church was generally a simple, small, wooden-roofed structure. Single-celled and built of massive masonry, they have projections (antae) of the side walls at the gable ends and a trabeated west doorway, the jambs of which are inclined inward toward the top. Sometimes a cross is carved or incised on the lintel, or a simple architrave may frame the doorway. More rarely the church has a steep stone roof built on the corbel principle; often the roof is supported by a propping arch inside, which also provides a croft, or roof chamber. An example of this type of roof may be seen at Kells in a building which probably dates from the beginning of the 9th century. The best center for examples of early stone churches, however, is Glendalough (Co. Wicklow), where, among others there are ruins of one of the principal early monasteries. St. Kevin's Church here is a very fine example of the stone-roofed type. At Killaloe (Co. Clare) may be seen two stone-roofed churches as well as other monastic stonework.

The first works of a truly architectural character in the monasteries — and a most distinctive feature of the Irish landscape — are the round towers, which served as bell towers and places of refuge for the monks. These tall, slender, tapering buildings have conical stone roofs, doorways high above the ground, and a single window for each floor, with four, six, or eight windows at the top, or bell loft. The floors were of wood, approached by ladders, and the bell rung from the top was a small hand bell. These elegant buildings range in date from the late 9th to the late 12th century; they probably owe their original inspiration to Italian belfries. Fine examples may be seen at Clonmacnoise, Glendalough, Cashel (Co. Tipperary), Ardmore (Co. Waterford), and Kilmacduagh (Co. Galway).

The Romanesque period. Elaborate ornament was first applied to Irish churches in the early 12th century, but while the early Irish monastic system persisted, the churches themselves remained structurally simple and small. On the Rock of Cashel, an ancient royal seat in County Tipperary, Cormac MacCarthy (Mac Carthaigh), King of Munster, built a church (1127–34) which is known as "Cormac's Chapel." A conscious effort to introduce the Romanesque style to Ireland, this church remains one of the most interesting in the country. The building, which consists of a rectangular nave and a small square chancel with square towers at the junction of the two, is quite small but elaborately constructed and ornamented. There is a great north porch, gabled and carved with chevrons, animal heads, and other features; both the inner and the outer doorways of the porch are recessed in orders. There is also a south doorway with carved ornament and a third ornamented doorway leading from the interior of the church into the north tower. The chancel arch is elaborately carved in four orders and has a ring of human masks around its outer arch. Blind arcading ornaments both the interior and exterior of the walls, and there is a corbel table of grotesque animal heads. The church has stone roofs with crofts over both nave and chancel; over the nave the roof is supported on a barrel vault, over the chancel on a rib vault. Traces of frescoes remain on the walls and vault of the chancel. Cashel has two other 12th-century monuments: a sarcophagus and a high cross of the distinctive late type without a ring; carved on one side of the cross is a large figure of Christ crucified, and on the other side is a large figure of a bishop. The sarcophagus, with a relief carving of animal ornament in the late Irish version of the Scandinavian Urnes animal style, is very similar in detail and probably near in date to the Cross of Cong.

At Cashel the imported Romanesque style was assimilated into the Irish sculptural tradition, losing its architectural character to become simply a medium of decoration on the doorways, chancel arches, and windows of churches, which remained small in scale and simple in design and structure. The Norman Romanesque chevron, eagerly adapted and elaborated, combines with animal interlace and other native motifs and with human and animal heads in a blended Hiberno-Romanesque ornament. Bases recede to no more than the thickness of the column above. Capitals are reduced to square blocks carved in low relief, which could be treated as a running frieze from order to order. Architectural features are generally suppressed in favor of surface ornament. Remarkably vivid and graphic effects could sometimes be produced by this fine web of ornament in sandstone. There is extremely interesting Irish Romanesque work at Clonmacnoise, the site of several ornamented churches, notably the Nun's Church, which is some distance from the main monastery.

Other centers of interest for the study of Irish Romanesque architecture are Glendalough (Co. Wicklow), Killaloe (Co. Clare), Ardfert (Co. Kerry), Rahan (Co. Offaly), and Kilmore (Co. Cavan). The late Romanesque church at Tuam (Co. Galway) displays extreme elaboration of ornament on its chancel arch and three-light east window, the latter a feature unique in Irish Romanesque. In the same town there are also remains of two mid-12th-century high crosses, elaborately carved in relief with animal ornament. A further conjunction of late cross and Romanesque doorway (ca. 1150) may be seen at Dysert O Dea (Co. Clare). Not far away in the same county is a remarkable group of 11th- and 12th-century high crosses with rich animal ornament and carvings of the Crucifixion and of bishops and abbots. Probably the most characteristically Irish Romanesque works are the doorways at Killeshin (Co. Leix) and Clonfert (Co. Galway), which are crowned with steep-sided pediments and treated with great elaboration of surface ornament. At Killeshin the fine, linear ornament is carved in the lowest relief; at Clonfert, where the doorway recedes in seven orders, the profusion of carving in bold relief gives an effect at once barbaric and splendid and masterly.

The late Middle Ages. The Anglo-Norman invasion makes a sharp break in the tradition of Irish art, although it was not the sole cause of the break. The monastic system was already disintegrating as the result of reform movements within the Church, and ancient Celtic traditions were being overshadowed by Continental fashions. For the next few centuries only architecture and sculpture left remains (mostly ruins) worthy of study, and these no longer have so distinctively Irish a flavor.

The buildings of the Cistercians, the first of the Continental religious orders to be firmly established in Ireland, are of some interest. The most important was their first foundation, Mellifont (Co. Louth), founded by representatives from Clairvaux in 1142 and completed in 1157. This abbey was destroyed by fire in the 13th century, rebuilt, almost totally destroyed again after the Reformation, and later almost completely buried by a landslide. The site was excavated for the Office of Public Works in 1945–55, and the foundations of two successive abbeys can now be studied. The remains show a typical Cistercian plan, with some Irish features in those carvings which remain. Extremely beautiful carving in the Irish Transitional style remains in the elegant arcaded octagonal lavabo which was added to the cloister garth about 1200. Part of the simple but beautiful cloister arcade, the arches of which spring from paired columns, was found in collapse and has been reerected in position. The other principal Cistercian sites — Baltinglass (Co. Wicklow), Boyle (Co. Roscommon), Kilcooly and Holycross (Co. Tipperary), and Jerpoint Abbey (Co. Kilkenny) — are all impressive ruins, with the carving in particular showing a blend of Irish with French or English traditions. Most have 15th-century cloister arcades of an Irish type with twin columns connected by a web of stone; most also have at the crossing a distinctively Cistercian squat square tower, added in the 15th century when the abbeys were fortified. At Boyle, as at such fine non-Cistercian houses in the west as that of the Canons Regular (Augustinian Canons) at Cong (Co. Mayo), are fine specimens of Irish Transitional work of the early 13th century, characterized by delicate foliage carving, sometimes with human or animal figures, and showing western French influence. At Kilcooly and Holycross there are numerous examples of 15th- and 16th-century sculpture, chiefly altars or altar tombs, which are treated with Gothic arcades occupied by figures of the Twelve Apostles and other saints, rather squat in proportion but lively in delineation. A fine collection of similar carvings may be seen in the 13th-century cathedral on the Rock of Cashel.

In the 13th century the Anglo-Normans built cathedral churches in the Early English style; however, in comparison with English work, these were small in scale. The most notable examples are at Cashel, Kilkenny, Kildare, and Ferns. Stone, and perhaps complete carvings, were imported from Britain for some of these. Perhaps more interesting is the somewhat later work in the east and southeast (the areas most intensely settled by the invaders), which has a more

local character; the parish churches of New Ross (Co. Wexford) and Gowran and Callan (Co. Kilkenny), where there is much Hiberno-Norman work of the 13th–15th centuries, are noteworthy, as is the fine series of life-size figure sculpture (ca. 1300) in the graveyard of the modern Church of Ireland Cathedral at Cashel. It is in military architecture, however, that the invaders first left their mark on the Irish countryside, again in a simple extension to Ireland of an English or Welsh style, though a local type of castle, characterized by a great

square keep with round corner turrets (exemplified by the ruined castle of Carlow) was developed by the late 13th century.

In general the chief centers for Hiberno-Norman architecture and sculpture are Trim (Co. Meath), with ruins of a great and magnificent castle (ca. 1200), a cathedral priory church, walls, gates, abbey ruins, and medieval effigy tombs; Kilkenny, with a cathedral, castle, and ruined abbeys and friaries; Cashel, where the rock rising dramatically from the north Munster plain is crowned with ruins, below which lie the remains of Benedictine and Dominican abbeys; and the great fortified houses of the Canons Regular at Athassel (Co. Tipperary) and Kells (Co. Kilkenny).

In those parts of the country which retained native Irish traditions, the most interesting works of architecture are the Franciscan friaries and the late medieval, lightly fortified tower houses. The friaries are small and intimate in scale, the two-storied domestic buildings compactly grouped around a small cloister and against a narrow church, from which there characteristically rises a slender tapering square bell tower. This grouping makes a charming composition, whether seen from a distance or from the arches of the small cloister. An extremely well-preserved example may be seen at Quin (Co. Clare), and there are other excellent examples at Adare (Co. Limerick), Moyne and Ross Errilly (Co. Galway), Kilconnell (Co. Galway), and Ennis (Co. Clare). The tower house of the 15th and 16th centuries was usually a square stone tower with stepped battlements, mural staircases, one or two floors on stone vaults and the others of wood, and a small walled bawn attached. The tower houses are very numerous, and good examples survive at Dungory, near Kinvarra (Co. Galway), and at Castledoe (Co. Donegal). At Bunratty, near Shannon Airport (Co. Clare), a late tower house has been fully restored, furnished in period, and fitted out as a museum.

From the Renaissance to modern times. The Renaissance, which came late to Ireland, first appears in the form of interior ornament, fireplaces, and other minor features in the English Tudor styles. Little of this survives, for the 16th and 17th centuries were periods of merciless warfare. Only one Elizabethan manor house, Ormonde Castle at Carrick-on-Suir (Co. Tipperary), survives in any worthy state of preservation. It is a long two-storied stone building with a hall just 100 ft. in length, which still contains extensive remains of 16th-century stuccowork (portrait medallions, armorial bearings, and allegorical figures) as well as carved fireplaces. Early-17th-century houses are more numerous but are mostly undistinguished or in ruins.

The full effects of the Renaissance were not felt until the late 17th century, when James, Duke of Ormonde, began to replan Dublin as a worthy capital city. This was a period of noble domestic and public architecture, even though painting and sculpture achieved no great distinction. Such minor arts as stuccoworking, bookbinding, and glass cutting flourished, particularly during the second half of the 18th century.

The chief center for the arts of this period is undoubtedly Dublin, scene of the work of the architects Edward L. Pearce (Bank of Ireland), Sir William Robinson (Kilmainham Hospital), Thomas Burgh (Trinity College Library), and, particularly, Richard Cassels (Tyrone House, Clanwilliam House, Powerscourt House, and Leinster House, now the meeting place for Dáil Éireann, the Irish Parliament).

Outside Dublin, similar work was done on a smaller scale in the principal towns. Many of the smaller towns have excellent courthouses or market-houses dating from the 18th or early 19th century; the courthouse at Carlow and the market-house in the village of Dunlavin (Co. Wicklow) are good examples. Great country houses were also built; some of the finest — such as Carton and Castletown (Co. Kildare) and Russborough (Co. Wicklow) — are by Cassels.

The later 19th century was a period of decline in Irish architecture. Two noteworthy buildings in Dublin, however, are the museum building of Trinity College (1853–57) and the Kildare Street Club (shortly after 1860), both by Sir Thomas Deane and Benjamin Woodward. On the whole, later work is undistinguished, and Ireland has little to show in the way of original modern architecture (although the terminal building at Dublin Airport and the Dublin bus terminal building by Michael Scott are worthy designs).

Shortly before and after 1800 James Malton, who made excellent etchings of Dublin, and George Petrie were distinguished engravers in the minor field of topographical illustration. Until recent times painting and sculpture, however, have played very minor roles in Irish art. Irish painting has tended to have a rather literary character, which can be traced through the works of Sir William Orpen, Horace Hone, Daniel O'Neill, John Butler Yeats, and Jack Butler Yeats. Since World War II, original work of a different character has been produced by a growing number of painters and sculptors, among whom should be mentioned Pat Scott, Hilary Heron, Oisin Kelly, and Ian Stuart.

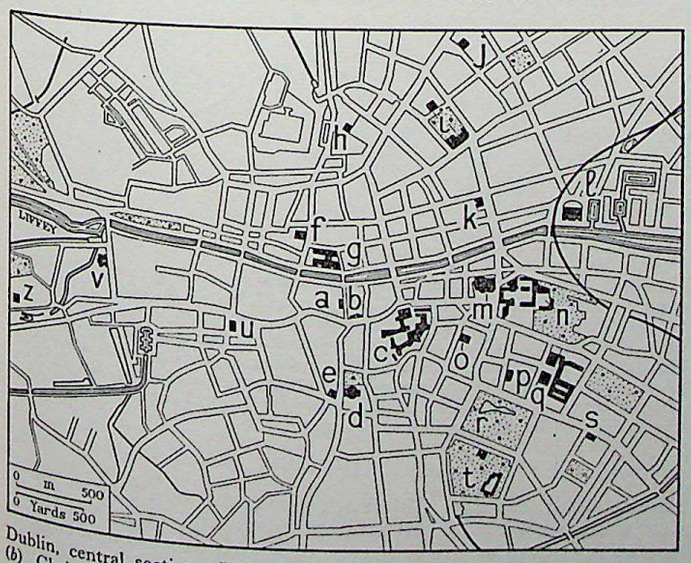
ART CENTERS. Dublin (Baile Átha Cliath). Founded by the Norse in the 9th century, Dublin gradually became the center of English rule in Ireland after the Anglo-Norman invasion in 1169. When Ireland had an independent Parliament for a few years at the close of the 18th century, its seat was in Dublin. Few traces of the small medieval city remain; it was swept away in the replanning of Dublin as a worthy capital, which began at the end of the 17th century and continued into the early 19th. After the Act of Union (1800), which ended the existence of the Irish Parliament, Dublin suffered a slow decline from which it has revived only at the end of the 19th century and during the 20th. Its central areas still owe their character to the great period of building in the 18th century and, perhaps, especially to the activities of an enlightened body known as the Wide Street Commissioners, established in 1757, who controlled the planning of streets, parks, and squares.

Among the churches, the oldest foundation is Christ Church Cathedral, a monastic cathedral originally founded by the Norse and built anew by the Anglo-Normans in 1172. It was extensively rebuilt in the 19th century, but parts of the 12th-century work, purely English in style, have survived. St. Patrick's Cathedral, a secular cathedral built outside the walls (ca. 1225), was also extensively rebuilt in the 19th century. The ruined chancel of St. Audoen's, a Norman parish church, dates to about 1455. The parish church of St. Michan's includes a surviving medieval tower and crypt. St. Catherine's (1760–69) on Thomas Street, by John Smyth, has a ponderous classical design. St. George's (1802–13), influenced by St. Martin-in-the-Fields, London, is the work of Francis Johnston, also the architect of the Chapel Royal in Dublin Castle. Other churches of interest include St. Stephen's (1824–25) by John Bowden; St. Audoen's (1841–46) by Patrick Byrne, a Roman Catholic church in classic revival style; SS. Augustine and John the Baptist (1860) by Edward Welby Pugin and G. C. Ashlin, in French Gothic; and Catholic University Church (1855–56) by John H. Pollen, a miniature Byzantine basilica.

Public buildings of importance include the Kilmainham Hospital (1680–86) by Sir William Robinson, a handsome classical building around a courtyard, influenced by the Invalides (Paris), and Marsh's Library (1703) by the same architect. Steevens' Hospital and Trinity College Library (1712–32) are the work of Thomas Burgh; the roof of the latter was raised and a barrel vault added by Benjamin Woodward (1857). The Parliament House (1729; now Bank of Ireland) is mainly the work of Edward L. Pearce, with a portico by James Gandon and other additions by Francis Johnston. The main front of Trinity College (1752–60), a magnificent if severe façade on a grand scale, is the work of Henry Keene and John Sanderson. The Rotunda Maternity Hospital (1750) by Cassels, the Royal Exchange (1769–79; now the City Hall) by Thomas Cooley, and the Blue-Coat School (1773–83) by Thomas Ivory are other 18th-century examples. The work of Gandon includes the Custom House (1781–91), on the quay of the River Liffey, the Four Courts (1786–96), and the King's Inns (1795–1817). The General Post Office (1815) by Johnston; the Nelson Pillar (1808), a great Doric column surmounted by a statue, by William Wilkins; and the museum building at Trinity College (1853–57) by Deane and Woodward are also noteworthy. Collinstown Airport (1937–41) by Desmond Fitzgerald and Busaras (1949–52; the central bus station) by Michael Scott also deserve mention.



Dublin, central section. Principal monuments: (*a*) St. Audoen's Church; (*b*) Christ Church Cathedral; (*c*) Castle; (*d*) St. Patrick's Cathedral; (*e*) Marsh's Library; (*f*) St. Michan's Church; (*g*) Four Courts; (*h*) King's Inns; (*i*) Rotunda and Municipal Gallery (Charlemont House); (*j*) St. George's Church; (*k*) General Post Office; (*l*) Custom House; (*m*) Parliament House (now Bank of Ireland); (*n*) Trinity College; (*o*) Powerscourt House; (*p*) Mansion House; (*q*) Leinster House, National Museum of Ireland, National Gallery of Ireland, and National Library of Ireland; (*r*) St. Stephen's Green; (*s*) Ely House; (*t*) University College; (*u*) St. Catherine's Church; (*v*) Steevens' Hospital; (*z*) Kilmainham Hospital.

Some domestic buildings of interest are Clanwilliam House (1739), with its magnificent stuccowork on the interiors, and Leinster House (1745–48), now occupied by the National Parliament, both by Cassels. Powerscourt House (18th cent.) and two houses by Sir William Chambers — Charlemont House (1762) and the Casino at Marino (1765–71) — are significant works.

Among the museums, the National Gallery of Ireland possesses Italian primitives and representative collections of the Spanish, Dutch, and English schools of painting, while the Municipal Gallery of Modern Art contains a collection intended to represent modern art. The Irish Antiquities division of the National Museum of Ireland houses many masterpieces of prehistoric and Early Christian metalwork, while many fine examples of Irish craftsmanship in furniture, silver, and other media of more recent times are collected in the Art and Industrial division. Some of the greatest Irish illuminated manuscripts, including the Book of Kells and the Book of Durrow, are preserved in Trinity College Library. The Chester Beatty Library contains a superb collection of Oriental manuscripts.

Cashel (Caiseal). The Celtic kings of Munster had their fortified royal seat at this site, on a rock which rises from the plains of County Tipperary. The Rock was granted to the Church in 1101, and a market town developed around it in medieval times. Cashel is a good center for the study of Irish medieval architecture and carving.

The earliest building on the Rock is the Round Tower, an 11th-century bell tower, which is a perfectly preserved example of this distinctively Irish type of structure. Cormac's Chapel (1127–34), built by Cormac MacCarthy (Mac Carthaigh), is a stone-roofed two-storied Romanesque church (one story is within the roof) with a barrel-vaulted nave and a rib-vaulted chancel. There are two square towers, three carved doorways, and a richly ornamented chancel arch; traces of mural painting remain. This remarkable building is unique in Ireland. There are also ruins of a cruciform cathedral church (ca. 1250) in Early English style, with repair and reconstruction work, including the main doorway, of the early 15th century; a castle was inserted in the nave in the early 16th century. In the Cathedral are many specimens of medieval Irish carving on altars and tombs. The Dominican Friary was founded in 1243 by Archbishop David MacKelly in the town below the Rock. Hore Abbey, a late 13th-century Cistercian structure, was founded by Archbishop David MacCarroll on the plain below the Rock. In the grounds of the 18th-century Church of Ireland Cathedral there are fine medieval tomb effigies. The Deanery, in the town, is a very handsome early-18th-century house.

BIBLIOG. H. G. Leask, St. Patrick's Rock, Cashel, Co. Tipperary (Official Guide to the National Monuments), Dublin, 1935; H. G. Leask, Irish Churches and Monastic Buildings, 3 vols., Dundalk, 1955–60, passim.

Clonmacnoise (Cluain Mac Nois). One of the greatest of the early Irish monasteries, founded in the early 6th century by St. Ciarán, stood here on the bank of the Shannon in County Offaly. There are extensive ruins and other remains. A fine Irish round tower,

UP State Museum, Lucknow

"O'Rourke's Tower," was completed in 1123. Temple Finghin is a ruined Romanesque building (ca. 1160) with a carved chancel arch and a round tower attached to the chancel. The Cathedral, in ruins, was built in the 10th century and reconstructed in the late 12th and 15th centuries; it has an elaborately carved 15th-century north doorway. The Nuns' Church, now in ruins, lies some distance from the main group of buildings. Its carved doorway and chancel arch are perfect specimens of the developed Irish Romanesque style (ca. 1170). The Cross of the Scriptures (early 10th cent.), carved with scenes from the Scriptures and with panels of ornament, is one of the best surviving examples of the Irish high cross, that remarkable type of sculptural monument characteristic of the early Celtic Church. There are several other carved churches and crosses. The most important monument at Clonmacnoise is the magnificent collection of about 500 fragments or complete specimens of inscribed and often ornamented grave slabs of the 7th–11th century. Most of the inscriptions are in Irish in Celtic half-uncial lettering; the ornament, usually lightly incised, is often elegantly designed and composed.

S. Macalister, Corpus Inscriptionum Insularum Celticarum, II, Dublin, 1949; H. G. Leask, Irish Churches and Monastic Buildings, I, Dundalk, 1955.

Cork (Corcaigh). The third largest city in Ireland and the second city in the Republic, Cork was founded by the Norse in the 9th century and later developed as a port and trading center. The small Cork Public Museum has some antiquities of interest, and there is a collection of paintings in the Crawford Municipal School of Art.

Limerick (Luimneach). The third city of the Republic, Limerick was founded by the Norse in the 9th century and later developed as a port. It was also a strategic center which endured several sieges. King John's Castle (early 13th cent.) is the remains of a fine specimen of military architecture. St. Mary's Cathedral, which was founded in 1194 but has seen much rebuilding, contains remains of interesting late Irish Romanesque work, as well as some fine 15th-century carved misericords in black oak. A small museum and art gallery is attached to the Library.

Monasterboice (Mainistir Bhuithe). This site of an early monastery in County Louth contains the remains of two ruined churches, a round tower, a monastic sundial, and three carved crosses. The Cross of Muiredach here is the finest surviving example of the Irish high cross. Dating from the early 10th century, it is carved in sandstone, with elaborate compositions of figures depicting the Crucifixion and the Last Judgment on the head of the cross, other scriptural scenes on the main faces of the shaft, panels of intricate ornament, and scenes showing animals and human beings on the base. The west cross, which is taller but less perfectly preserved, is very similar to the Cross of Muiredach in its general composition. The simpler east cross has carvings of the Crucifixion, without attendant figures, and a roundel filled with spiral ornament appearing only on the head.

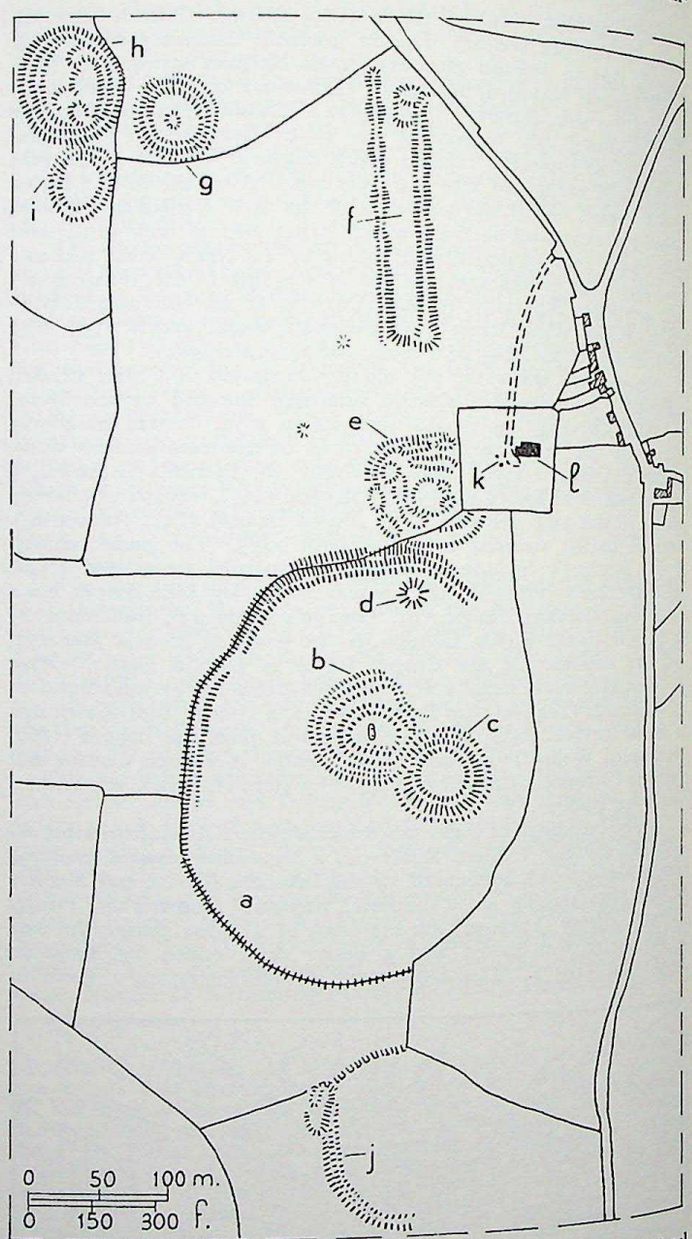
Newgrange. The principal tumulus of the great passage-grave cemetery of the valley of the River Boyne (Co. Meath) is at Newgrange. A great cairn of stones covers a megalithic corbel-roofed chamber almost 20 ft. high, which is approached by a passage more than 60 ft. long. The plan of the chamber is cruciform. The orthostats of the passage and chamber, as well as some of the roofing stones and the stones of the curb surrounding the cairn, are richly ornamented with carvings of spirals, concentric circles, lozenges, chevrons, and many other abstract patterns in the style distinctive to passage-grave art in Ireland and Brittany and closely related to the art style found on objects in Spanish and Portuguese tombs.

Bibliog. G. Coffey, New Grange (Brugh na Boinne) and Other Incised Tumuli in Ireland, Dublin, 1912; R. A. S. Macalister, New Grange (Official National Monuments Guide), Dublin, 1929.

Tara. This village (Co. Meath) is famous for its hill, for many centuries, according to tradition, a royal residence and gathering place for the people. Six terraces appear on the hill. The principal terrace is the Fort or Enclosure of the Kings (Ráth na Ríogh), on which are found Cormac's House (Teach Cormac), named for a king who lived in the middle of the 3d century B.C., the Royal Seat (Forradh), and the Mound of the Hostages (Dumha na nGiall). This last monument was attributed to Cormac MacArt, who brought hostages to Tara; in fact, it predates the Royal Enclosure, and tombs of the middle Bronze Age have been discovered there. North of the Royal Enclosure is the Enclosure of the Synods (Ráth na Seanad), where, it is said, St. Patrick held a synod. This terrace consists of three concentric banks with three ditches. Farther to the north appears the Banquet Hall (Teach Miodhchuarta), in which is recognized the great house with twelve or fourteen doors described in literary sources. Other terraces (Claoin-Fhearta north, Claoin-



Tara hill, plan. Individual remains and monuments with the traditional names: (*a*) Fort or Enclosure of the Kings (Ráth na Ríogh); (*b*) Cormac's House (Teach Cormac); (*c*) Royal Seat (Forradh); (*d*) Mound of the Hostages (Dumha na nGiall); (*e*) Fort or Enclosure of the Synods (Ráth na Seanad); (*f*) Banquet Hall (Teach Miodhchuarta); (*g*) Grainne's Fort (Ráth Ghráinne); (*h*) north sloping trenches (Claoin-Fhearta north); (*i*) south sloping trenches (Claoin-Fhearta south); (*j*) King Loiguire's Fort (Ráth Laoghaire); (*k*) stone fragments; (*l*) church.

Fhearta south, and Ráth Ghráinne), surrounded by a bank and ditch, were probably tombs, but it is supposed that they were also treated as houses. South of the Enclosure of the Kings is King Loiguire's Fort (Ráth Laoghaire), which takes its name from the king of St. Patrick's period. Also on the hill are other smaller tombs, and it is possible to find some traces of what may be ancient roads.

ISLAM. Islam may be regarded both as the religion founded by Mohammed and as a way of life which has shown itself capable of absorbing and reconciling peoples of the most diverse origins. The cultural unity fostered by Islam necessarily embraces the sphere of artistic creation. Drawing heavily on the creative forces of conquered countries, Islamic art in time produced from these various sources a new whole whose origins are no longer immediately evident. Islamic art received contributions from the ancient traditions of the Near East (see ARABIAN PRE-ISLAMIC ART; ASIA, WEST), from Iran (see IRANIAN PRE-SASSANIAN ART CULTURES; SASSANIAN ART), from the Hellenistic and Roman worlds (see HELLENISTIC ART; ROMAN ART OF THE EASTERN EMPIRE), from Byzantine civilization (see BYZANTINE ART), from central Asia and Indian traditions (see ASIA, CENTRAL; INDIAN ART; INDO-IRANIAN ART), and finally from the regional and folk trends that emerged in various parts of the Islamic empire. Islamic art may first be distinguished shortly after the age of the Arab conquests, the second half of the 1st century of the Hegira. (The inception of this phase may be conveniently fixed at A.D. 661, the date of the transfer of the Ommiad caliphate to Damascus in formerly Byzantine Syria.) Despite periods of decline and stagnation, the continuity of Islamic art has been preserved up to the present.

This article deals with the common aspects and features of Islamic art in its main lines of development. The several dynastic and historical periods, local developments, and marginal episodes of cultural exchange with other artistic traditions are treated in the following articles: ABBASSIDE ART; FATIMID ART; GHAZNEVID ART; ILKHAN ART; INDO-MOSLEM SCHOOLS; MAMELUKE ART; MOGHUL SCHOOL; MOORISH STYLE; MOZARABIC ART; OMMIAD SCHOOLS; ORIENTAL MODERN MOVEMENTS; SAFAVID ART; SAHARAN-BERBER CULTURES; SAMANID ART; SELJUK ART; TIMURID ART; TULUNID ART; TURFAN; TURKISH ART.

SUMMARY. Introduction (col. 325). Political background (col. 326). Sociological factors (col. 328). Art and religion (col. 332). City planning (col. 333). Religious architecture (col. 336). Secular architecture (col. 342). Architecture and decoration (col. 347). Ornament (col. 350). Organization of labor (col. 354). Handicrafts (col. 356).

INTRODUCTION. Research in the field of Islamic art is a relatively recent endeavor which has undergone varied phases. The romantic fascination with the Orient of the first half of the 19th century was followed only gradually by a more sober and realistic effort toward tracing the historical development of Islamic art. The effort had to be entirely centered upon the evidence revealed by the monuments themselves, insofar as they have been preserved, and upon extant handicrafts. Comprehensive historical accounts by ancient authors, such as those preserved for the arts of China and classical antiquity, are entirely lacking in Islam, and there are no writings dealing with the esthetic and philosophical implications of Moslem art. Oriental historians and geographers occasionally mention a few details concerning individual architectural enterprises, which assume special importance in those instances where the monuments described are no longer preserved, but such descriptions are seldom reliable. Fantastic accounts and poetic effusions concerning magnificent palaces are plentiful, but they are obviously of limited value for objective investigation. Similarly the occasional praise of the level of craftsmanship attained in this or that city is not a reliable basis for general conclusions.

Authors of European training are further handicapped by inadequate background in Oriental religions, history, and languages. This lack is especially evident when these writers approach their task with the bias of a humanistic or a Christian point of view. Few achieve enough comprehension of the nature and basic concepts of Islamic art to allow them to interpret its real meaning.

Many gaps in the knowledge of Islamic monuments have been filled by evidence accumulated from field expeditions and excavations, especially since the beginning of the 20th century. Through thorough investigation, whole groups of monuments have been uncovered and technical procedures clarified. The relationship between Moslem and Western developments has also been elucidated to a large extent, and reliable surveys have considerably broadened the understanding of Islamic art. Although Arab, Persian, and Turkish scholars also began in the first half of the 20th century to be concerned with the history of art in their respective lands, they followed the patterns established by their European colleagues. A deeper understanding of the basic values of Islamic art has thus far failed to emerge, while the progressive adoption of Western ways in the Orient offers little hope for future progress along these lines.

POLITICAL BACKGROUND. Mohammed and his first disciples led a very simple life in Medina and were not driven by the ambition to build monumental and luxurious structures as a manifestation of their continually growing power. Only with the transfer of the caliphate to Damascus by the first of the Ommiads in A.D. 661 (see OMMIAD SCHOOLS) did the need to rival the existing pagan temples and Christian churches of the capital city assume prime importance. It soon became clear that the head of the faithful could not be content with the modest expenditures of a patriarchal Bedouin sheik if he wished to equal in splendor his fellow rulers, especially the Byzantine emperor. The necessity arose for a regular court to perform its own imposing ceremonials in appropriate surroundings.

Thus, toward the end of the 7th century a vigorous architectural and decorative art production based in part on Byzantine, Sassanian (see SASSANIAN ART), and Coptic (see COPTIC ART) influences, yet with its own original aims, began in earnest under the Ommiads. This activity was most clearly exemplified in the elaboration of a mosque plan, which was immediately taken up in all lands ruled by Islam at that time, including Syria and Palestine, Iraq, Iran, Egypt, and northern Africa. The first Islamic style received the stamp of the ruling dynasty, and the subsequent evolution of Islamic art remained traditionally bound up with political developments.

In the year 750 an important change took place through the forcible assumption of power by the Abbassides, with the transfer of the center of rule to Iraq (see ABBASSIDE ART). The immediate consequence was the cleavage of Islamic unity through secession of the Moslem territory of Andalus (Spain), where, in 755, the only surviving member of the Ommiad house established a capital in Cordova (Córdoba; see MOORISH STYLE). The artistic significance of this event was reflected in the survival of an Ommiad element in the Islamic West (Maghrib) until the 11th century, while in the eastern parts of the Islamic empire, ruled by the Abbassides from their new capital of Baghdad, an entirely new style, influenced by Persian and Turkish art, was elaborated. After the beginning of the 10th century, the propagation of this style met with resistance in the resurgent power of the Iranian princes [Samanids, Ziyarids, Buyids (Buwayhids), etc.], who challenged the weakening central authority wielded by the Abbassides. In the literature and art of Persia, this resistance to Arab culture was translated into a revival of the great national past, partly focused on a new interest in the Sassanian tradition. These developments received an added impulse in the spread of the Shiite movement, a formidable new adversary to Abbasside orthodoxy.

In North Africa, the Shiite movement was encouraged in the 10th century by the Fatimid rulers, who in 970 transferred their capital from Mahdia in Tunisia to the newly founded city of Cairo and ousted the Abbassides from Egypt, Syria, and Sicily. Cairo became at this time the leading cultural center of the Islamic world, and its artistic influence was felt even in the lands of Western Christendom (see FATIMID ART). In the Maghrib proper, Fatimid rule in the last years of the 11th century was ended by the Morocco-based reform movement of the orthodox Almoravide Berbers and their followers the Almohades. Under the Almoravides and the Almohades, who ruled Spain as well as Morocco, the florid and overcomplicated manner of Ommiad art gave way to the more sober Moorish style, which is best exemplified by the royal capitals of Marrakech and Seville.

In the East, a new political pattern was created by the rapid conquest of Near Eastern lands by the Seljuk Turks,

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

who originated in Turkistan, took Anatolia from the Byzantines, divested the caliphs of Baghdad of all their territories, and established regional dynasties all over the East. The foundation of a Christian state by the Crusaders in the Holy Land did the Seljuks only slight injury. The Seljuks brought with them to Iran the Sunnite orthodoxy, the faith to which they had been converted, and their own artistic preferences; but although they sought religious converts, they seem to have been tolerant of the artistic inclinations of the Persian architects and craftsmen they employed (see SELJUK ART).

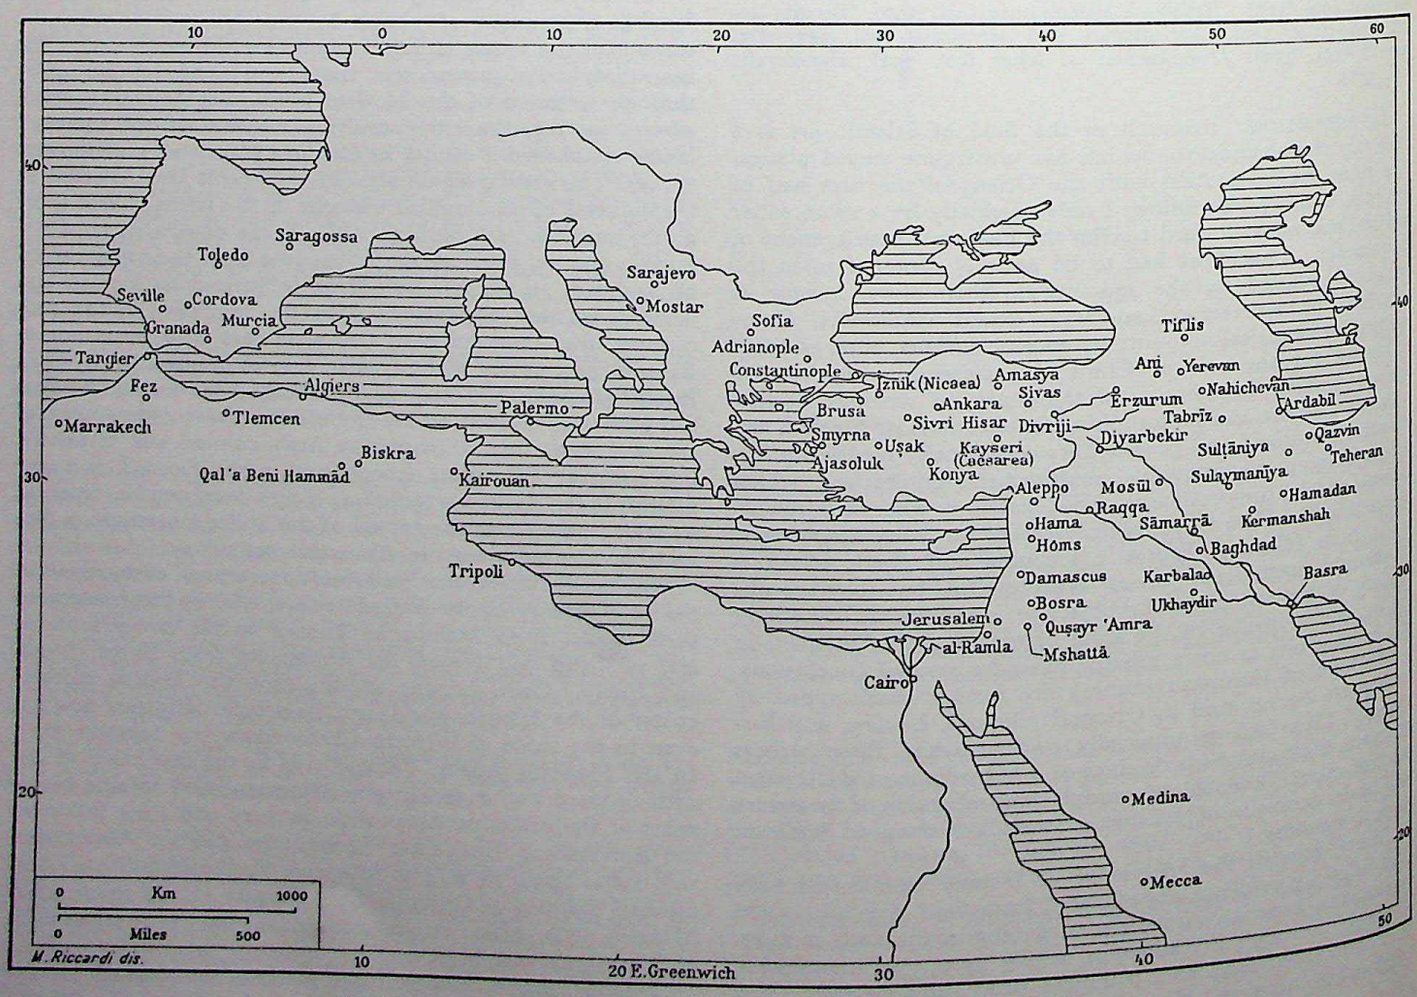
The year 1250 was a turning point for the Islamic world in a number of ways. At this time, Spain was reconquered by the Christian states of the West, leaving only the isolated kingdom of Granada in Moslem hands. Here and in the North African cities of Fez, Tlemcen, and Tunis, Moorish art reached its highest peak. In Egypt and Syria, after a brief Sunnite reaction under the Ayyubids, political power passed into the hands of the Mamelukes, who were able to impose a clear and distinctive artistic policy for two and a half centuries (see MAMELUKE ART). In Asia, the Mongolian invasions brought on not only a complete change in the political situation but also added Chinese influence to the stream of Turkistan, Persian, and Mesopotamian art (see MONGOLIAN ART). In India this wave was broken by the resistance of the sultans of Delhi. The Persian-Mongolian trend enjoyed new life through the conquests of the great Tamerlane (Tīmūr Lenk), who transformed his capital in Samarkand into a great art center. Under his successors, architecture and painting came into full flower (see TIMURID ART).

About the year 1500, the medieval period of Islamic art came to an end. After the fall of Granada (1492), Moorish art, bereft of creative ideas, was confined to Morocco. Furthermore, the Islamic countries around the Mediterranean were overpowered by the Ottoman Turks, who followed their conquest of Constantinople (1453) with a determined push westward. The Ottomans, who had occupied Egypt, Syria, and Arabia, were able to subjugate Tunisia and Algeria as well, and they saw to it that the new artistic trends they had developed in Anatolia and Constantinople spread throughout Islam (see OTTOMAN SCHOOLS).

A national renaissance took place in Persia under the Safavid dynasty, centered first in Tabriz and later in Isfahan. Its effects were felt in all areas of artistic life. The production of textiles, which was brought to an unparalleled level of refinement, as well as great undertakings in landscape and garden architecture, evoked the admiration of all Europe. Under the descendants of Tamerlane, who in the 16th century founded the Moghul empire in India, an attractive synthesis of Persian and Indian elements was gradually transformed into an original Indo-Islamic style (see MOGHUL SCHOOL).

By the 18th century, the history of Islamic art was terminated even in the countries which had witnessed its last flowering. Handicrafts were unoriginal and derivative, produced mechanically merely to meet the need for bazaar merchandise, while in architecture, the success of the westernized style initiated in Turkey gradually made Islamic architecture subservient to European developments.

SOCIOLOGICAL FACTORS. More than any other religion, Islam was able to absorb the ethnic and national differences of its adherents and to create a fairly unified culture out of varying customs and traditions. This unifying factor was instrumental in integrating local styles into an artistic development of uncommon homogeneity. The Koran played an essential role in this development, not only as a source of divine revelation for Mohammedans but also as a guide in legal, social, and cultural matters. Since the Koran could be taught only in the original Arabic, the language and script of the Arabs as well as their customs and traditions were transmitted throughout the Islamic world. Considering the fundamental ethnic and



Chief centers of Islamic art in the Mediterranean basin and in the Near East.

Chief centers of Islamic art in the Near East, India, and neighboring regions.

historical factors that separate Persians, Turks, Indians, and Berbers from Arabs, the revolutionizing power of the Koran is extraordinarily impressive. As a result, there were no individual national styles within Persia, Turkey, Arabia, or India as distinct currents in medieval Islamic art. Not until the dawn of the modern age (roughly speaking, from the 16th cent.) did Islamic art assume a national character in Iran, India, and Turkey. The important stylistic trends of the Middle Ages were linked primarily to dynasties. The direction of Islamic art was determined by political structures which cut across geographical and sociological boundaries. Nevertheless, the local traditions of individual societies contributed to the total development of Islamic art, sometimes in the form of a rebellious reaction. In this connection it is important to evaluate the contribution of the Arabs themselves to Moslem culture, above and beyond language and script. It is true that Arab art developed a specific identity and creative force only in the wake of Arab conquest, but the art that was then produced in Arabia owed as much to the specifically Arabic sensitivity as to the new, universal religion. A strongly marked sense of rhythm pervades not only the poetry of the Arabs, which was diffused through all social strata, but also their music. This sense of rhythm is a basic element of their art, without which it can scarcely be understood. Their interest in astronomy, nurtured in the course of endless wars and wanderings, led the Arabs to mathematical speculation, while the monotony of the desert stimulated them to flights of fantasy. A romantic yearning for endless vistas motivated the Ommiads, once they had become permanently settled, to build castles not in their cities but in the desert; and Ommiad ornament is noted for surfaces filled with endlessly repeated and elaborated decorative patterns, an esthetic that finds parallels in both poetry and music.

In Syria and in Iraq, the ground for the acceptance of new ideas had been prepared by the settling of the Ghassanids and Lakhmids, peoples related to the Arabs who had been earlier driven from the Arabian peninsula. They had been converted to Christianity, but their acceptance of the Monophysite creed placed them in opposition to the Byzantine empire. The caliphs willingly placed these adherents of Nestorianism in the highest administrative posts of government; they were locally influential people with a deep understanding of past tradition and considerable sympathy for early Islamic arts. Thus, despite religious antagonisms, Arabic customs and manners won general acceptance.

Of all the territories conquered by Islam, Spain adopted Islamic culture most swiftly and in the profoundest sense. The art of the Visigoths, the previous conquerors of the Iberian Peninsula, had not penetrated the native culture to a significant degree before the Moslem invasion (see MOZARABIC ART). The horseshoe arch, overladen with geometric decorative motifs, was not regarded as foreign to Arab taste and was immediately taken over by the invader and further developed. The effect of Islam in Spain was so strong that even the Christian population soon lost all marks of cultural and racial difference except their religion. Thus, in Spain, Arabic tradition blossomed into a regional culture of considerable importance, with new developments in both literature and art.

The situation was different in the Maghrib (in northwestern Africa), where, despite the cultural and political bonds with Spain that were maintained throughout the Middle Ages, the tenacious indigenous customs of the Berbers withstood Arabic pressure for a long time, retaining certain unique traits until the present day. Only gradually won over to the centralized orthodoxy, the Berbers retained many of their beliefs, such as their cult of saints, as well as peculiar magical practices. In the mountainous regions of northern Africa, the Berber element continues to dominate folk art, although this element should not be construed as entirely hostile to Islamic style.

UP State Museum, Lucknow

The style dominant in Egypt at the time of the Arab conquest, a mixture of ancient and Coptic elements, was perfectly suited to the demands of the Islamic ruling caste. In spite of religious antagonism, even objects produced for a Christian clientele were marked with the stamp of Islamic taste. A complete assimilation of various cultural strains may be said to have taken place, even though a certain number of age-old traditions, stemming in part from pharaonic times, were retained.

The new movement met its severest test in Iran. Contact with a proud people of high artistic achievement and ancient culture made a deep impression on the conquering Moslems and exposed them to the danger of submersion. When the Abbassides made Baghdad — near the former capital of the Sassanian rulers — the capital of the empire, the court ceremonial took on a distinctly Persian coloration. Administrative officials as well as individual caliphs, whose underlings more often than not were of Persian descent, readily adopted local fashions. In the realm of art this process of assimilation took place through the adoption of Iranian vaulting techniques in building and a similar incorporation of Sassanian painting and handicraft methods. The tolerance of the court of the caliph toward the old Persian heritage, a policy also followed at the courts of the relatively independent local princely rulers (Tahirids, Samanids, Buyids, etc.), led to a conscious revival of Iranian traditions in literature and art and helped to perpetuate them. Wherever possible, the cultural inheritance of Persian art was infused with new life, and customs thoroughly foreign to Islam were retained or were newly introduced. The adherence of the local population to the Shiite sect, which was opposed to rigidly orthodox observance, played an important role in the resistance to Arab ideas. By the time orthodoxy gained a foothold, through the conquest of the Seljuks in the 11th century, the Iranian element had become so deeply entrenched that it could no longer be uprooted. An original fusion of Persian and Islamic elements characterized subsequent art.

Scytho-Turkish ornament, an art of abstract, inanimate patternwork, was introduced into the Islamic world as early as the 9th century by the Turkish palace guards at the court of the caliphs. This art, exemplified by the stucco decoration at Samarra (PL. 151; I, PL. 4), exerted a strong influence on the court, even though it stood in contrast to the native Iranian current. The subsequent invasion of the Seljuk Turks brought to Persia a nomadic culture whose main artistic products were textiles and tentlike, domed, brick mausoleums. Undoubtedly, the most important artistic benefit the Islamic world gained through contact with the Turks was the knotted-carpet technique. It is not certain how long the nomadic tribes of eastern Turkistan, the inventors of this type of weave, had practiced their discovery before it was taken up by others, but the Seljuks adopted it at their court as early as the 11th century and encouraged its production by the great workshops. Thus the knotted carpet won acceptance in the Caucasus, in Persia, and especially in Anatolia (see TAPESTRY AND CARPETS). The Seljuks also introduced to Islam the heraldic motifs (see EMBLEMS AND INSIGNIA) that had originated in their feudal customs, while their highly developed garden art helped to stimulate in their successors, the Ottomans, a penchant for naturalistic floral decorative designs.

The development of Islamic art in India presents somewhat more complicated problems. The chief sponsors of this art were Persians and Turks, but a large majority of Indian Moslems had strong ethnic ties to those of their Indian neighbors with polytheistic creeds. This region of Islamic culture was dominated by a synthesis of Turkish and Persian styles, but the Hindu element was never completely overshadowed. The columned halls of the Jains (see JAINISM), examples of Hindu religious architecture whose relatively restrained decoration made them inoffensive to the Moslems, were used as mosques by the Persian conquerors at least until the 12th century. Islamic architecture in India was strongly influenced by Hindu attitudes toward the disposition of space. Although differences between court and folk art are most clearly revealed in craft techniques, painting, which had a decidedly Hindu character, shows this contrast in a very decisive manner.

In China, the influence of Islamic culture, which was introduced as early as the end of the 8th century, proved to be less decisive than in other countries, since converts to Islam, numerous as they were, remained Chinese through and through, adhering only superficially to the new faith. Their places of worship were entirely adapted to local taste, with curved roofs and Oriental decoration, and they differed little from conventional Chinese temples or yamen structures. Realizing that the Koran stands quite apart from the body of Chinese literary production, calligraphers evolved for Koran manuscripts a flamelike stylization of Arabic cursive writing, which gained a certain appreciation in the eastern Asian world. Nevertheless, the dynamism of Islam could not overcome the resistance of an ancient and well-established culture.

ART AND RELIGION. The ties that bound the Moslem to his faith shaped his entire existence, and the world as he saw it bore little resemblance to the world of the Christian. Although he admired the beauty of creation and its endless formal variety, the conception of the harmony of the universe as developed in classical antiquity remained foreign to him. His perception of the ephemeral character of all reality led him to regard its pictorial representation as an act of futility. Characteristic of this belief is the Moslem representation of Satan, who weeps over the beauty of the world because he cannot capture its fleeting shadow.

Unwilling to fix immutably the fleeting image, Moslem art was bound to renounce realistic genres. Consequently, painting and sculpture could not be used to create faithful portraits, lifelike representations of historical events, or accurate records of a ruler's deeds. Attempts at realistic depiction would have constituted a blasphemous affront to the divine prerogative of creation (see IMAGES AND ICONOCLASM). Other religious concepts derived from the severely monotheistic orientation of Islam also played a role in the realm of art. The risk of idolatry served as a deterrent against any form of representation which might have been used for cult purposes. Neither Mohammed, nor his ancestors, nor any holy personage could be depicted in his natural and worldly appearance, and the use of such pictorial aids to propagate the faith was unthinkable.

The oft-mentioned prohibition of pictorial imagery in the Islamic world should not be attributed to the Koran or to other pronouncements of a dogmatic nature. Rather, this prohibition was grounded in the very definition of the role of the arts within Islamic society. The iconoclastic controversy, which engulfed the Christian world in a lengthy religious struggle not resolved until the mid-9th century, undoubtedly played an important role in the formation of Islamic attitudes. Before the 8th century the imitation of human forms had met with little resistance in the Islamic world. In 721, however, iconoclasm was officially decreed by Caliph Yazīd II and became an important element in the propaganda that the caliphs directed toward dissident Christian factions.

At the same time, specific injunctions against the imitation of human and animal forms, together with instructions to the artist to confine himself to plant and abstract motifs, were culled from the collections of the sayings of the Prophet (Hadith), assembled by later writers. These sayings include: "Angels do not enter a house which contains a dog or an image"; "On Resurrection Day God will consider image-makers as the men most deserving of punishment"; "Those who make pictures will be punished on Resurrection Day; it will be said to them: Give life to what you have created."

Puritanic exegesis of such passages resulted in a strict prohibition of all figural representation, whereas the more tolerant interpretation held such strictures to proscribe only the setting-up of cult images. Adhering to the orthodox Sunna (tradition), the majority of the Moslem faithful followed spiritual leaders who were often sternly opposed to anthropomorphic imagery. The preponderance of this attitude undoubtedly accounts for the pronounced lacunae in the chronology of figural representations in Spain, the Maghrib, and Arabia proper, though not in Turkey and India, where adherence to the Sunna was less uncompromising. The followers of the Shiite sect were condi-

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

tioned by dogmatic tenets other than the Hadith accepted by the orthodox. These rigidly binding tenets, which were less severely opposed to figural art, were influential chiefly among the Persians, among some Iraqi Arabs, eventually among the Fatimids of Egypt, under whose rule an efflorescence of the figural arts took place, and ultimately among the Mongols.

It was by no means inevitable that the new faith should have developed a pronounced iconoclastic attitude. Aside from the limiting condition that painting and monumental sculpture eschew realism, the creative fantasy and imagination of the artist were allowed considerable scope. The less attention the artist had to pay to natural forms, the freer he was in his art. Artists continued to study human and animal forms, but since they were unable to use them except as dry, insignificant elaborations of inanimate main motifs, they preferred to limit themselves to geometric and plant ornament. Discussions took place among the partisans of the more tolerant tendencies within the faith over the acceptability of representation "without shadows," or of an entirely flat appearance. Certain authorities suggested that figural representations should be shown without heads, or pierced with holes, as were the figures used in puppet shows. Within religious sanctuaries, only indistinct hints of human or animal forms were tolerated, but in bathing establishments, paintings of hunting or of love scenes for the entertainment of patrons seldom aroused objection.

A characteristic treatment of figural motifs in Islamic art was to repeat them progressively within established ornamental bands. The sensitive artist did not treat the square or circle as a unified surface within which a single major element must dominate; rather, figural motifs were more likely to be disposed around the periphery of the form or within bands repeated several times over the two-dimensional surface. The individual motif thus lost its independence through a seemingly endless repetition and no longer served as a form of visual attraction. The esthetic intention of this art is not conveyed by individual details but only in the grouping of the entire decorative field in which the details are submerged.

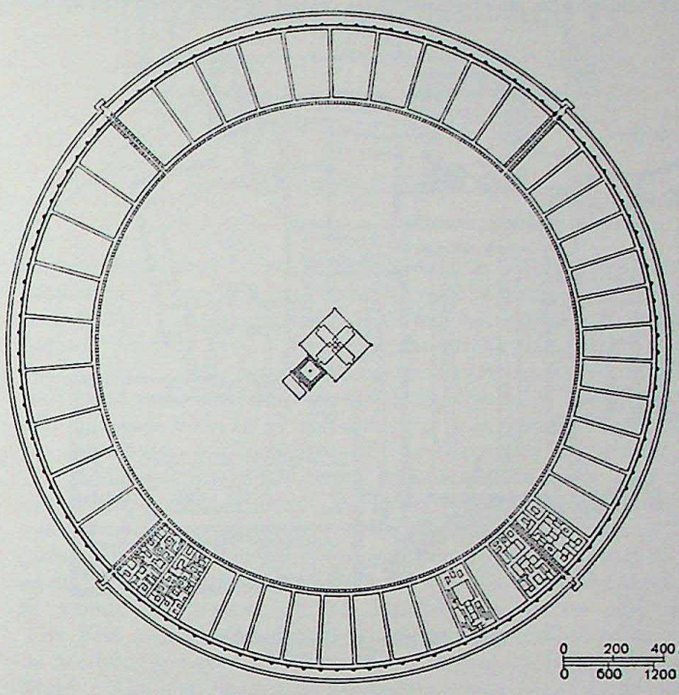
These principles were not questioned by the artists, nor were the relatively narrow confines of this art ever challenged. The leading artistic personalities appear always to have been aware of the norms enforced by tradition and the spiritual message of the Koran.

The contrast between the religious and the secular spheres of art, so sharply etched in the West, is of only minor importance in Islamic art. It is true that specific architectural forms were developed for buildings associated with the religious cult. Decorative principles, however, remained much the same for profane as for sacred structures. In contrast to Christian practice, liturgical vessels and furniture were not used in Moslem services. The movable objects encountered in the mosque, such as the rugs on the floors, the hanging lamps, the pitchers and water containers for ablutions, and the vases for flowers, were identical to those used in private houses. These objects were not essential, and even a copy of the Koran was not always on hand, since the recitation of the services was carried on from memory. Pious donations of luxurious manuscripts of the Koran were occasionally made, and these might be kept in finely wrought containers (V, PL. 458; IX, PL. 275), or upon stands executed for this purpose (PL. 155; X, PL. 119).

CITY PLANNING. When the Arabs settled in newly conquered cities, they carried out few changes in the established architectural arrangements. Perhaps old buildings were torn down, but the general arrangement of the city remained the same. New settlements, where nomadic warriors had to be transformed into city dwellers, were generally little more than primitive encampments fortified with mud walls, studded with towers, which sheltered the tents of the inhabitants.

The first settlements of a specifically urban character to arise in Iraq after the Islamic conquest were Basra and Kufa. Both were founded about 638 and soon emerged as important centers of culture. Basra, erected on an elevated semicircular site near the Tigris, was divided into separate areas according to garrison units. It was connected by two shipping channels to the river and soon developed into a center of trade. The city was entirely destroyed and reconstructed several times, so that the original disposition can no longer be discerned.

Kufa was constructed as a garrison city on the edge of the desert not far from Hira, the capital of the Lakhmids. The fortified palace of these Arabs, who had been Christian converts prior to the coming of Islam, became the model for some of the desert castles of the Ommiads. The Great Mosque



Baghdad, plan of al-Manṣūr's round city (*after F. Sarre and E. E. Herzfeld, 1911–20*).

of Kufa was erected partly with materials looted from Hira. The relationship of the rulers of Hira with the Sassanians was especially close, and pronounced Iranian influences are evident in their domain. ʿAlī ibn-abī-Ṭālib, the fourth caliph and the son-in-law of Mohammed, resided in Kufa and was murdered there in 661. The Shiite schism was a direct consequence of this murder, since the followers of ʿAlī had recognized him as the sole legitimate heir of Mohammed.

The Abbassides, after seizing the caliphate, established a new capital, Baghdad, near Ctesiphon, the old stronghold of the Sassanians. The plan of Baghdad, designed for Caliph al-Manṣūr, was circular in form. Such a design was not new in the East since the Hittite city of Zincirli, the Parthian city of Hatra, and originally Ctesiphon as well were based upon circular plans, but the builders of Baghdad consciously elaborated a thoroughly new type of plan, which they carried out consistently in execution (FIG. 334). Geodetic and astrological considerations were of fundamental importance for the choice of building site and the time of construction. The ground plan was eventually outlined on the site with ashes, and between 762 and 766 the city was built; sun-dried bricks and spoils from Ctesiphon were used in construction.

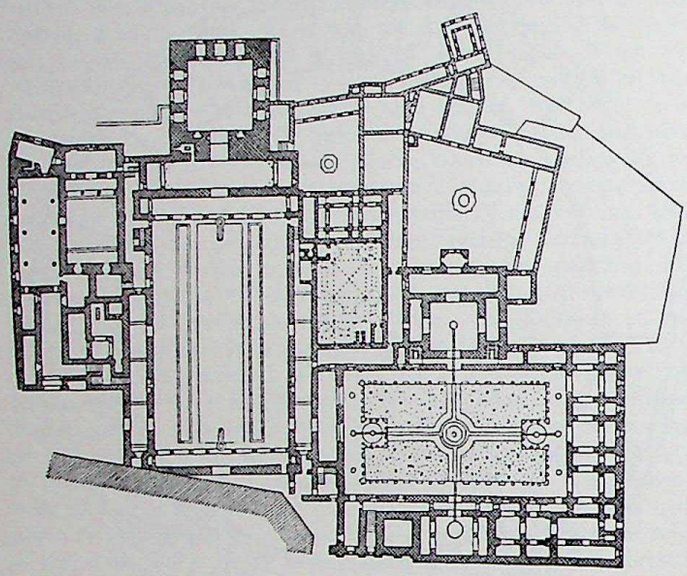
The new circular city was enclosed within massive walls with round towers and a thinner outer wall. We are well informed about the appearance of the city through the comprehensive description provided by the geographer Yaʿqūb at the end of the 9th century. Four narrow, brick-vaulted passages, which led from the gates to the inner circle, were connected to one another by two streets following the outer and inner circumferences of the city respectively. These passages divided the city into four parts, each of which was further pierced by eight to twelve radial streets. Between these were individual passages with gates, linking stores, workshops, houses, schools, and mosques. The inner circle within the city, framed by arcades, was an open space in which the palace of the caliphs

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

and the main mosque stood. The original plan of Baghdad, however, was considerably altered in subsequent reconstructions, and al-Manṣūr's design has long since disappeared. The same caliph also experimented, in 772, with a horseshoe city plan at a site on the Euphrates near the old city of Raqqa. The mud walls, fortified by towers, are still visible.

Two days' journey north of Baghdad stood the city of Samarra, the capital of the Abbassides from 838 to 889 and one of the most impressive urban centers ever constructed



Granada, plan of the Alhambra.

by man. Samarra was thoroughly explored by German excavators between 1910 and 1914. Originally only a garrison settlement for the Turkish militia with the palace of the caliphs located in the center, Samarra was rapidly enlarged through the construction of new residential sections and ultimately came to occupy an area some $20^1/_2$ miles in length and a little more than a mile in width along the Tigris. Everything connected with the court was concentrated here, and a large part of the population of Baghdad migrated to the newer city. Owing to this somewhat haphazard growth, the huge but short-lived settlement does not reveal a systematic plan.

Medīna az-Zahra, founded near Cordova (Córdoba) in 936 by 'Abd-er-Raḥmān III, is next in the chronological sequence of important city building projects undertaken by the Moslems (X, PL. 163). Built on an elevated site, this new capital gradually attracted traders and handicraft workers, and became an independent urban center in its own right. The excavations being carried out under Spanish auspices are not far enough advanced, however, to give a clear impression of the over-all plan of the city with its interesting arrangement of palace, mosque, and bazaars. The city was destroyed in 1010, and thus its lifetime was much longer than that of Samarra.

We are somewhat better informed concerning the capital of Cairo (al-Qahira), constructed in the immediate vicinity of the older city of Fostat by the Fatimid al-Mu'izz after the conquest of Egypt at the end of the 10th century. Cairo occupied an area of about 920 sq. yd. and was surrounded originally by a wall of mud brick. Between 1087 and 1093, Syrian architects built a more massive fortification wall based on Byzantine models. The new wall, composed of ashlar blocks, was reinforced by square towers and had four majestic entrance portals, three of which are still preserved (V, PLS. 245, 247). Within this enclosure, which was divided by a wide street running north and south, troops, court personnel, and officials of the administration were housed. Barracks, mosques, and living quarters were grouped around two palaces located opposite each other within a complex of government buildings that have since disappeared. Following the destruction of Fostat and the end of the Fatimid dynasty (1171), the original urban complex lost its purpose and was swallowed up in the growing city of Cairo.

Little is known of the cities constructed by the Seljuks. New foundations were on the whole avoided, since the sultans and their atabegs preferred to establish themselves in preexisting cities. It can no longer be determined whether the building of the wall of Konya in Anatolia in 1221, with 108 towers, also involved the large-scale replanning of the city as a whole. The Mongols, on the other hand, laid out wide boulevards in their city with great care and probably instituted other fundamental changes in city planning as well. None of their projects, however, has survived as it was executed. Through the sources it is known that Vizier Rashīd al-Dīn erected a whole university complex with individual colleges, a library, housing, shops, and other facilities outside Tabriz.

Tamerlane drew construction workers and artisans from all the lands he conquered to Samarkand, in order to make the seat of his capital ever more splendid. It is not known whether the appearance of the city was originally much different from that of today. The main center was the relatively small Rigistan, a square faced by three great madrasah constructions that dominated the town with their elevated portals and gave a special character to the largely preserved burial street of the city.

In the 13th century, the kings of Granada in Spain built a capital upon a hill overlooking the metropolis, the Alhambra (Ar., al-Ḥamrā'), which in the course of the 14th century came to include a fortified palace complex (PL. 149; X, PLS. 166–168, 171) with gardens, a burial ground, and various other elements, among them a mosque and streets with shops. The entire complex was surrounded by its own wall (FIG. 335).

Following the conquest of Constantinople, the victorious Osmanlis (Ottoman Turks) proceeded gradually to build a residential palace. Various elements were grouped without a defined arrangement, and the over-all ground plan gives the impression of having emerged more or less by chance.

Impressive city plans always bear the imprint of strong personalities. This was indeed the case for the city of Isfahan in Persia, built in the 16th century by Shah 'Abbās I as his imperial capital. The town was dominated by an imposing square surrounded by a continuous row of two-storied liwan arcades pierced in the center of each side by a high entrance portal. One of these led to the palace complex, which was located within a huge park and was methodically arranged as a group of graceful pavilions of varying design. From there, extending as far as the Hazār Jarīb garden, almost 2 miles to the south, was the Chaḥār Bāgh with its palatial apartments, kiosks, and fountains. A canal flowed through the entire length of the complex, which was framed by rows of plane trees and closed off at both ends by pavilions; other streets ran parallel to this impressive promenade. Great bridges spanned the river and gave to the city an outstanding and original character. Later additions conformed to the system established at the outset, and even today the silhouette of the city forms an impressive panorama.

In India, the emperor Akbar founded the city of Fatehpur Sikri in 1569 on the outskirts of Agra and resided there until 1583. The city was surrounded on three sides by a wall about 3 miles in length, while the fourth side was closed by an artificial lake. A number of palaces were built, each designed as part of a general plan (X, PL. 113). Other buildings, including mosques, bazaars, and service quarters, were never used again and thus have survived in a relatively good state.

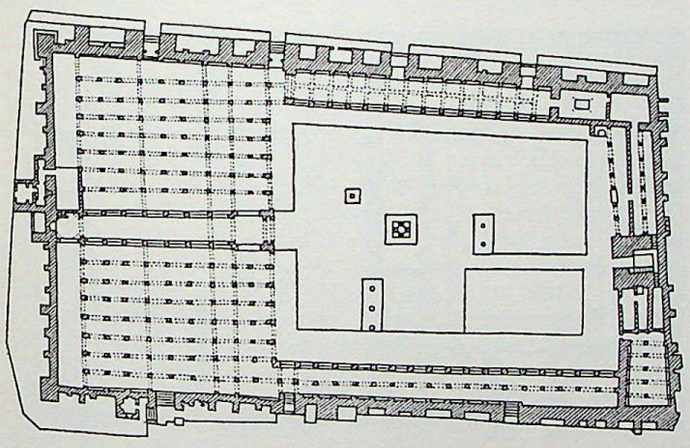
RELIGIOUS ARCHITECTURE. Of all Islamic religious architecture, two buildings stand out because of their extraordinary importance to the Islamic world and because they demanded a special ritual: the Kaaba in Mecca and the Dome of the Rock in Jerusalem (PL. 146; X, PLS. 182, 377, 385). The first of these was originally only a modest enclosure sheltering the Black Stone which had been treasured by the Arabs in pre-Islamic times, but when it became the perennial goal of thousands of pilgrims from the entire world, the enclosure was hung round with a splendid curtain that was replaced every year, and it was gradually surrounded by numerous structures

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

erected to meet the practical necessities of an important center of worship. Artistically more important, the Dome of the Rock in Jerusalem was erected in 691 by Caliph 'Abd-al-Malik over the holy rock which Jews regarded as the foundation stone and axis of the world and Moslems as the spot of the Prophet's mystic ascent into heaven. The building is octagonal, with a double inner colonnade supporting a wooden dome mounted on an elevated drum. The use of the central plan, undoubtedly inspired by the desire to create a pilgrimage center to rival Mecca, politically apostate at the time, was also partly influenced by the centralized Christian churches of Jerusalem. Neither the Kaaba nor the Dome of the Rock conforms to the plan of the typical mosque.

Mosques were constructed as assembly halls for the faithful (PLS. 146, 161, 163, 170; FIGS. 337, 338, 341). They served primarily for the recitation of prayers in common, a practice which from the very beginning of Islam was of great importance, even though the faithful were permitted to fulfill this religious obligation in the home, workshop, or outdoors. The obligatory Friday sermon (khutbah) was delivered in the larger mosques, and certainly in the leading mosque, of every city. Moreover, mosques were used for religious instruction, for certain memorial services, as hostels for traveling scholars, as places of asylum for the persecuted, and sometimes for teaching. In certain areas, above all in villages, they served as community houses, affording shelter and cooking facilities for



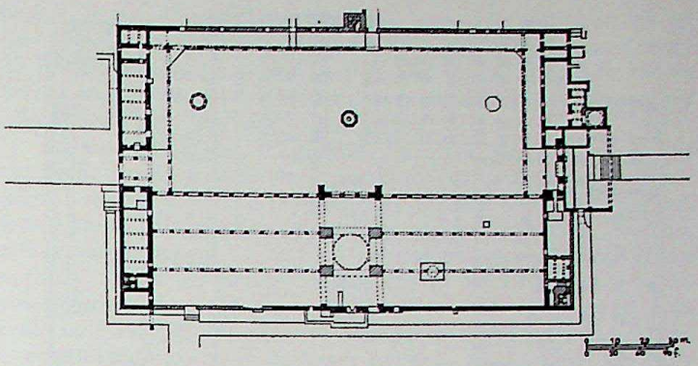
Kairouan, plan of the Great Mosque.

traveling pilgrims. If a mosque had been endowed as a memorial to a deceased person, his tomb was established on the premises.

The plan of the mosque was based on the so-called *muṣallā*, a simple walled precinct used for prayers in pre-Islamic times. Its orientation (*qibla*) was changed and directed toward Mecca by Mohammed, a feature that became canonically binding in all Islamic places of worship, although it was not always exactly followed. In many cases, Christian basilicas were transformed into mosques simply through a change in orientation. In some instances, this was accomplished by constructing a *qibla* wall through the room.

The first large mosques had a skeleton of palm stems and clay and were faced with palm leaves and clay, but it soon became necessary to build more elaborate structures to provide larger numbers of the faithful with protection from the sun, as well as from enemy attack. For this purpose, the outer walls were strengthened and reinforced with towers and crenelation. This type of fortresslike mosque remained in use even after the triumph of Islam rendered the defensive function of the mosque obsolete.

The ground plan of the early mosque already showed the basic characteristics of the more solidly built and widely distributed courtyard mosques. These were distinguished by a large square or rectangular courtyard (*ṣaḥn*), oriented toward Mecca and closed off by means of a more or less elaborate prayer room (*ḥaram*). The flat roof, constructed with beams and planks, rested on round or horseshoe arches, which were

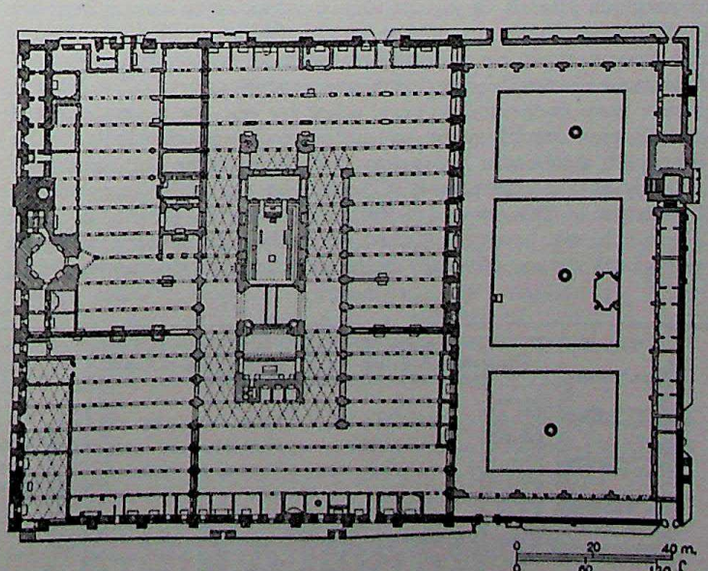


Damascus, plan of the Great Mosque.

in turn supported by columns disposed in regular rows either parallel or perpendicular to the *qibla* wall. Columns and capitals were taken from ancient buildings, often without much discrimination. Variety in the height of the shafts was compensated for by adjusting the height of the bases or by inserting additional moldings under the capitals. The courtyard, in the center of which stood a fountain for ablution, was usually surrounded by an arcade and sometimes by several rows of arcades.

The *qibla* wall of the prayer hall was at an early date provided with a niche (mihrab), probably modeled on the Christian apse but without the liturgical significance of the latter. This niche did not protrude on the exterior of the building; it was of secondary importance and served only to mark the direction to which the prayers of the faithful were to be addressed. The first mihrab was installed in the memorial mosque built in Medina in honor of Mohammed in 694 by Caliph 'Abd-al-Malik. The significance of the niche, which could be of stone, marble, wood, stucco, or ceramic material, was emphasized by decorative effects and by its position as the culmination point of the hall (PLS. 18, 88, 147, 148; VII, PL. 403; IX, PL. 272).

The required furnishings of the Friday mosques were a raised podium, from which the Imam (the leader in prayer, considered also to be commander of the faithful) could address the congregation, and an imposing lectern (mimbar), the latter undoubtedly based on the ambo of Christian churches (IX, PL. 272). The mimbar usually stood to the right of the prayer niche; it was generally made of wood and hence portable, although sometimes it was constructed of stone or marble. The mimbar was later adopted in mosques which were not intended for the Friday sermon. In addition to the mimbar and the mihrab, a number of mosques were outfitted with a loggia for



Cordova, plan of the Great Mosque.

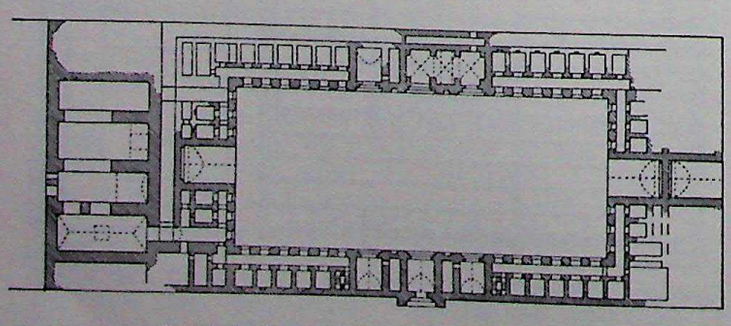
Isfahan, plan of the Masjid-i-Jāmiʿ.

the nobility (*maqṣūra*), separated from the space of the congregation by a wooden screen. At a later date, the larger houses of worship were provided with a raised platform (*dikka*) to make the officiant visible to the congregation (V, PL. 458).

When the caliphate was transferred to Baghdad, in the vicinity of Ctesiphon (the previous capital of the Sassanian rulers), some local architectural practices, such as the use of fired brick and the employment of a somewhat depressed pointed arch, were taken over by the Moslems. Less frequent use was made of looted columns, since round or rectangular brick piers became the rule. Stucco encrustation was used for decoration and Islamic builders adopted their own variation of the chalice capital. In Persia, where the courtyard type of mosque is also found, contact with Zoroastrian fire temples led to the development of the so-called "kiosk" type, which was composed of a domed space preceded by an anteroom known as the liwan. The liwan mosque, adopted by the Seljuks in Persia in the 11th century, was an outgrowth of this earlier form, although it was also influenced by an Iranian development, the so-called "madrasah" plan.

The madrasahs (FIGS. 339, 340) were developed in Persia as religious schools of jurisprudence intended to strengthen the Sunnite sect in its opposition to the Shiites. Their buildings are characterized by a cruciform plan in which the arms are four large liwans leading onto the central court. The liwans, which were connected to each other by one- or several-storied dormitories, could serve as audience or prayer halls. The first such madrasahs are believed to have come into existence as early as the year 1000 in Ghazni. In especially large establishments of this type [in Isfahan, Baghdad (I, PL. 6), and Cairo (IX, PL. 270)] the liwans, with their adjoining residential complexes, were divided between the four orthodox rites

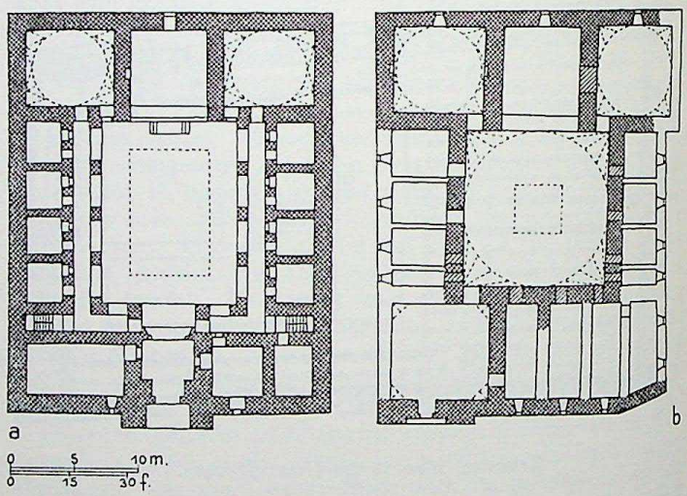


Baghdad, plan of al-Mustanṣiriya Madrasah.

(Malikite, Hanafite, Hanbalite, and Shafiite). In smaller institutions this profusion of liwans was unnecessary, and they were provided with only one or two. The madrasahs of Persia and Iraq were adopted more or less unchanged in Syria, Egypt, and Anatolia. In the Maghrib, they were completely altered to fit traditional Moorish architectural thinking.

In Persia, almost all large mosques erected at this time were based on the madrasah plan. The main liwan was enlarged into a prayer hall and eventually was emphasized through the addition of a dome. Such an addition was bound to create difficulties, and the dome in some cases overshadows the entire structure. In Anatolia, a simpler arrangement — a domed hall preceded by a narthex — prevailed until the 15th century. Only after the conquest of Constantinople in 1453 were steps taken toward grandiose solutions, in the style of St. Sophia, calling for a central dome surrounded by half domes and smaller cupolas. This development reached its high point in the 16th century in the work of Sinān (q.v.; PL. 161; X, PLS. 444-447), chief architect of Sulaymān the Magnificent.

An indispensable feature of the mosque today is the minaret, which was introduced under the Ommiads, less for practical than for formal reasons (PLS. 150, 162, 164; FIG. 343). The minaret was not a prescribed element of the cult edifice, as the call to prayer could be made from a high roof or from the city wall just as easily. In certain regions of Arabia, neither simple village mosques nor larger structures were provided with



Konya, madrasah plans. (*a*) Sırçalı; (*b*) Büyük Karatay.

such towers. It is unlikely that the towers of Syrian churches played a role in the introduction of the minaret. The derivation of the term, which was first applied to the signal or light towers (Ar., *manāra*) frequently found in the East, in the interior as well as along the coast, suggests the general type within which antecedents are to be sought. The most famous of these towers, the Pharos of Alexandria, known to all travelers on the sea, was the model for a large number of minarets, especially in Egypt. The base of each of these structures was square, with an intermediate octagonal element topped finally by a cylindrical shaft.

The earliest minarets were generally placed at the front of the courtyard, on the axis of the mihrab, but they were sometimes built in a corner of the courtyard or entirely outside the mosque. Access to the upper parts of the tower was by means of an inner staircase or ramp. A 9th-century mosque in Samarra, which has an outer spiral stairway, is an exception to this rule (I, PL. 11). In the West, the minaret was always square in plan and tapered toward the top. In Iran, on the other hand, a cylindrical form of minaret was in common use. In the Seljuk period, when the minarets were joined to the front of the liwan, for reasons of symmetry two were built, although only one was actually used for the prayer call. The Persian variant was taken up in Turkey, where it evolved into a slender, needlelike projection interrupted by parapet galleries.

UP State Museum, Lucknow

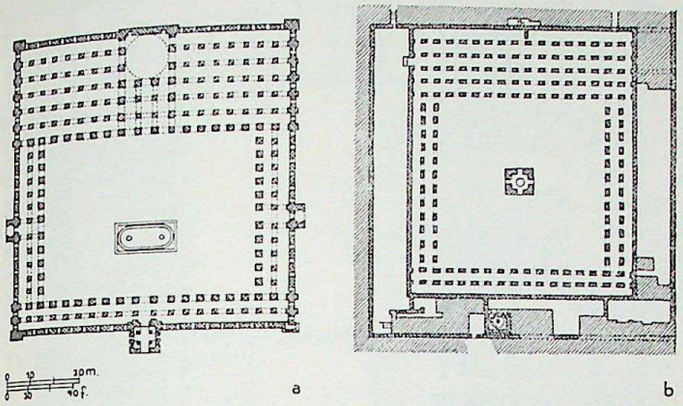
Monastic establishments were also found in the Islamic world. The oldest and most important of these were the ribats, fortresslike structures housing militant orders who propagated the faith through holy war and needed protection against

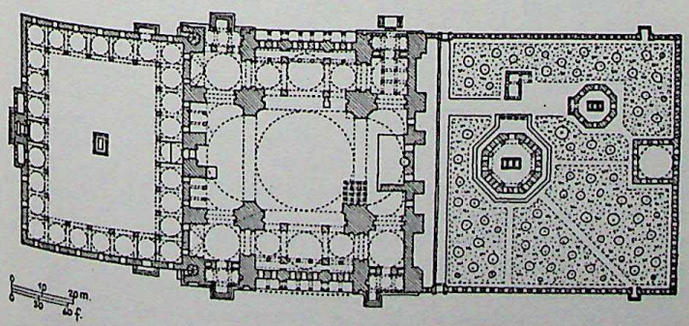


Cairo, mosque plans. (*a*) al-Ẓāhir Baybars; (*b*) Ibn-Ṭūlūn.

enemy attack. The ribats served as military encampments at strategic points and as guard posts against invasion. Each had powerful walls, cells for living quarters, special areas for storing weapons and provisions, a prayer room, and a watchtower. They were especially numerous in Transoxiana but were also to be found along the coasts of Palestine and North Africa. Examples have been preserved in Monastir (late 8th cent.) and in Susa (821), both in Tunisia (see AFRICA, NORTH).

The inhabitants of such institutions were volunteers who withdrew to the ribat for shorter or longer periods under ascetic discipline, engaging in pious recitation and guard duty. The Almoravides, who conquered North Africa and Spain in the 11th century, originated from such ribats in the Sahara and along the Senegal, while the Moroccan capital, Rabat, derives its name from a similar fortress. A change occurred in Persia in the 12th century through the institution of the khankahs (*khānaqāh*s), monasteries of the Sufis, a sect animated by mystical piety and without military aims. Khankahs, often of considerable size, were also built in Egypt during the Mameluke period (see MAMELUKE ART), sometimes in association with mosques, schools, or funerary sites. The *zawiya*s which developed in North Africa were, by contrast, of modest size and without architectural distinction. These foundations were composed of ascetics either led by a sheik or congregated around the grave of a worthy personage.

Mausoleums erected over the graves of holy persons were provided with a mihrab and *qibla* and were often endowed by the deceased with a mosque or madrasah, thus becoming objects of popular worship. Their design, however, hardly



Istanbul, plan of the Mosque of Sultan Sulaymān.

differed from funerary monuments of a purely secular character, and they can scarcely be discussed as a separate category.

There are no large funerary monuments from early Islamic times, since explicit pronouncements of the Prophet prescribed simple burial. This injunction was generally adhered to in the Islamic world, and the place of burial was marked only by a stele at the head and foot of the grave. Moslem rulers do not seem to have been inclined to commemorate their earthly pilgrimages with imposing monuments.

Turkish potentates, it appears, were the first within ruling circles to abandon traditional restraint, constructing for themselves funerary towers of polygonal or circular plan, with conical terminations and a strongly marked surface grooving, making them reminiscent of the corded conical tents of Central Asian nomads. Such structures were built in eastern Persia from pre-Seljuk times until the 13th century, with some variety in scale and design. Impressive domed mausoleums developed concurrently with these funerary towers and emerged into the foreground at that time. This form was adopted by the Mongols and can be seen in an outstanding example erected for Sultan Öljeitü (Uljeitu; VII, PL. 400). Another type of monument is exemplified by the famous mausoleum constructed for Tamerlane in Samarkand in the funeral precinct reserved for his family.

In Egypt, only a few important mausoleums are preserved from the period of the Fatimids. Under the Mamelukes, however, this type of monument underwent a rapid evolution, and many ruins are still partially visible in the largely preserved necropolis on the outskirts of Cairo (PL. 162). Domed mausoleums were here often connected with mosques, monasteries, schools, and fountains (IX, PLS. 270, 271). The combined funeral monument and madrasah of Sultan Ḥasan (IX, PL. 270), located within the capital proper, has a number of unique architectural features and a complex of cells intended as student residences. Another outstanding mausoleum is that of Sultan Qalā'ūn, with a dome resting on horseshoe arches carried by piers and columns. The Osmanlis contributed a number of additional variations to this basic type.

Under the Safavids (ca. 1502–1736) a large, richly decorated sepulchral mosque was begun in the 16th century in Ardebil, Persia, over the grave of the founder of the dynasty. It was greatly favored as a pilgrimage site and must be counted as one of the most significant examples of sacred architecture of the period. In India, an original type of fortified funerary monument was developed in the 14th century. Under the Moghul emperors, mausoleums were constructed along less formidable lines, as pillared pavilions with arcades of pointed arches, deep niches, and small kiosks, the whole usually set in the midst of a body of water or in a park (PLS. 166, 169; VII, PL. 498; X, PL. 111). The most famous example of this type, the Tāj Mahal near Agra (VII, PL. 498), is situated at the end of a large, landscaped area. It is covered with light-colored marble, surrounded by smaller structures in red sandstone, and framed by rectangular towers in an outstandingly harmonious arrangement.

In Western Turkistan the early walled precinct (*muṣalla*), from which the concept of the mosque sprang, was once more taken up under the Mongols and elaborated into a monumental form.

An important institution for the care and preservation of Islamic religious buildings was the *waqf*, consisting primarily of pious donations of property such as lands, industrial goods, baths, and shops. These donations were operated commercially in order to raise funds for the upkeep of mosques, madrasahs, hospitals, fountains, bridges, and other public buildings and in order to maintain a relief fund for emergencies. This institution was maintained over a number of centuries, and inscriptions recording the names of benefactors were sometimes placed within buildings favored by a donation.

SECULAR ARCHITECTURE. The Prophet, for his own living arrangements, had contented himself with a large yard enclosed by a mud wall, provided on one side with a gallery (*ẓulla*) covered with palms to shelter his guests from the sun. A number of small rooms were constructed on another side of the wall for his wives. The residences of the first caliphs were in all likelihood not much more elaborate.

It was only with the transfer of the caliphate to Damascus under the Ommiads that more expansive residences were con-

Elevations of minarets. (*a*) Cairo, Mosque of al-Ḥākim, west minaret; (*b*) Nayin, Iran, Masjid-i-Jāmi'; (*c*) Marrakech, Mosque of the Kutubiya; (*d*) Isfahan, Chaḥār Bāgh Mosque.

structed for the ruling class, although nothing specific is known concerning the seat of government in the capital. The majority of the Ommiad rulers were in any case ill at ease in the unaccustomed surroundings of the crowded city, preferring to construct their villas or palaces in the desert of Transjordan or Syria. The ruins of a number of such structures have been preserved. Some of them appear to have been modeled on the Roman forts along the limes, consisting of a wall reinforced by towers, with a single entrance leading into a large courtyard surrounded by reception rooms and living quarters often two stories high. These structures served either as hunting and bathing lodges (*bādiya*) or as permanent residences similar to the fortified palaces of the Lakhmids at Hira. The best-known of the latter type is the palace at Mshattā, which already shows the tripartite division that later became canonical, consisting of a complex of guardhouses, storerooms, and prayer hall; a court of honor and basilican hall with a triconch throne room; and the private apartments of the caliph (FIG. 345).

The next step in the development is exemplified in the palaces of Samarra, which was constructed as a capital for the Abbassides in 835. Through excavations, not only the palace of the caliphs but also a number of other castles and many private houses have been brought to light or traced in ground plan. In the best-preserved palace, Balkuwāra, the tripartite division was again carried out (PL. 151; FIG. 346). In Baghdad proper, nothing has been preserved, but it is known that the palace of al-Manṣūr was closely connected with the main mosque. The palace of the caliph likewise adjoined the main mosque in Fostat, the predecessor of Cairo, and in Cordova, where a few massive remains of the wall of the Alcazar are still visible.

The palaces of the Fatimids are known only through inconclusive descriptions in literary sources. In Mahdia there existed a "castle with golden windows," in Cairo an eastern palace with nine portals and a façade 1,125 ft. in length, as well as a smaller western palace with two wings cradling an open square. On the other hand, excavations have brought to light a number of structures in the capital of the Hammadids, who ruled certain cities in Algeria. The site of Qal'a Beni Hammād in western Algeria has yielded remains of a "sea palace" (al-Bahr) with a huge pool and a large throne room, as well as a "lighthouse palace" (al-Manār), with an imposing domed hall. In Sicily, there are two relatively well-preserved pavilions from the Norman period, the Cuba (1180) and the Zisa, both in Palermo.

At the end of the 10th century, after the collapse of the caliphate, a large castle was built in Baghdad by the sultan of the Buyids; it is known only through a description, which mentions an inner courtyard surrounded by porticoes with domes, a large audience hall, a small judicial hall, and a park extending to the Tigris. This palace was probably used also by the Seljuks, but as little remains of it as of the other residences of this dynasty and its atabegs in other capitals. Later, the royal encampments of the Mongols undoubtedly were more or less strongly tinged with East Asian influences; at the same time the rigid hierarchical order prevailing among the Mongols was maintained. No precise information is available, and accounts of Tamerlane's palace in Samarkand given by European travelers do not permit drawing of definite conclusions.

Aside from a few remains in Seville, secular architecture in Moorish Spain is represented chiefly by the Alhambra, which is relatively well preserved. The division of the complex into three distinct parts, each constructed around a courtyard, is still clearly visible. The first part (*mashwar*), with guard-rooms, a hall for public receptions, rooms for the judiciary, and a small oratory, is followed by the official area (divan),

Mshattā, plan of the castle.

with offices for the court officials arranged around a court of honor dominated by a large water basin and connected with a majestic audience hall built into a great tower. The third section of the complex (*ḥarīm*) is built around a large fountain borne by lions and comprises the private quarters of the sultan, with various rooms and halls, with baths, inner gardens, apartments for the princes, and a small prayer room. Connected to this section was the royal funeral precinct (*raudha*) and a passage, no longer recognizable, leading to the mosque. The same disposition, allowing for differences imposed by characteristics of the specific site, was followed in Moroccan and Tunisian palaces, as well as in the Alcazar of Seville (PL. 113; X, PL. 168), which was constructed by Moorish architects in the 14th century for King Pedro el Cruel of Castille.

The palaces of Persia have disappeared almost without trace as have those constructed by the Safavids in Tabriz and Qazvin. By contrast, the complex in Isfahan is still largely preserved. Characteristically, it is a loose arrangement of impressive pavilions and kiosks of varying sizes, rather than one large, unified structure. The palace contains water basins, canals, and lanes framed by rows of trees laid out within a carefully planned park. The palatial precinct was accessible from a large square through a high gate in the middle of one side of the square. Among the pavilions, the slender proportion of the supports in the so-called "Hall of Forty Columns" is reminiscent of similar wooden kiosks which existed in Turkistan.

The Topkapı Saray Palace in Istanbul, which served as the residence of the sultans until the 19th century, was constructed on the site of the Old Acropolis of Byzantium, surrounded on three sides by the sea. The disposition of this structure does not follow a uniform plan; the parts were apparently constructed at different times according to necessity and on the basis of different designs. The oldest and most interesting of these parts, built after 1472, is the well-preserved Chīnīli Kōshk, with a central dome, liwans laid out according to a cruciform plan, columned anterooms, and a several-storied rear façade. By and large, in the construction of additions to existing palaces Moslem rulers proceeded without much respect for older structures, often razing entire blocks of such constructions or building new parts totally out of character with older parts. The palaces of the Moghul period in India, parts of which are still well preserved, were very large and coherently planned and were regularly situated on a height overlooking the town, as in Gwalior, Delhi, Lahore, Amber, and Agra (PL. 165). In their execution, they show a happy blend of Persian and Hindu elements.

The private houses of city dwellers varied according to region and climate as well as established traditions. In Iraq, the basement level, equipped with an air shaft for cooling, was used as a guest room (serdab). A T-shaped hall composed of small rooms in the corners and a colonnade leading to the courtyard (*tarma*) was used as a reception room. Such rooms can be found in 9th-century Samarra, and in Syria took the form of the widely distributed *qā'a*. In this arrangement, three liwans, also laid out in the form of a "T," are disposed around a somewhat recessed central space, which was normally equipped with a fountain. This plan was known also in Egypt (IX, PLS. 272, 274) and Turkey.

Another type of private house, which was developed in Turkey and popularized abroad after the Turkish conquest, was a wooden construction with a projecting upper floor and latticed bays. In North Africa and Spain, house construction adhered basically to the Hellenistic tradition of flat roofs with terraces and colonnaded arcades framing inner yards. In Persia, by contrast, vaulting was in common use. Within certain regions, such as Khorasan, the houses of entire villages were roofed with small domes, evidently as a means of protection against both the heat of summer and the winter snows. Indian residential architecture of the Islamic period was greatly influenced by the Hindu tradition.

Among the most important types of public buildings in the Islamic world were the often enormous guest houses or caravansaries (khan or han; in the West, fonduk; PL. 161; I, PL. 13) constructed along the main routes. In the Seljuk period, these were constructed at every isolated relay station and were often fortified outposts for the protection of travelers. The Mongols, Safavids, and Osmanlis also erected imposing struc-

tures of this type. In Iran, their disposition had much in common with the plan of the madrasah, consisting of liwan halls laid out in a cruciform pattern and usually separated by two-storied passages, of which the lower ones were used as stables and warehouses and the upper to shelter guests. About sixty such caravan relay outposts from the 13th and 14th centuries have survived in Anatolia. These were all vaulted and usually consisted of a number of halls, with a small, often domed, inner courtyard and sometimes a special oratory.

In the cities, stores and warehouses were constructed according to the same architectural principles and were mostly concentrated in the bazaar quarter (*sūq*), which constituted a distinct section closed off at night. The bazaar quarter itself was composed of a number of square halls, each of which was covered by a small dome or by a simple protective awning. Remains of such architectural complexes from the Middle Ages are rare, although parts of one are still preserved in Tunis. The 17th-century bazaars of Isfahan and Kashan are architectonically and in plan among the most carefully worked out and impressive. A number of other bazaar complexes in the Orient have been more or less modernized over the centuries.

Hospitals (*māristāns*) frequently were established as pious private foundations. The most famous of these was the institution constructed by ʿAḍud ad-Daula in Baghdad in the year 979. It had various clinics and stood until the 13th century. The hospital built by Sultan Qalā'ūn in 1284–85 adjoining his mosque could still be appreciated in its original design during the 16th century.

A number of bathing establishments (hammam) in Andalusia go back to the 10th century. These were conceived on a small scale, but still following the over-all design of the Roman thermae, with an *apodyterium*, *tepidarium*, and *caldarium*. The form was further developed by the Turks, as shown by the large baths of the 14th–16th century in Kaplica near Brusa (now Bursa), which are still in existence today.

The bridge designs of the Arabs also follow Roman tradition and for a long period of time they were content to restore and consolidate antique constructions. A truly new and monumental style only appeared during the rule of Shah ʿAbbās I (early 17th cent.), who included in his comprehensive plan for the city of Isfahan a number of two-storied bridges with a bold series of niches and pavilions at each end and along the span itself (PL. 160).

ARCHITECTURE AND DECORATION. Despite its originality and rich variety, Islamic architecture for the most part manifested little concern for the solution of genuine structural problems. This lack of interest in such problems may be explained primarily by the preference in the Islamic world for spatial entities of a decidedly horizontal or ground-hugging character. Bold thrusts upward into space and attempts to exploit the possibilities of verticality were nowhere seriously undertaken, and only isolated experiments can be cited.

The prayer room of the early mosque, with its forest of columns, was of limited size and together with an arcaded courtyard formed one distinct entity. Enlargements were carried out through construction of additional bays in the length or width, depending on the availability and character of the land, and without apparent concern for preserving the original axis of the structure. In exceptional cases the courtyard also might be shortened. In order to alleviate the oppressive feeling within these low buildings, the arches supporting the roof were elevated by means of impost blocks. In Cordova, a solution was found in the erection of a second story of arches mounted on consoles (PL. 148). The horizontal tendency thus was slightly modified, as it was also by the introduction of the pointed arch and brick construction in the 9th century; the flat ceiling was retained and the implications of the pointed arch, so fully realized in cathedrals of the West, were not exploited in the Islamic world.

Even where flat roofing was precluded by climatic conditions, single, all-enclosing gabled roofs were avoided and each nave bay was separately spanned. Similarly, monumental portals were avoided in favor of numerous small doors opening onto the courtyard and in the sides of the structure in a regular rhythm, thus increasing interior illumination.

The courtyards within Persian liwan mosques, based on the design of the madrasah, were dominated by large portal niches, one on each of the four sides. These were linked by two stories of consecutive niches, rhythmically arranged and bearing ceramic decoration, thus becoming a primarily decorative element. Despite the rich variety of design which characterizes Islamic dome construction, it is difficult to speak of a pronounced tendency toward monumental vertical effects. Domed mausoleums, funerary towers, and turbehs are characterized by massive and clearly defined forms and produce an impression of earth-bound stability rather than of dynamic elevation. The effect of the bold, pointed dome surmounting the early-14th-century structure of the Ilkhan ruler Öljeitü (Uljeitu) in Sulṭāniya is mitigated by the lower story's rows of niches interrupted by piers supporting towers (VII, PL. 400). An impression of horizontality is also clearly discernible in the great mosques of India. The effect of unity is here largely dissipated by the vast expanse of masonry, by the repetition of the onion-shaped domes, and by the isolation of the entrances. Monumentality is expressed solely by horizontal expansion.

An entirely different effect, however, is achieved in the mighty domed mosques of Istanbul. The construction of the dome on pendentives, the opening of the wall surfaces by rows of windows, and the grooving of the load-bearing piers yield an impression of lightness and airiness which belies the complicated problem of statics resolved in such buildings. Efforts such as these, which can be traced to the inspiration of St. Sophia, went even further in scope, yet real attempts to develop the central mass as an element of towering height were avoided. Moslem architects were more concerned with the decoration of the exterior by rows of small domes and with the creation of contrasts between the slim minarets and the massive volume of the main central dome.

Tower construction was characterized by considerable restraint, and the silhouette of the typical old Islamic city was little affected by such vertical structures. In the West, where towers were apt to be massive rather than tall, they remained a subordinate element in the cityscape. In Cairo, despite numerous types of variants introduced by the Mamelukes, the construction of a large tower to dominate the entire city was never attempted. In Iran, towers had a purely decorative effect, since they were of limited height and were usually built in pairs to flank liwans. Even the tall, needlelike minarets of the mosques of the Osmanlis did not extend substantially beyond the height of the dome.

The canon of horizontality was especially apparent in residential buildings and palaces. Enlargement of existing premises was effected by means of outward expansion, never upward. Large courtyards with water basins played an important role, and buildings were sometimes erected with symmetrically disposed terraces and parks, which were always laid out as flat surfaces. It can be shown that where little space was available, as in Fostat, tall buildings were erected. Such was also the case in certain settlements in Arabia for reasons of a traditional character. These examples, however, are the exceptions that prove the rule.

Concern with structural problems in Islamic architecture is much less evident than interest in decorative effects. The tectonic function of each architectural element was carefully considered, and height, width, and mass were accurately calculated according to a specific canon of proportion; the structural purpose of single elements was deemphasized by a loosening and breaking up of forms and by ornamentation. Round masonry piers were inscribed with deep grooves or decorated with stucco or faïence incrustation, and the weight-bearing function of columns was seemingly denied by the use of impossibly slender columns grouped in clusters. In a number of instances, as, for example, in the Alhambra, the illusion of perspective was created within a relatively shallow space by a coulisselike graduation of passageways.

The encroachment of the decoration upon the structure can be followed with special clarity in the development of the

UP State Museum, Lucknow

form of the arch. As early as the 10th century in Cordova, the horseshoe arch began evolving toward the trefoil and zigzag arch (PL. 148; X, PL. 163). The pointed arch was also given a zigzag contour, and Spanish architects of the 11th century in Saragossa made use of stucco, which could be easily modeled to cover the surfaces of arches with a profusion of inorganic ornamental details. A more sober tendency followed, but the contour of the arch was still occasionally given a saw-tooth form. In Granada, a steplike arch of a purely decorative character ultimately developed.

An important aspect of architectural decoration in Islamic art was the use of honeycomb or "stalactite" work. In this technique, developed before the pendentive, the transition between the dome and the square or many-sided supporting structure was made by means of small corner niches. These were eventually decorated with a network of small cells hiding the surface of the transition area under a variegated pattern.

The precise geographical origin of this decorative system, called *muqarna* work, has as yet not been established, although in the 12th century it was in use from Morocco to Turkistan. It was used not only in domes but in all types of vaulting, including portals and prayer niches, as well as in friezes carved in very high relief. In certain buildings it was carried out with great refinement. Stalactite capitals made their appearance in the Alhambra, while the star-shaped vaults of some rooms in the *ḥarīm* complex, covered with minute cellwork, carry this motif to its ultimate point of development (PL. 149). In the 16th-century private Audience Hall (Dīwān-i Khās) of the Indian emperor Akbar in Fatehpur Sikri, the *muqarna* work had a distinctly static character. A central pillar, which branches out into a richly decorated stalactite capital, bears the throne platform; from this platform radiate four diagonally placed "bridges" which lead to a surrounding gallery. The *muqarna* technique was not limited solely to stone or wood but was also carried out in brick and faïence.

Ornamental and figural reliefs in stucco, in all likelihood originally painted, were employed in the decoration of certain desert castles, following Sassanian tradition. Glass and stone mosaic work (see MOSAICS), which was used in floor or wall decoration, was, on the other hand, produced almost exclusively by Byzantine craftsmen (PL. 145). Wall paintings of the 9th century, inspired by Byzantine or Sassanian art, with certain Chinese influences, have been found in Samarra; later examples are less frequent. Strongly coloristic effects were especially favored from the 13th to the 15th century, as is indicated by the popularity of faïence mosaic (see CERAMICS). In Spain, this technique, which was chiefly confined to decoration of the lower parts of the walls, made use of patterns of great variety, composed solely of geometric forms. In Iran, a wider range of color and more complicated curvilinear forms were employed. This art was practiced with great skill by the Persians and later, under Persian influence, by masters from Anatolia and Turkistan.

Under the Timurids and the Safavids, the use of ceramic mosaics in architectural decoration reached an unprecedented level of perfection. Graceful arabesques, colorful floral forms, imitation medallions and cartouches, and friezes of ornate and exquisite inscriptions were combined into tapestrylike patterns of glowing color (see CALLIGRAPHY AND EPIGRAPHY), with a predominance of cobalt blue. Motifs found in such work were undoubtedly transmitted largely through manuscript illumination but were used also with uncommon virtuosity in pottery decoration. Flat surfaces as well as curved vaults, liwans, domes, and even minarets were often covered with an uninterrupted mantle of faïence mosaic, completely hiding the masonry of both exterior and interior. The observer is blinded by the enormous richness of such decoration and is no longer aware of the underlying structure.

In Turkistan during the 15th century, and in Persia from the end of the 16th, the slow and difficult technique of mosaic work was replaced by a simpler method using mainly square tiles. The drawing style and range of color were retained, so that the change from the earlier and more complicated technique is not always immediately apparent. In the 17th century, certain pavilions within the palace complex of Isfahan were decorated with figural compositions consisting of small individually designed tiles covering the surfaces of entire walls.

The same system was used by the Turks, who employed huge quantities of faïence tiles made in Îznik (anc. Nicaea) in decorating the palaces and mosques of Istanbul and eventually of the whole Ottoman empire. Entire wall surfaces were covered with this type of ceramic decoration, using standard arabesque and curved band motifs, and especially floral patterns, which became, together with a particular shade of red, almost a trademark of the Ottoman period (III, PL. 144). Egypt and Syria imported the technique of ceramic incrustation only at a late date; in the Mameluke period, intarsia work in marble was the favored method of architectural decoration, used with especially successful results in the ornamentation of prayer niches in the mosques.

An important characteristic of Oriental interior decoration was the virtual absence of large furniture. The principal aim was to give the wall surface a pleasing appearance. Under the Abbassides, as can still be seen in a number of houses in Samarra, the surface of the wall above an uninterrupted stucco dado was broken up into niches of varying shapes used for the storage of small objects and books. In later times, such niches were given a distinctly playful effect by carving into them replicas of bottles, vases, containers, and other household objects. Eventually it became customary in Persia, as well as in India, to cover the wall with purely decorative niches. At times these were even illusionistically extended onto the ceiling by means of painting. Such a procedure is typical of an esthetic whose aim it was to avoid an empty, smooth surface at all costs. A 17th-century storeroom with niches designed to hold Chinese porcelain is still preserved in the Porcelain Room in Ardebil (PL. 160).

In Egypt, walls were covered with wood paneling into which were cut small niches alternating with doors opening onto closets with shelves. In Syria and Turkey, walls were later designed with closetlike niches, coffered doors, decorative paneling, and an overhanging frieze of stalactite work. A taste for the rich effect of ornamental and figural designs executed in lacquer painting, probably derived from Persia, is also characteristic (PL. 421). On the whole, Spanish and North African practice favored ornamental stucco incrustation above a ceramic dado. In general, then, sharply defined, closed spaces and avoidance of empty surfaces were the rule in Moslem houses.

Since the custom of sitting on the ground prevailed everywhere, the decoration of floors assumed considerable importance. In the West, flagstone was used, while stone mosaic with geometric patterns predominated in Syria and Egypt. Knotted rugs were preferred in Persia and Turkey (PL. 158). The patterns most frequently found have either an over-all repetition of the same motif or one central element surrounded by an over-all background design, as in the Persian "medallion" type. There were either richly coffered, flat ceilings, or round or polygonal domes, with drums pierced for greater illumination, supported by corner consoles of stucco or wood.

ORNAMENT. Islamic art, like other artistic movements, can be understood only in relation to its past. The artistic heritage of the Arabic people was modest, and would not have been sufficient to permit the development of a distinctive decorative style. The Islamic style evolved principally from the artistic resources of older cultures that Islam stimulated to new efflorescence, in which Byzantine, Sassanian, and Coptic decorative practices were adapted to new requirements. The original connotation of these styles and the fact that they had been practiced by peoples regarded as infidels and foreigners were of little concern to the Moslem conquerors. Instead, attention was chiefly devoted to transforming them into an abstract language capable of rhythmical repetition and suitable to the Islamic preference for completely filled surfaces. Artisans had to adapt their style to the taste of their new patrons. The following generation became thoroughly accustomed to the demands of the new clientele, and its ties to the art of the past gradually weakened.

UP State Museum, Lucknow

A new and important element which exerted a powerful influence on decorative forms was the Arabic script. It lent itself easily to the formation of ever-new variations. The angular and massive character of Kufic script, as well as the round and readily changeable forms of Naskhi writing, were used both in the elaboration of monumental epigraphy (III, PL. 7) and in the decoration of small household objects (I, PL. 4). The texts used in the decorative scheme of religious as well as secular buildings were for the most part taken from the Koran. In addition, words of acclamation and praise for the ruling prince and wishes for a blissful hereafter for the architect or the owner can also be found, often accompanied by dates. Secular poetry appears with relative infrequence in decorative inscriptions which, even in Persia and Turkey, were normally composed in Arabic (see CALLIGRAPHY AND EPIGRAPHY).

The execution of calligraphic flourishes called for considerable feats of artistry, and in this domain Islamic artisans were unsurpassed. At the height of their art, large surfaces were covered with pious inscriptions written out in a geometricized Kufic script, which was fully legible. Such a playful use of calligraphic forms was especially popular in Persia, where it was used also in book illumination.

Geometric ornament of a very simple character had already been used in the folk art of the Arabs, and certain motifs can be traced back to pre-Islamic times, as shown by extant examples of ceramic ware and textiles. The zigzag band with inserted roundels which dominates the façade of the palace at Mshattā is surely of Arabic origin (X, PL. 381). The Arabs possessed a talent for mathematics, and their experimentation with the line and circle stimulated their imaginations and led them to create ever-varying designs based purely on abstract principles.

Checkerboard and zigzag patterns, as well as the swastika and the meander, were among the most frequently used design motifs. Patterns created through interlacing bands in star and polygonal configurations were also widely employed at an early date. Such patterns, found even on the earliest preserved bookcovers, were used to best advantage in cofferwork of the Seljuk and Mameluke periods. Other combinations of basic geometric forms were also repeatedly used (PL. 147; V, PL. 251; VII, PL. 402). Interestingly, these forms were given by the artisans such highly descriptive names as sun, almond, lemon, rose, drum, and bottle. Knotted configurations, especially in an isolated context, may have had symbolic connotations that retained a superstitious significance among the people. Five-pointed stars called "Solomon's seal" and the popular swastika motif were, in all likelihood, prized solely for their ornamental value. Medallions and rosettes were common, as were crenelation, astragal motifs, and pearl bands.

The vine tendril was the dominant element among plant motifs, occurring in wave, spiral, and loop variations. In its earliest manifestations, as at Mshattā, this motif appeared in combination with vine leaves and grapes, although the rendering can be readily differentiated from late-antique carvings of the same subject because of the denser quality of the Islamic work. In later examples, stylization was carried to the point of almost total abstaction, so that plant forms lost their natural character: for example, grapes appeared as pyramids of drops.

The adaptation of the vine tendril to the form of the arabesque was a decisive phase in its evolution. Earlier writers had applied the term "arabesque" to a wide variety of Islamic decorative motifs, but Alois Riegl has rightly restricted its scope to the forked-leaf vine tendril (*Gabelblattranke*) and its various derivations. Although the late-antique wavy tendril must be mentioned as a prototype, the development of the arabesque took place in early Islamic times, and it may therefore be designated a specifically Arabic contribution to Islamic decoration, even though it was subsequently adopted in all other Moslem countries.

The arbitrarily stylized plant forms of the arabesque were particularly adaptable, and hundreds of variants of the basic pattern have been traced. The leaf might appear in a compact and somewhat circumscribed form or be given a more elaborate treatment. Either smooth or rough, veined or pierced, pointed, rounded, or rolled, it was never shown in isolation but always as an organic part of the plant form. The stem was wavy, spiral, or interlaced, penetrating through the leaves, and branching, always in a continual pattern. The doubling of the leaves made possible the constitution of palmette or chalicelike forms which contributed an effective rhythmical articulation to the total design. The arabesque lent itself admirably to every conceivable artistic endeavor. It was used in friezes, borders, as an over-all motif on large surfaces, and especially as a background in panels with decorative inscriptions. Enjoying its greatest popularity in western Islam, the arabesque was introduced into European art toward the end of the 15th century, finding its way into the 16th-century pattern books of Francesco Pellegrino, Peter Flötner, Hans Holbein, and others.

The form of the acanthus, especially in the sculptured capitals made in Spain and Iraq during the 9th and 10th centuries, was adapted to Islamic style. The leaves were pierced and individual stems were treated as isolated elements, with little of the organic character of the motif remaining beyond the basic leaf shapes. Numerous variations of the palmette, such as the chalice-shaped palmette, the full-blossom palmette, and the split palmette were also introduced. The most significant of these variations was the lotus palmette, which originated in eastern Asia and was especially favored in Persia and in Mameluke Egypt. The rosette motif, known in the ancient Orient, also enjoyed widespread favor. In its Islamic form it had no symbolic connotation and was usually so stylized that it can not be traced to any precise botanical type. The treatment of plant forms in a relatively naturalistic style was first introduced on a large scale under the Ottomans, whose ceramic ware and textile designs show tulips, carnations, hyacinths, and roses, as well as vines and artichokes, often in arbitrarily combined and stylized forms which are, nevertheless, clearly differentiated.

The motif of the cornucopia was radically transformed at an early date, and while it undoubtedly derived from antique decoration, its original meaning disappeared entirely in the process of conversion to Islamic art. The characteristically antique festoon is replaced in Islamic art by a regular succession of arabesques and other plant motifs. The wreath appears early in Islamic art, although the specific identity of the plant forms cannot always be determined with certainty. The majority of examples appear to show laurel leaves.

The tendency in Islamic art to adopt symbolic geometric and plant forms of other cultures and to transform them into purely decorative motifs has already been mentioned. The same tendency is evident in the adaptation of the so-called "cloud band," which was taken from the art of eastern Asia. It was brought westward in the course of the Mongol invasions in the form of ball-shaped clouds and in Persia was transformed into an abstract pattern. Having undergone a number of formal changes, the motif was widely used in the arts of Persia, India, and Turkey.

The motif of the isolated animal, treated as an element dominating an entire composition, occurs exclusively in Iranian art and represents a reversion to an earlier Sassanian practice. The use of this motif may be traced in Iranian ceramic ware through the 14th century. Among the various animal forms frequently encountered in Islamic decorative art, the following may be cited: processions of four-footed animals of various types forming a continuous frieze across the surface of a vessel, as were already known in ancient Near Eastern art; birds fluttering, running, or flying, presented in series, frequently fused in border designs; fish in large numbers within a vessel or arranged in rows as a border; animal combats, such as attacks by lions, tigers, panthers, and eagles upon stags, hares, and gazelles; hunting scenes of various types, showing animals pursued by hunters or beaters, mounted or on foot; signs of the zodiac.

Lions, tigers, panthers, lynxes, and wolves were the most frequently represented beasts of prey; others included elephants (I, PL. 7), camels, horses, donkeys, wild asses, bulls, deer, rams, goats, gazelles, and hares. Among the birds, eagles, falcons, pelicans, peacocks in various positions, ducks, doves, swallows, and quail were favored. Various kinds of snakes

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

were also shown. Such fantastic animals as the griffin (V, PL. 254) and the dragon, in part retaining their peculiar East Asian design, the female sphinx, Pegasus, and the hippocampus, all derived partly from antiquity and partly from Sassanian art, were also employed for decorative purposes. The two-headed eagle and other heraldic combinations of confronted animals such as birds, lions, panthers, or gazelles were particularly favored. They could be shown either facing each other or turning away with heads averted.

The theme of animal combat was of ancient Iranian origin and had retained its symbolic connotation in Sassanian art. In Islamic art, however, it was used for purely decorative purposes and accordingly was not restricted to the conventional scene of the bull attacked by the lion, or the gazelle attacked by the eagle, but included other arbitrary combinations as well. The signs of the zodiac had a cosmic and astrological significance, especially when combined with representations of the constellations, as was often the case in metalwork. Such designs were also used in a purely decorative way, as in ceramic ware. Their fixed number of 12 influenced the design of twelve-sided vessels such as bowls and basins and of twelve-branched chandeliers. Cosmic symbolism connected with the number of the planets may also have been influential in the design of six-sided surfaces, in the center of which was represented the sun.

Animals were often represented with considerable liveliness and a suggestion of natural movement, but they were always stylized in accordance with an overriding decorative purpose. At times a point of near-abstraction was reached, and heads, masks, or protomas were combined with foliate tendrils to create a type of grotesque that was for a time one of the most characteristic manifestations of Islamic art.

When the human figure appears in Islamic decoration, it is never a portrait of a specific individual, and the small scenes that appear on many decorative friezes and medallions were never meant to have significance as historical episodes. A popular theme was that of the enthroned ruler, often with a raised cup, flanked by attendants and sometimes in the company of musicians with various instruments, acrobats, and dancers. Hunting scenes showing the ruler mounted on a horse, a falcon on his wrist, enjoyed great popularity, as did scenes of battle, of tournaments, and of polo games. Despite their obvious relationship to court life, such representations appear entirely divorced from reality, even when dedicatory inscriptions show that they were intended as gifts for a specific prince.

The number and variety of iconographic themes treated in manuscript illumination were considerably greater. Illumination constitutes a separate chapter in Islamic art (PLS. 143, 167; see MINIATURES AND ILLUMINATION), though compositions derived from such art — the meeting of Khusrau and Shīrīn, Majnūn in the desert (I, PL. 14), Bahrām V at the hunt, and similar episodes from popular epics — sometimes entered the repertory of the handicraft worker, especially in Persia.

In representations of the human figure, it is interesting to note that contemporary costumes were shown, regardless of the nature of the subject (PLS. 153, 154; I, PL. 9). Movement of the body was often rendered expressively, but there was little interest in characterization of the face. Figures were generally superimposed upon a background decorated with vine tendrils or branches, and a circular nimbus often set the heads off from the background, though no religious connotation was intended. The figure frequently was highly decorated so that it might hold its own against the almost overpowering arabesque background. Among the representations of supernatural beings, genii, shown as winged angels, were very common. Demonic figures such as the *div* were represented as rather bizarre, though not always evil, human creatures and were generally restricted to miniature painting. Planets were usually represented by half-length personifications with their characteristic attributes.

Representations of Christian subjects were by no means rare, especially in metalwork. They reveal nothing about the faith of the artist, indicating merely that the object on which they were shown was intended for a Christian congregation or household. Moslem craftsmen might execute such scenes according to a foreign model.

ORGANIZATION OF LABOR. In the construction of cities and of individual buildings, religious or secular, rapid completion was the most important consideration. Rulers laid great stress upon the execution of their plans in the shortest possible time, and they spared neither money, nor materials, nor labor in achieving this end. The painstaking travail of entire generations in the building of a single structure was unknown to Islam, and a new construction was sometimes begun where only enlargement of an existing building was necessary.

The Ommiad caliphs, who were almost entirely dependent on foreign labor for their building activity, relied upon a system by which they were able to avail themselves of construction workers and materials from every part of their domain and thus to carry out their plans in a relatively short time. Provincial governors obviously found it difficult to deny their obligations to the caliph; in certain cases, however, they attempted to avoid conscription of workers by giving increasingly higher cash payments to the caliph. Workers recruited for such service occupied a position on the social scale somewhat higher than that of slaves, but they were permitted little freedom. Sources indicate that in the course of constructing castles in the desert many laborers died of thirst or starvation and that rebellion occasionally broke out.

The participation of a labor force recruited from many countries did not create (as has been erroneously assumed) discrepancies of style in the finished construction. The work was always directed by an architect in a position to impose his ideas and established plan. Even when the task of decorating a newly erected structure fell upon a heterogeneous group of artisans composed, for example, of Syrian sculptors, Greek mosaic craftsmen, stuccoworkers from Iraq, and Coptic wood carvers, individual notions of style had to be set aside in favor of a common purpose.

The system of procurement of laborers used under the Ommiads was still in force under the Abbassides. It is known that for construction of the city of Baghdad, al-Manṣūr conscripted 100,000 workers and designated a commission of astrologers, jurists, and architects, whose names have been preserved. However, because of the use of brick vault construction based on the long-standing Mesopotamian and Iranian tradition, it was necessary to rely largely on local workers. With increasing emphasis on handwork the older system of recruiting gradually lost its purpose, although it continued to be used from time to time. In the 14th century, conscription was employed by Tamerlane to hasten completion of his palace in Samarkand.

It is known that the entire available labor force employed in the production of such objects as pottery and glassware was brought from various places and relocated in Baghdad and Samarra in order to satisfy the needs of a growing population. Although it cannot be conclusively determined whether the Abbasides set up workshops exclusively to meet the demands of the court, it is certain that textile ateliers worked solely to fill the needs of the caliphs. These extended far beyond the personal uses of the ruler, his immediate family, and the personnel of the court, since a custom which long continued to prevail consisted in rewarding outstanding deeds or achievements by means of the khilat, through which the person to be honored was invested by the ruler with special garments. For this purpose, it was necessary to have on hand a large stock of such garments to be distributed at festive receptions or to be presented to foreign courts.

Under the Abbassides, workshops known as *ṭirāz* existed, particularly in Egypt, specializing in the weaving of various types of linen fabric. Some of these, the *ṭirāz-al-khās*, were specifically designated as private workshops in the service of the caliphs, while others, known as the *ṭirāz-al-'āmma*, were supervised by an administrator appointed by the state. After the occupation of the Nile country by the Fatimids, importation of Egyptian stuffs ceased and court ateliers were installed in Baghdad proper and elsewhere. Side by side with the production for the court, other weavers were also active in special areas of Baghdad.

Until well into the 9th century, the artisan class as a whole, and not merely those members who were not of the faith

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

(Jews, Christians, Zoroastrians), occupied a very low social position. An important change in this condition can be attributed to the influence of the Karmathians, a Shiite sect with socialistic tendencies, who were extremely active under the Abbassides. One of the aims of the Karmathians was to ameliorate the lot of the artisans. They created a comprehensive organizational system involving various grades of artisan labor, which resulted in the formation of individual corporations with the hierarchical subdivisions of apprentice, journeyman, and master, as well as the establishment of initiation rites and examinations. The artisans thus were gradually accepted as true citizens. In Egypt, Syria, and North Africa the Fatimids rigidly effected a similar organization of the artisan class into separate corporations, and this system was ultimately adopted in the entire Islamic world. The various industries were also assigned separate places in the bazaars, and specialized activities could be found grouped along the same street or complex of streets, as is still the case in many cities of the Orient.

The *muḥtasib*, the head of the market and trade police (*ḥisba*), played an important role in the regulation of artistic and handicraft production throughout the Middle Ages. Usually a trained jurist, he had his own staff of officials, the size of which varied with that of the community under his jurisdiction. His judicial authority was limited, compared to that of the *qāḍī*, but he was one of the most important officials of the state. He was responsible for the supervision of all activities in the bazaar, including the prevention of fraud in handling food and art materials. Detailed regulations dealt with these and other problems, and the head of each corporation was responsible for their application within his own membership. A number of treatises concerning the administration of the *ḥisba*, dating as early as the 10th century, have been preserved and published in part.

The maintenance of high standards of workmanship and prohibition of the use of cheap or inadequate raw materials were of great importance for artistic production. In addition, the *muḥtasib* enforced the rules limiting use of figural motifs and intervened where the artist seemed to go too far; above all, he guarded against all religious allusions, tendencies toward obscenity, and similar infractions. One instance called for intervention against the manufacture of dolls, which had to be sufficiently naturalistic to be capable of arousing the maternal instinct of little girls without violating the traditional norms directed against excessive naturalism. Scruples of a similar nature motivated the requirement that shadow puppets used in theatrical performances be pierced with many holes, to stress their unreality.

It is known that palace workshops were founded by various rulers for the production of books, rugs, and other objects; the famous glass-enameling workers of Aleppo, for example (PL. 157; VI, PL. 227; see GLASS), were moved to Samarkand by Tamerlane for the purpose of securing a monopoly on their craft. In these surroundings, however, their art deteriorated rapidly. As a rule, artisanry was left undisturbed and was even protected during political unrest or military conflict. The Mongols, for example, despite the wholesale plundering and massacre accompanying their campaigns, deliberately spared the artisan class.

Islamic handicraft workers were active in large numbers in the Christian West. After the reconquest of Spain, Moorish artists were retained by their new Christian masters and even were employed by religious congregations. They were able to adapt themselves to their new tasks, elaborating the important stylistic current known as Mudejar, without, however, abandoning their own religion and artistic traditions. The situation was similar in Sicily under the Normans, who even brought painters and craftsmen to their island from Cairo.

Whether the unmistakable influence of Islamic art upon the Romanesque sculpture of southern Italy may be attributed to the presence of Eastern sculptors and ivory carvers is not yet clear. On the other hand, the existence of an entire workshop of Islamic metalworkers in Venice during the 15th and 16th centuries has been documented. A variety of work in bronze with silver inlay was produced by them for Venetian consumption, notably, lamps, vases, containers, plates, and keys. Indeed, the distinction between *lavoro all'azzimina* and *lavoro alla damaschina* suggests the existence of two workshops, one Persian (*'ajamī*), the other Syrian. A number of individual masters are known through signatures. It has been shown that in Palestine, under the rule of the Frankish Crusaders, a large atelier of Western glassworkers was active, producing enamel work inspired by Syrian products from Aleppo. Venetian enameled and gold glass of the 15th century was also influenced by this Syrian art.

HANDICRAFTS. It is notable that alongside handicraft production there never developed in the Islamic world an independent trend in the monumental arts of painting and sculpture. Creative energy was entirely absorbed by the challenge to produce ever-greater refinement and to create new techniques in the service of the handicrafts. The intensive training of the craftsman and the inheritance of skills through many generations of workers made possible the achievement and maintenance of a high level of quality.

It was considered important that the form of an object be expressive of its function. This aim is seen particularly in certain three-dimensional objects, such as clasps, handles, knobs, and ink stands, which, despite their highly ornate quality, clearly show the function they were intended to perform.

The patronage of the rulers was a decisive element in the prospering of handicrafts, which were expected to supply not only the immediate needs of the court, but also the demand for articles sent to foreign courts and markets to win friends for the caliph and to establish outlets for his merchandise. Important personages in the domain and affluent businessmen were eager to obtain the favor of the ruler by taking an active role in encouraging the sale of local products. The efforts of the artist were stimulated by the personal interest of the patron. The traffic of goods in the bazaars during the Middle Ages, unlike today, consisted less in the sale of ready-made articles than in direct commissions given by prospective buyers.

The master craftsman received detailed instructions from his patron concerning both the form and the choice of material, as well as iconographical and epigraphical considerations. If the object was destined for the ruler, inscriptions recording praise and wishes of good fortune had to appear, while a pious donation to a mosque might be inscribed with a verse from the Koran. Certain Persian faïences carry a personal note in the form of improvised verses addressed to the lady who was the intended recipient of the article.

Production was limited to a degree through restrictions against certain articles of luxury and against the use of figural motifs in religious objects. The most important of these regulations forbade the manufacture of articles in solid gold or silver. Despite these injunctions, ruling princes appear seldom to have been without some objects and even entire services made of the forbidden materials, and ladies were unwilling to do entirely without gold jewelry. In certain Islamic areas only Jewish and Christian artisans were allowed to use these precious metals, and the production of luxury goods was therefore regarded as less objectionable in spite of the injunctions.

Even for those who were eager to maintain an appearance of piety and legality, there existed acceptable ways of eluding these laws by means of various technical refinements. An article might, for example, be made of a nonprecious material, such as bronze, copper, or iron, and be thinly coated with gold or silver, giving it a particularly interesting effect (PLS. 156, 159). This technique, which developed early in Turkistan and in eastern Persia, was brought to its highest perfection in the Mosul school during the 12th and 13th centuries, from which the process spread to Persia, Syria, Egypt, Anatolia, and Venice.

A second means of compensating for the injunction against the use of precious metal was the lusterware technique applied to ceramics (q.v.; V, PL. 253; IX, PL. 275; X, PL. 170). This technique was related to certain procedures known in late antiquity, which were used to impart an almost metallic shimmer to black-glazed ware by means of special additional glazing. The lusterware technique came into its own, however, in

UP State Museum, Lucknow

Islamic ceramic production. Perhaps as early as the end of the 8th century, plates and bowls decorated with relief ornament in a manner similar to chased goldwork were coated with glaze which upon firing gave the entire object a shimmer resembling gold or mother-of-pearl. There were subsequently introduced refinements of the basic technique which involved painting the varnish decoration with a brush on a white glazed surface, which was then lightly fired again, giving a pronounced metallic effect. A more or less golden tint was achieved with undertones of yellow, brown, green, red, or purple, and during the earlier period with subtle variations of these colors side by side. There is reason to believe that lusterware was manufactured in Baghdad beginning about the year 800 and that the technique stood in direct competition with the highly prized porcelain from China. Finds from Samarra show that by the mid-9th century this technique was no longer restricted to vessels but was applied to the manufacture of tiles used for architectural decoration. The new invention attracted immediate attention and spread to the entire Islamic world in a relatively short time. Before the end of the 9th century it had been eagerly adopted by the Fatimids in Egypt, and by the end of the 12th, lusterware was being produced in Persia, where Rayy (Rhages; III, PL. 141) and Kashan were the leading centers of this art. It was also manufactured in Spain (X, PLS. 169, 170), where the most outstanding examples were produced in Malaga during the 14th century. After the Christian reconquest, lusterware continued to be made in Valencia, and in the 15th century it was produced with remarkable success in the Italian cities of Deruta and Gubbio.

One of the interesting aspects of Islamic production was the sustained effort of Persian potters to discover the secret of Chinese porcelain (I, PL. 9). In this they were not successful, but their attempts led to the creation of an exceptionally hard and sometimes translucent pierced ware which closely resembled the much prized East Asian ware.

Along with the application of the luster technique to ceramic products, glassware using the same technique was produced in early Islamic times, especially in the period of the Fatimids, raising the possibility that the technique had been first used on glass. The application of gold and colored enamel to glass vessels in order to give them a more precious appearance became a common practice and was perfected by Islamic craftsmen, especially in Syria, into an important branch of the decorative arts. It was used in drinking vessels such as flasks, cups, and bowls, as well as in the countless hanging lamps of the mosque donated by Mameluke emirs. The most important center of this craft was Aleppo in the 13th and 14th centuries.

Another prohibition was directed against the manufacture of silken garments, and especially those worn by men. In the early Islamic period, this traditional injunction was carefully observed; garments were made only of linen, wool, or cotton and often consisted of a very delicate weave, with silken borders either sewn or woven in. Lengthy discussions took place, and regulations were issued concerning the permissible width of such silk strips, which gradually became ampler and more luxurious (V, PL. 243). Even toward the end of the 12th century Ṣalāḥ ad-Dīn made a special point of wearing only woolen or linen attire. But in Iran, the silk industry begun by the Sassanians was reinforced by every ruling dynasty and never was discontinued. The injunction against luxurious garments was ultimately forgotten, and silk weaves of unparalleled refinement were produced in every province of the Islamic world (I, PL. 7; V, PL. 244; X, PL. 450).

As a matter of historical record, it would seem that neither injunctions against excessive luxury nor prohibitions against the use of certain motifs exerted a negative influence upon handicraft production. On the contrary, these restraints appear to have motivated the artists to do the best possible work within the prescribed limitations. This was more true in the use made of the technical possibilities offered by materials than in the development of new forms. In many instances, the basic forms of given articles were retained from antiquity with only minor alterations made for functional reasons.

The influence of one branch of handicraft upon another can be demonstrated in a number of instances. The imitation of gold objects in ceramic ware has already been cited. There are also faïence vessels which undoubtedly owe their shape to older metalwork. The figural polychrome ornamentation of *mīnā'ī* ceramics from Rayy is an adaptation of elements found in Persian book illumination, which had reached a peak of development in the 12th and 13th centuries. In the 16th and 17th centuries, the schools of painting in Tabriz and Isfahan exerted an influence on local silk and carpet production. This adaptation of motifs drawn from book illumination to the requirements of carpet design was not, however, to lead to altogether satisfying results.

Knotted carpets (PL. 158) occupied a special place among handicrafts, manufacture being carried out by wandering nomads rather than in established workshops of the city. In Turkistan, until the present day, as well as in Persia and Anatolia, knotted work is produced by nomadic groups who have managed to retain many of the stylistic qualities of older work because of their peculiar way of life (see TAPESTRY AND CARPETS).

The high esteem bestowed on Islamic handicraft products can perhaps be gauged by the large number of works of Islamic origin preserved as treasures in Western churches. It can hardly be doubted that without these works it would be almost impossible to form a clear idea of certain techniques which were prevalent in Moslem art. Among the most highly valued objects of Islamic workmanship were the pitchers, flasks, cups, and chess pieces of rock crystal, which were carved in Iraq and Egypt in the 10th–12th century. Polished, golden, and enameled glassware was imported to Europe from the Islamic East before European production began (see GLASS). Ivory caskets and pyxides, either carved or painted, originally intended for the safekeeping of jewelry or spices, were used as reliquaries in the West. These and such objects as oliphants, combs, and chess pieces constitute the sole evidence for Islamic ivory carving from the 9th to the 12th century (PLS. 242, 244; V, PL. 251), for virtually no ivory objects of this period from the Orient proper have been found (see IVORY AND BONE CARVING). Our knowledge of Islamic silk production would likewise be meager in the absence of silks found in Western churches, cloisters, and burial caches.

It was consistent with Islamic attitudes that handicraft objects should have been created by anonymous artists. Signatures are seldom to be found, although large groups of objects, such as incrusted Mosul bronzes of the 13th century (PL. 159) and certain Mameluke ceramics of the 14th are signed for special reasons. In a few instances, a patron may have requested the signature of the artist.

ISRAEL. The state of Israel, established in 1948, comprises an irregularly shaped territory of almost 8,000 sq. mi. Its boundaries correspond only in part to those of historical Palestine, some of the territory of the Holy Land forming part of the bordering countries: Lebanon on the north, Syria on the northeast, Egypt on the southwest, and, especially, Jordan on the east and southeast. Thus the information in the present article bears a close relation to the historical, monumental, and topographical data contained in the articles on these countries, Jordan (q.v.), in particular.

SUMMARY. From prehistoric to modern times: an outline (col. 359). Topographical divisions, with principal cities and sites (col. 363): *Upper Galilee; Lower Galilee; The Jordan Valley; The Phoenician coast; Mount Carmel and the plain of Sharon; The Philistine coastal plain; The Shephala; Jerusalem and environs; The Negev.*

FROM PREHISTORIC TO MODERN TIMES: AN OUTLINE. The monuments and artifacts in this area extend from the Lower Paleolithic period onward. The earliest human remains, dating back half a million years — Palestine man (*Palaeoanthropus palestinensis*) — were discovered in 1960 in the Jordan Valley near the kibbutz Afiqim, south of the Sea of Galilee. In the Mesolithic period (8th–6th millennium B.C.) appeared organized settlements, some in caves and others in round or curvilinear houses; there are the beginnings of magic and cults. In the Neolithic period (6th–5th millennium B.C.), pottery entered on the scene, along with hoe cultivation and irrigation and fertility cults. Metalwork in bronze, figural art of a high order, and the beginnings of true agriculture followed in the Chalcolithic age (4000–3000 B.C.). Organized urban communities with fortifications and storehouses made their appearance in the early Bronze Age (3000–2000 B.C.). With the beginning of the historical period the influence of the great empires of Egypt and Mesopotamia was felt. The country was occupied by Western Semites (Canaanites). The middle Bronze Age (2000–1550 B.C.) represents the apogee of the Canaanites under the sovereignty — until the Hyksos invasion — of the Egyptian Middle Kingdom; this was the age of the Hebrew Patriarchs. In the late Bronze Age (1550–1200 B.C.) Aegean influences asserted themselves, and Egyptian domination, continuing through the 18th and 19th dynasties, was dominant for the last time.

With the Israelite invasion from the east and the Philistine landings on the west, the Canaanites were gradually crushed. In the early Iron Age, or Iron Age I (the age of the Judges and the United Monarchy; 1200–930 B.C.), the Israelites struggled with the Philistines and finally, under David's leadership, defeated them. David's successor, Solomon, made international trade possible for the country by opening up the Red Sea route through the establishment of his seaport Ezion-geber, near Elath (Eilat), at the same time exploiting the copper mines of the Araba; he gave impetus to a development of the visual arts that had great scope, albeit infused with influences from neighboring countries (see JEWISH ART; PHOENICIAN-PUNIC ART; SYRO-PALESTINIAN ART). In Iron Age II (930–586 B.C.) the internal divisions of the Israelite nation led to the split of the United Monarchy into the kingdoms of Israel in the north and Judah in the south; the former ultimately succumbed to the Assyrians and the latter to the Babylonians. The Persians, rising swiftly to power, allowed the Judean exiles to return to their own country. After two centuries of Persian rule (536–332 B.C.), Palestine fell — with the destruction of the Persian Empire by Alexander the Great — first into the hands of the Ptolemaic kings of Egypt (until 198 B.C.), and then of the Seleucid kings of Syria (until 63 B.C.). Under Seleucid rule the process of Hellenization (which had important artistic consequences) advanced rapidly in western Asia, and the effort to Hellenize the Judeans was pressed far beyond the point envisaged even by the Judean Hellenizers, culminating in the occupation of Jerusalem by Antiochus, the desecration of the Temple, and the outright suppression of Judaism. The Hasmoneans, leaders of the rebellion engendered by this attack, after gradually obtaining independence (141 B.C.) extended their power over the entire country; the fall of the Hasmonean dynasty was followed by the establishment of Roman rule (63 B.C.–A.D. 324) by Pompey. The Jews revolted against Rome twice (A.D. 67–73, 132–35) but in the end lost both Jerusalem and the Temple. Both Christianity and normative Judaism had their origins in this period, which was also rich in artistic influences (see IMAGES AND ICONOCLASM). From the Roman period the country passed peacefully into the Byzantine (324–640), during which it was gradually Christianized and numerous churches and monasteries were built. The Arab conquest and domination (640–1099) halted this development, replacing the prevailing Western culture with an Oriental one. The Crusaders (1099–1291) dotted the country with Romanesque churches and castles but were unable to make their rule permanent.

The next rulers of Palestine, the Mamelukes, from whose reign Moslem monuments date, yielded in 1516 to the Ottoman Turks. After a short initial period of building activity under Sulaymān the Magnificent, continuous warfare between the Turks and the local Arab chiefs led to the abandonment and rapid decline of Palestine, briefly interrupted by Napoleon's occupation of the country in 1799. The sultan Maḥmūd II, who took the throne in Constantinople in 1808, was in continual conflict with his pashas over the control of Syria, Palestine, and Egypt, and in 1831 the Turks were expelled by an Egyptian army under Ibrāhīm Pasha; with the aid of an Anglo-French-Russian fleet they recovered possession of Palestine in 1840. The alignment of the Turks against the Allies in World War I led to occupation of Palestine by an English army (1918); by the terms of the peace treaty the British acquired the territory of Palestine as a mandate of the League of Nations (1922). The growth of Jewish settlements, beginning in the early 1900s, aroused the opposition of the Arabs: in 1947 the issue was placed before the United Nations. Termination of the British mandate (1948) and a plan for partition did not serve to avert Arab-Jewish hostilities (1948–49). The actual boundaries of Israel represent the armistice lines laid down in the agreements concluded by the newly declared state with the neighboring countries, February–July 1949.

A considerable number of monuments remain from the Ottoman period, especially in Jerusalem, Safed, Acre (or Akko), and Jaffa. In the 18th century there was an increased diffusion of Europeanized architecture, largely due to the activity of Roman Catholic orders established in the country; churches, monasteries, convents, hospitals, and sanctuaries were built. Jewish immigration began in the second

half of the 19th century, a series of agricultural colonies constituting the first centers. As the tempo of immigration increased in the early years of the 20th century, these colonies multiplied, new towns were created, and the erection of various works of public utility, hospitals, schools, and administrative buildings, was accomplished. The establishment of the state of Israel favored further development of the country: housing projects, residential quarters, and important monuments were created in accordance with modern town-planning criteria in Haifa, Tel Aviv, Jerusalem, and a number of other cities and towns.

TOPOGRAPHICAL DIVISIONS, WITH PRINCIPAL CITIES AND SITES. The following account proceeds in general from north to south; the individual sites are taken up in a west-to-east order.

Upper Galilee. The region of Galilee, usually divided into Upper and Lower, is here taken to include the great valley, or plain, of Esdraelon. In the mountainous terrain of Upper Galilee little remains from pre-Roman times; a study has shown that the region was densely wooded in the Canaanite period and that it was infiltrated and settled toward the end of the period by Israelite tribes. Traces of the primitive houses and pottery of these tribes remain.

Bibliog. Y. Aharoni, The Settlement of the Israelite Tribes in Upper Galilee, Jerusalem, 1957 (in Hebrew).

Kedesh (Kedesh Naphtali; Qedesh). A site important in Egyptian and Biblical tradition, Kedesh exhibits remains of a temple of the 3d century of the current era, and exploratory soundings of the tell have revealed five strata, going back to the early Bronze Age.

Bibliog. Y. Aharoni, Israel Exploration J., III, 4, 1953, p. 263.

Kfar Birim. This site presents the best-preserved of the considerable number of Jewish synagogues in the area, which for the most part belong to the 3d–4th century of our era. These synagogues are characterized by basilican plans combined with architectural details — capitals, columns, lintels, and reliefs — related to those of Syrian architecture of the Roman period and with Orientalizing elements derived from Jewish art of the time of the Second Temple or even earlier. The façade of the Kfar Birim Synagogue is preserved up to the second story (PL. 334).

Bibliog. H. Kohl and C. Watzinger, Antike Synagogen in Galilaea, Leipzig, 1916, pp. 89–102.

Montfort. The Crusader castle of Montfort, which originally belonged to the Mandelée family, was ceded in 1229 to Hermann of Salza, grand master of the Teutonic Knights; it became the headquarters of the order and housed the archives and treasury. In 1271 Montfort capitulated to the Mameluke sultan al-Ẓāhir Baybars, and it has since remained a ruin (partly excavated by Met. Mus., 1926). The surviving features include a court of entry, a vaulted square tower, a chapel and lodgings for the knights, and at the east end, separated from the castle and the adjoining mountain by a deep fosse, the base of a square keep.

Bibliog. B. Dean, The Exploration of a Crusader's Fortress (Montfort) in Palestine, BMMA, 1927, XXII, no. 9, pt. II, pp. 5–46.

Safed. The castle, built in 1140 by Falk of Anjou, was strengthened by the Templars in 1230, the cost of the operation being defrayed with money provided by Benedict, bishop of Marseilles. Falling to al-Ẓāhir Baybars in 1266, the castle became one of the strongholds of Saracen power. Still visible are remains of the Crusader walls, towers, and cisterns. In the course of the 16th century, Jewish refugees from Spain and Portugal settled in Safed, and it became a center of scholarship and the seat of the Cabalist movement. It was here that the first printing press in the Near East was established (1577). Occupied by Napoleon in 1799, Safed became a Janizary headquarters and the seat of the governor, remaining so until 1837, when an earthquake leveled the city. A slow recovery took place during the second half of the 19th century. Of architectural interest, although simply built, are the synagogues of the Cabalists (16th–17th cent.). Relatively well preserved is the old fortified citadel of the 17th century. Buildings erected in modern times include the schools of the Alliance Israélite Universelle, a sanatorium, and hotels. An artists' colony has grown up in the rambling houses on the southwestern slope, and one old Arab building in this artists' quarter has been adapted to house a Museum of the Printing Arts.

Bibliog. S. Klein, Beiträge zur Geographie und Geschichte Galiläas, Leipzig, 1909, p. 58.

Chorazin (Korazim). From the synagogue that once stood here there remain some notable reliefs depicting mythological personages (Hercules, Medusa), centaurs in combat with lions, and scenes of rural life (the vintage).

Bibliog. H. Kohl and C. Watzinger, Antike Synagogen in Galilaea, Leipzig, 1916, pp. 41–58.

Lower Galilee. The less mountainous and more fertile portion of Galilee was also much more open to foreign influences: Lower Galilee, which in the Israelite period contained a nucleus of foreign population (hence the name Galil ha-Goyim, lit., "ring or circuit of Gentiles"), became a stronghold of Judaism in the time of the Second Temple and afterwards. It has remained a mixed area of various nationalities.

Sepphoris. Appearing first in the Hasmonean period, Sepphoris was a city that flourished in the Herodian period. As Diocaesarea it became one of the leading cities of Roman Galilee, while remaining purely Jewish; for a time it was the seat of the Sanhedrin. Even in Byzantine times Sepphoris retained its character as a focus of Judaism. Remains include a Roman theater, Byzantine mosaics, a long aqueduct, and a Crusader fortress, in the construction of which Roman sarcophagi were used.

Bibliog. L. Waterman et al., Preliminary Report of the U. of Michigan Excavations at Sepphoris, Palestine, in 1931, Ann Arbor, Mich., 1937.

Tiberias. Founded by Herod Antipas (A.D. 18–26) and named in honor of the emperor Tiberius, the city of Tiberias became the seat of the Sanhedrin and a center of rabbinic learning in the 2d century. Little of note remains from the Roman period; the Byzantine period is represented by the 6th-century mosaics from the thermae. The old town is dominated by the dark ruins of the Crusader citadel and of the old city wall, contrasting with the white buildings of the new city, which, following the lead of the suburb Kiryat Shemuel, extends up the hillside. A municipal museum contains a collection of antiquities found in the area.

Nazareth. The Church of the Annunciation, under construction in 1960, is the fourth structure to be erected on this important site in the life of Mary. Of the original Constantinian church, only a few mosaics and granite columns were found. From its successor, the triapsidal Crusader cathedral, there survive five capitals with fine Romanesque carving (12th cent.); these are preserved in the little Franciscan museum here. In the 17th century the local Arab authorities permitted the Franciscans to build a chapel on the presumed site of Mary's house, adjacent to the by then ruined Church of the Annunciation. Later, in 1730, the chapel was included in the construction of the third Church of the Annunciation, which followed a plan perpendicular to the Crusader church. Remodeled in 1877, the third church was pulled down in 1935 to make way for the present church, the plan of which follows the lines of the medieval structure of Crusader times.

Kopp, J. of the Palestine Exploration Soc., XVIII, 1938, pp. 187–228, XIX, 1939, pp. 82–119, 253–85, XX, 1940, pp. 29–42, XXI, 1941, pp. 148–64; B. Bagatti, Christian News from Israel, VI, 1955, pp. 28–31; B. Bagatti, Studium Biblicum Franciscanum Liber Annus, V, 1955, pp. 5–44.

Beth Shearim. Considerable archaeological interest attaches to this site on the southwest border of Lower Galilee. For a time the townlet served as the seat of the Sanhedrin (2d cent.); the burial here of the famous patriarch Judah I led to the establishment of a Jewish cemetery, serving places as far away as Palmyra. The cemetery continued in use up to the middle of the 4th century. Excavations within the town site have brought to light a synagogue of the transitional type and a basilica which probably housed judicial proceedings. The most interesting finds to date, however, are the 26 catacombs carved out of the slope of the hill on which the town stood, which have yielded mainly inscriptions (80 per cent in Greek) and rudimentary decorations (pl. 333). The catacombs are predominantly of the type consisting of a single rock-cut corridor with lateral burial halls, containing *arcosolia* or loculi, branching off at various levels. Different in type are Catacomb 11, adjoining a masonry mausoleum with sculptured decoration; Catacomb 14, with an arched masonry façade, probably the original burial cave of the patriarchs; and Catacomb 20, a huge cave containing over 200 sarcophagi, some decorated with reliefs of animals (in one case, decorated with a human face), and remains of marble coffins ornamented with mythological scenes.

Bibliog. N. Avigad, Israel Exploration J., IV, 1954, pp. 88–107, V, 1955, pp. 205–39, VII, 1957, pp. 73–92, 239–55, VIII, 1958, pp. 276–77; N. Avigad, Archaeology, VIII (1955), pp. 236–44, X (1957), pp. 266–69; B. Mazar, Beth She'arim, I, Jerusalem, 1957; M. Avi-Yonah, EAA, s. v Bet She'arīm.

Afula. Finds at this site in the plain of Esdraelon belong to the upper chalcolithic period, specifically to a subculture peculiar to the northern part of the country — the Esdraelon culture; it is characterized by pottery with a burnished-gray slip. In addition to this gray-burnished ware, remains of buildings with mud-brick walls and floors of black beaten earth were found.

Bibliog. E. L. Sukenik, J. of the Palestine O. Soc., XXI, 1948, pp. 1–78; M. Dothan, 'Atiqot, I, 1955, pp. 19–70.

The Jordan Valley. Enclosed as it is by cliffs and mountains, and in its lower portion far below sea level, the Jordan Valley has a climate that is tropical and generally insalubrious; nevertheless it has been densely settled through most of the historical epoch because of its fertile soil and abundance of water.

Einan (Ein Mallaha). Human remains belonging to the Mesolithic period have been found here. The remains of houses attest to the beginning of settlement; tombs in the form of circular pits with plastered and painted parapets, used for the burial of rulers, indicate the importance attached to orderly interment as a concomitant of magic or religious belief.

Bibliog. J. Perrot, Antiquity and Survival, II, 1957, pp. 91–110; J. Perrot, Israel Exploration J., X, 1960, pp. 14–22; E. Anati, Palestine before the Hebrews, New York, 1963, pp. 146–50, 172–75.

Hazor (Tell el-Qedah). In the middle Bronze Age, Hazor developed into a great city, almost 200 acres in extent; it continued to flourish into the late Bronze Age. The Canaanite city had underground burials in tunnels, a glacis with gates, and three sanctuaries, to one of which was attached a craftsmen's quarter (for potters, etc.). One temple, anticipating the plan of Solomon's Temple, was made up of a vestibule, a hall, and a holy of holies; the orthostat reliefs depicting a crouching lion, the sculptured altars, and the figures of the gods (both here and in another temple) attest to strong northern, in particular Hittite, influence. The Israelite town of Hazor, fortified by Solomon, was limited to the tell at the southwest corner of the site. Solomon erected a casemate wall and gate; Ahab added a citadel and various public buildings. An Israelite high place was among the structures brought to light here.

Bibliog. James A. de Rothschild Expedition at Hazor, Hazor, 2 vols., Jerusalem, 1958–60 (to be continued).

Capernaum (Kfar Nahum). The synagogue, of the late 2d-century of our era, represents the purest version of the early type: basilican, with a transverse row of columns in addition to the two longitudinal rows, and an adjoining colonnaded courtyard. The relief frieze, showing a mixture of religious and magic (e.g., fertility) symbols, is especially notable (pl. 334).

Bibliog. G. Orfali, Capharnaüm, Paris, 1922.

Tabgha (Heptapegon). The Church of the Multiplication of Loaves and Fishes, an early Byzantine basilica with transept, was adorned in the 5th century by a great master of mosaic with two pavement panels showing the fauna and flora of the Sea of Galilee. The style, clearly influenced by Nilotic landscapes, reveals a characteristic Byzantine blending of naturalistic treatment with the typical separation of images.

Bibliog. A. M. Schneider, Die Brotvermehrungskirche von et-tâbġa, Paderborn, 1934; M. Schapiro and M. Avi-Yonah, Israel: Ancient Mosaics, Greenwich, Conn., 1960, pls. I–III.

Khirbat Minye (Minim). The early Arab period is represented here by an Islamic palace of the Ommiad period (7th–8th cent.), a square about 250 ft. on a side, with angle towers. An ornamental gate gives access to a spacious court, with a ramp leading to the upper story. Several rooms and a mosque paved with geometric mosaics have been cleared in the excavation to date.

Bibliog. A. M. Schneider, Ann. archéologiques de Syrie, II, 1952, pp. 23–45; J. Perrot, O. Grabar, et al., Israel Exploration J., X, 1960, pp. 226–43; M. Schapiro and M. Avi-Yonah, Israel: Ancient Mosaics, Greenwich, Conn., 1960, pl. XXXII.

Beth Yerah (Khirbat Kerak). This site is most notable for its early Bronze Age buildings, including a large Π-shaped stone structure with places for nine silos. This communal granary could only have been erected by some well-established authority able to command forced labor. The early Bronze Age settlement was encircled by a thick wall of mud brick. Other finds at Beth Yerah include Hellenistic-Roman houses and a reused wall with brick superstructure, a rectangular Roman fortress into which a basilical synagogue was built at a later time, a church dated A.D. 529, and thermae that remained in use up to the Arab period.

Bibliog. B. Mazar et al., Israel Exploration J., II, 1952, pp. 165–73, 218–29; P. Bar-Adon, Israel Exploration J., III, 1953, p. 132, IV, 1954, pp. 128–29, V, 1955, p. 273; M. Avi-Yonah, EAA, s.v. Bet Yerah; P. Delougaz and R. C. Haines, A Byzantine Church at Khirbet Al-Karak, Chicago, 1960.

Shaar ha-Golan. Near this settlement is a site where archaeologists have been able to discern the transition in neolithic cultural development from the food-collecting to the hoe-agriculture stage. With this step was associated a fertility cult, attested by figurines and pebbles incised to resemble figurines. Pottery decorated with incised bands in a herringbone pattern also makes its appearance. Finds are displayed in a local museum.

Bibliog. M. Stekelis, Israel Exploration J., I, 1951, pp. 1–19; M. Stekelis, B. of the Israel Exploration Soc., XVIII, 3–4, 1954, pp. 185–89.

Beth Alpha. The ancient synagogue that was erected here in the early 6th century had a strictly basilican plan, with the apse oriented toward Jerusalem. The surviving mosaic pavement, executed in a rustic but vigorous style, depicts a Biblical scene of the Sacrifice of Abraham (pl. 337) and several symbolic motifs, including the signs of the zodiac and the seven-branched candlestick.

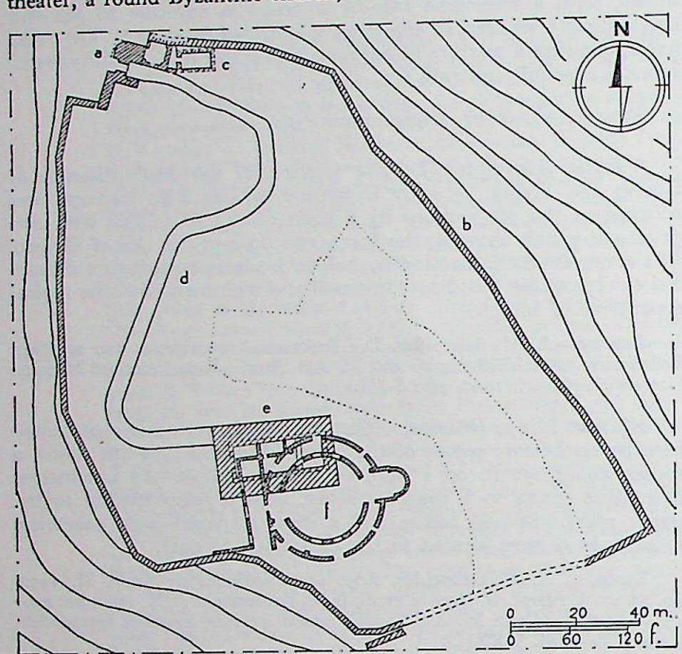
Bibliog. E. L. Sukenik, The Ancient Synagogue of Beth Alpha, Jerusalem, 1932; M. Schapiro and M. Avi-Yonah, Israel: Ancient Mosaics, Greenwich, Conn., 1960, pls. VI–XIV, p. 14.

Beth Shan (Beth Shean, Beisan, Scythopolis). The chief remains yielded by this site are four Canaanite temples of the late Bronze Age, which reveal a fusion of Canaanite, Egyptian, and Philistine elements. The occupation of this strategic city by Egyptian troops for three centuries, beginning under Thutmosis III (ca. 1469–1436 B.C.), left its mark on the plans and the decoration of these sanctuaries as well as their contents, which included a stele of Mekal (the local

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

Baal), steles of Seti I and Ramses II, a locally produced statue of Ramses III, and anthropomorphous sarcophagi apparently made for Philistine mercenaries in the Egyptian service. A fortress (*migdol*), a governor's residence, and a monumental silo represent the secular side of life in the Bronze Age city. In Hellenistic times the city (Scythopolis) expanded into the plain surrounding the tell, attaining its greatest prosperity in the Byzantine period. Among the finds of the post-Biblical periods should be mentioned a Hellenistic-Roman temple, a bust of Alexander, several decorated sarcophagi, a large Roman theater, a round Byzantine church, and a monastery dating from the



Beth Shan, plan of the citadel: (*a*) Gateway; (*b*) walls of the citadel; (*c*) reservoir; (*d*) road; (*e*) Hellenistic temple; (*f*) central-plan church (*from A. Rowe, 1940, pl. II*).

end of the 6th century; surviving mosaics that decorated the monastery depict the various agricultural labors of the months of the year, vintage scenes, and scenes of everyday village life. There is a local archaeological museum.

Bibliog. A. Rowe, The Topography and History of Beth-shan, Philadelphia, 1930; G. M. Fitzgerald, Beth Shan Excavations, 1921–23: The Arab and Byzantine Levels, Philadelphia, 1931; G. M. Fitzgerald, A Sixth Century Monastery at Beth-Shan, Philadelphia, 1939; A. Rowe, The Four Canaanite Temples of Beth-shan, I, The Temples and Cult Objects, Philadelphia, 1940; N. Zori, B. of the Israel Exploration Soc., XVIII, 1–2, 1954, pp. 78–90, XIX, 1–2, 1955, pp. 89–98; N. Tzori, PEQ, XL, 1958, pp. 44–51; M. Avi-Yonah, EAA, s.v. Beisan; M. Schapiro and M. Avi-Yonah, Israel: Ancient Mosaics, Greenwich, Conn., 1960, pls. XVII–XX.

The Phoenician coast. The narrow coastal plain extending from Acre northward belonged to Phoenicia in ancient times and is strongly marked with the impress of its culture.

Achzib (el-Zib). In the cemetery, which belongs to the Iron Age, the rock-cut tombs were in some cases closed with masonry dressed in the characteristic Phoenician manner of the 8th century B.C., exemplified also at Samaria. The funerary equipment is especially rich; it includes pottery vessels, masks, and figurines (of pregnant women, musicians, breadmakers) and models of boats.

Nahariya. A sanctuary and high place of the early to middle Bronze Age discovered in this seaside city were probably dedicated to Asherat-Yam (a manifestation of Astarte). Finds include figurines of the goddess in silver and bronze and offering vessels consisting of clusters of seven little cups.

Bibliog. I. Ben-Dor, Q. of the Department of Antiquities in Palestine, XIV, 1950, pp. 1–41; M. Dothan, Israel Exploration J., VI, 1956, pp. 14–25.

Evron. A Byzantine church here has a remarkable mosaic pavement dated by inscription (A.D. 415) and showing lavish use of the symbol of the cross. The Byzantine church at nearby Shavei Zion boasts a comparable 5th-century mosaic pavement.

Bibliog. M. Stekelis, 'Alon, II, 1950, pp. 29–30; M. Avi-Yonah, P. Kahane, and Y. Landau, 'Alon, V–VI, 1957, pp. 34–35; M. Schapiro and M. Avi-Yonah, Israel: Ancient Mosaics, Greenwich, Conn., 1960, pl. IV.

Acre, or Akko (Accho, Ptolemais, Saint-Jean-d'Acre). Near the modern city are the remains of a Hellenistic temple and of early Roman tombs with terra-sigillata pottery. From Crusader times there remain the crypt of St. John and a tower overlooking the Bay of Acre. After its capture and destruction by the Mameluke sultan in 1291, the city was abandoned, and it was not resettled until the Turks took possession in the 16th century. Acre acquired new importance in the 18th century as the seat of the emir Dāhir el-'Omar and his successor Aḥmad el-Jazzar, who rebuilt the fortifications. Occupied by Ibrāhīm Pasha of Egypt in 1832, the city reverted to the Turks in 1841, after which it underwent modest development through the establishment of defensive works and an increase in maritime traffic. Among the surviving monuments of the Turkish period are the double circuit of walls (late 18th cent.), in a good state of preservation; the mosque of Aḥmad el-Jazzar (1781), with spacious rectangular court surrounded by porticoes and galleries incorporating marble and granite columns taken from the ruins of ancient Ashkelon, Caesarea, Sidon, and elsewhere; the mausoleums of the pashas Aḥmad el-Jazzar and Sulaymān; the pasha's baths, Ḥammām el-Pāshā, erected in Arabic style by Aḥmad el-Jazzar about 1800, which houses the Akko Municipal Museum; the Jāmi' el-Raml ("Sand Mosque"); the Turkish arsenal (*jabakhāna*); and the great "white" market, Sūk el-Abiad. Other monuments that recall the Turkish period are the defense works of the old citadel, the guard towers, the Franciscan monastery and church (first half of 18th cent.), and the Turkish caravansary, Khān el-'Umdān, with a commemorative tower erected in 1906.

Bibliog. N. Makhouly and C. N. Johns, Guide to Acre, Jerusalem, 1946; R. Amiran, 'Alon, III, 1951, p. 37.

Mount Carmel and the plain of Sharon. The ridge of Mount Carmel with the adjacent coast down to the Yarkon River has in historic times been an area both of conflict and of give-and-take between the native cultures of the mountains and invading elements from overseas. But long ages before, the Carmel range, with its easily accessible caves, was a habitat of prehistoric man. The excavations of the caves of the Wadi Maghara, Abu Usba, Kabbara, and the Oren Valley have revealed a prehistoric culture extending from the Lower Paleolithic to the Neolithic era. In the Upper Paleolithic the region was inhabited by a race with mixed Neanderthaloid and *Homo sapiens* traits: Mesolithic burials were found with skeletons in a contracted position, an ornament of shells round the skull. Isolated finds include sculptures of animals and human beings, flint sickles, bone fishing hooks, and necklaces made up of teeth. In the chalcolithic period settlement appears to have shifted to the coast.

Bibliog. D. A. E. Garrod et al., The Stone Age of Mount Carmel, 2 vols., Oxford, 1937–39; M. Stekelis and G. Haas, Israel Exploration J., II, 1952, pp. 13–47; I. Wreschner, 'Alon, V–VI, 1957, pp. 49–56.

Haifa (Sycaminum?). The past history of the most important and modern port of Israel has left no monuments earlier than the Turkish period, though the site probably represents Sycaminum, a fishing village that goes back to late classical times and passed through the hands of the Crusaders, Ṣalāh ad-Dīn, St-Louis, and al-Ẓāhir Baybars before its occupation and fortification by the emir Dāhir el-'Omar in 1760.

The second largest of Israel's cities, Haifa extends up the slopes of Mount Carmel in three main sections. In the lower town, flanking the docks and the harbor, are the railroad tracks, shops and workshops, offices, warehouses, and plants; outstanding structures are a towering grain silo and a large government hospital. The Haifa Maritime Museum is in this part of the city. On the heights above this section is the part of the city known as Hadar ha-Carmel. In this residential-commercial district are the town hall, which also houses an art gallery and archaeological museum, the Great Synagogue, and the municipal theater. Fronting the municipal building, and overlooking the harbor, is a memorial garden, with a monument in honor of those who fell in the battle of Haifa (1948); this is on the site of the old Turkish fort that defended the town. An unusual monument of Haifa is the gold-domed Bahai shrine, set in an extensive Persian garden; opposite it is the International Bahai Archives building, modeled on the Parthenon. In Hadar ha-Carmel too is the old campus of the Israel Institute of Technology, or Technion, as it is better known, its central (the original) building of hewn stone in Moorish and Byzantine style.

In the section of Haifa on the summit of Mount Carmel, a spot of legendary beauty, modern suburbs of the city incorporate villas, public parks, and hotels. There is a Museum of Japanese Art. On the western promontory of the mountain, overlooking the sea is a Carmelite monastery whose history goes back to the 13th century; at the foot of the cape is the traditional cavern of Elijah, a shrine sacred to Jews, Moslems, and Christians. Opposite the monastery is the old Stella Maris lighthouse, which is still in use.

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

The environs of Haifa also take in the new campus of the Technion, Israel's primary institute for the training of engineers, architects, and scientists. The basic plan for these 300 acres on the eastern flank of Mount Carmel, designated as Technion City, was laid out by A. Klein. Of the complex of buildings that comprise the new campus, some thirty are in full use. They vary in style but all are in the modern tradition and are constructed of locally produced building materials. Representative are the Winston Churchill Auditorium (1958; A. Sharon and B. Idelson, architects), the Albert Einstein Institute of Physics (1958; N. Zalkind), the Fishbach Electrical Engineering Building (1957; A. Klein); the Samuel Fryer Aeronautical Engineering Building (1953; Y. Ratner), and the Hydraulics Center (1958; A. Mansfeld and M. Weinraub). Contemporary architectural trends are also exemplified in Haifa by the Youth Center, Beth ha-Rofe (House of Physicians), the Rothschild Hospital, the Kiryat Hayim commemorative monument (1950; M. Weinraub and A. Mansfeld), and the Center for the Reeducation of the Blind (M. Weinraub and A. Mansfeld).

Tell Abu Hawam. This small site at the foot of Mount Carmel was occupied from the late Bronze Age to the Persian period except for an interruption caused by the invasion of Sheshonk I (ca. 926 B.C.). Five strata have been uncovered, and finds include a temple, magazines, and a cemetery with Mycenaean pottery. A hoard of Tyrian coins was also brought to light.

Bibliog. R. W. Hamilton, Q. of the Department of Antiquities in Palestine, IV, 1935, pp. 1–69; B. Maisler, BAmSOR, CXXIV, 1951, pp. 21–25; E. Anati, 'Atiqot, II, 1959, pp. 89–102; N. Avnimelech, 'Atiquot, II, 1959, pp. 103–05.

Athlit. The beginnings of habitation at Athlit go back at least as far as the Iron Age. Phoenician settlers cremated their dead here. In the Persian period the site was occupied by Greek mercenaries and their native (or Egyptian) wives. The finds in the deep pit tombs include Attic pottery and Greek seals and weapons as well as Egyptian jewelry and amulets. The main ruins belong, however, to the Crusader period: a magnificent Templar castle with a double wall (an outer wall with a fosse and an inner with two high towers), an octagonal church, and vaulted halls and magazines. Adjacent to the castle was a *faubourg* with its own church, fort, and stables.

Bibliog. C. N. Johns, Q. of the Department of Antiquities in Palestine, II, 1933, pp. 41–104, III, 1934, pp. 137–64, IV, 1935, pp. 122–37, V, 1936, pp. 31–60, VI, 1938, pp. 121–52.

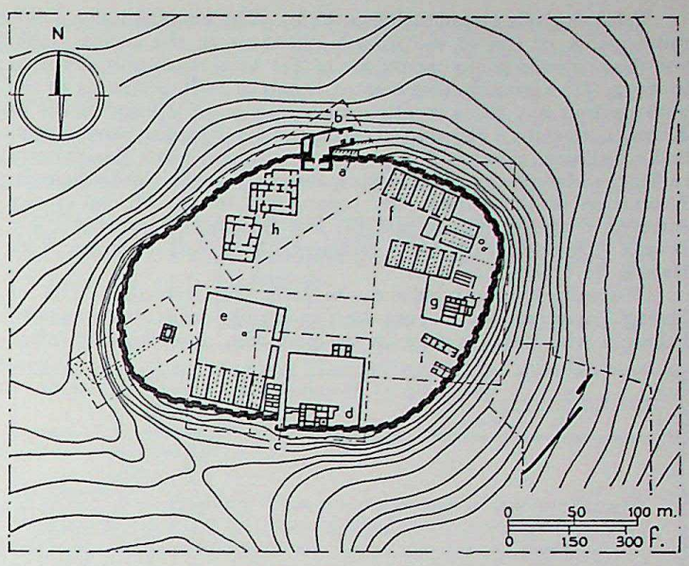
Dor (el-Burj). Tentative explorations have established the existence here of a city of the Bronze and Iron ages; remains of later periods include a Hellenistic temple and jetty, a Roman theater, and a Byzantine church.

Bibliog. J. Garstang, B. of the Br. School of Archaeol. in Jerusalem, 4, 1924, pp. 35–45, 6, 1924, pp. 65–73; J. Leibovitch, 'Alon, III, 1951, pp. 38–39, V–VI, 1957, p. 35.

Megiddo. The great Bronze and Iron Age site of the region, Megiddo is strategically located where the Valley of Iron (Wadi Ara) — which passed the Via Maris — opens into the plain of Esdraelon. Settlement dates from the chalcolithic age, but the main development began with the creation of the city-state in the early Bronze Age and continued into middle and late Bronze. The earlier strata include a Canaanite temple and high place; the late Bronze Age is represented by finds of ivory carvings and jewelry. In the Israelite period Solomon equipped the city with a casemate wall, gates, and stables; in the time of Ahab new stables were built. The Megiddo water system, which connected the city with a spring outside the city walls by means of a 300-ft. tunnel, belongs to the late Bronze Age. The Megiddo Museum is at the entrance to the site.

Bibliog. G. Schumacher and C. Watzinger, Tell el Mutesellim, 2 vols., Leipzig, 1908–29; H. G. May and R. M. Engberg, The Material Remains of the Megiddo Cult, Chicago, 1935; P. L. O. Guy and R. M. Engberg, Megiddo Tombs, Chicago, 1938; R. S. Lamon, G. M. Shipton, G. Loud, ed al., Megiddo, 2 vols., Chicago, 1939–48.

Caesarea (Caesarea Palaestina). Founded by Herod on the site of an earlier anchorage called Strato's Tower, Caesarea was the capital of Palestine for 600 years. Archaeological remains include a Roman and a Byzantine wall, a synagogue, two aqueducts, a hippodrome, a theater, an amphitheater, remnants of an open-air enclosure decorated by the Byzantines with Roman statues, and an extramural church with a mosaic pavement whose decorative motifs include animals and birds. Exploration of the site is still in its early stages. A small museum in the nearby kibbutz of Sedot Yam exhibits finds made at Caesarea.



Megiddo, archaeological plan showing levels V (1060–1000 B.C.), IV (1000–800 B.C.), and III (780–650 B.C.): (*a*) Fortification wall (levels IV–III); (*b*) north gateway (level III); (*c*) south gateway; (*d*) palace (level IV B); (*e*) south stables (level IV); (*f*) north stables (level IV); (*g*) residence (of the chief of the north sector of the city?; level IV); (*h*) structure surrounding open courts (level III); (*i*) sacred area of pre-Israelite times (level IV) (*from R. S. Lamon and G. M. Shipton, Megiddo, I, Chicago, 1939, fig. 3*).

Bibliog. S. Yeivin, Archaeology, VIII, 1955, pp. 122–29; M. Avi-Yonah, EAA, s.v. Caesarea; A. Frova et al., Caesarea marittima, Milan, 1959; M. Avi-Yonah, B. of the L. M. Rabinowitz Fund, III, 1960, pp. 44–48; M. Schapiro and M. Avi-Yonah, Israel: Ancient Mosaics, Greenwich, Conn., 1960, pls. XXIX–XXXI.

Meser. Through the excavations at this site in the Wadi Ara it is known that cisterns (for storing water) were dug with bronze adzes as early as the chalcolithic era.

Bibliog. M. Dothan, Israel Exploration J., VII, 1957, pp. 217–28.

Hadera. An important agricultural and communications center, Hadera has yielded, in the course of exploration, a number of pottery ossuaries shaped like miniature houses. There is a fine synagogue, and remains of an Arab caravansary have been found.

Bibliog. E. L. Sukenik, J. of the Palestine O. Soc., XVII, 1937, pp. 15–30.

The Philistine coastal plain. The area extending from the Yarkon River to the Sinai desert and from the sea to the Judean foothills is a broad, fertile plain dominated by a few great cities. It served as the Egyptian base of operations into Asia in the 2d millennium B.C.

Tell Qasila. Located on the Yarkon River, Tell Qasila was apparently a Philistine (late Bronze Age) foundation. The city was conquered by David and remained an important trading and administrative center of the Israelite monarchy until it was destroyed by Tiglathpileser III, in 732 B.C.; it revived in the Persian period. The finds that the site has yielded include a casemate wall, smelting ovens, and ostraca certifying the movement of oil and gold to and from the royal storehouses; some of the finds are exhibited in a building adjacent to the site of excavation.

Bibliog. B. Maisler, Israel Exploration J., I, 1950–51, pp. 61–76, 125–40, 194–218; Y. Kaplan, Israel Exploration J., VII, 1957, p. 265, VIII, 1958, p. 135.

Rosh ha-Ayin (Aphek, Antipatris). The early Bronze Age town was protected by a brick wall about 8 ft. thick. Rectangular pit graves found here are of a type unusual for the region; recesses in the stone-lined long sides of the tomb wall apparently served to hold remains of earlier burials. A Mameluke castle crowns the tell.

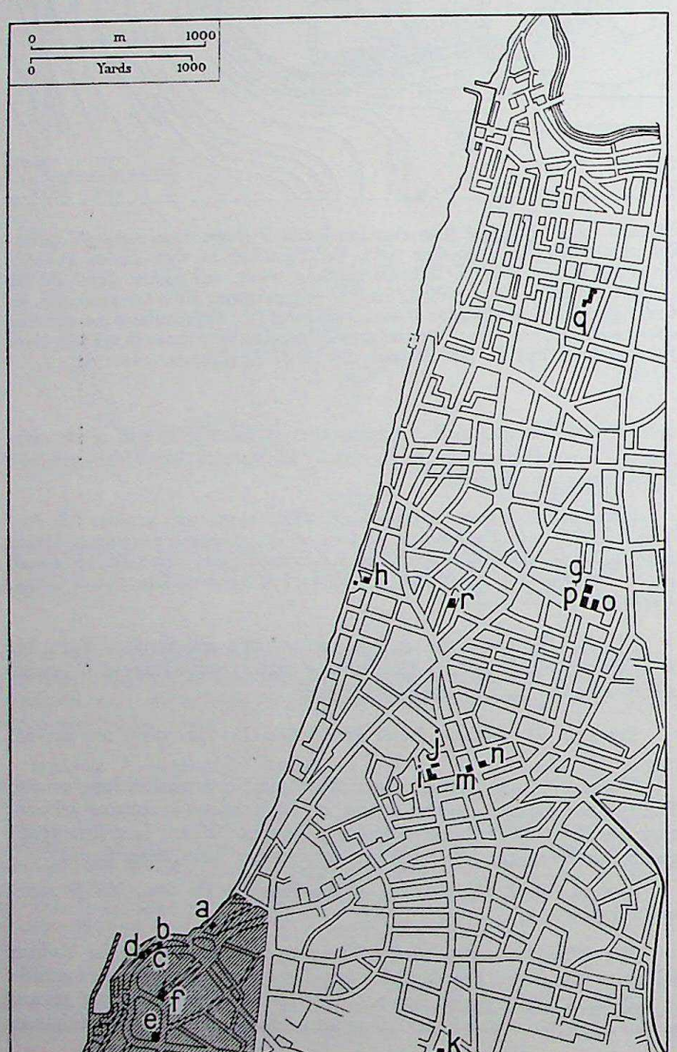
Tel Aviv-Jaffa (Jappho, Joppa, Yafo). The merging into a single municipality of one of the world's oldest ports, the ancient Jaffa, and the relatively young metropolis of Tel Aviv, north of it, occurred in 1954. The sparsely documented annals of Jaffa, beginning in the 16th century B.C. (it is mentioned on a pylon of Thutmosis III at Karnak), traverse a Phoenician phase (under Egyptian sovereignty) and a Philistine phase and record its establishment as a Jewish town under the Maccabees and its Roman, Byzantine, and Crusader periods. Excavation of the ancient city mound has to date yielded chiefly survivals from the middle and the late Bronze ages, notably a late Bronze Age brick wall and monumental gate, and inscriptions of Ramses II (1290–1223 B.C.).

Originally a suburb adjacent to Jaffa, Tel Aviv (lit., "Hill of Spring") was founded in 1909 by a group of Jewish immigrants to Palestine who were resident in the port city. A continuing influx



Tel Aviv-Jaffa. *Key*: (1) Jaffa area. Chief monuments: (*a*) Maḥmūdiya Mosque; (*b*) Casa Nova hospice; (*c*) Church of St. Peter; (*d*) Franciscan Monastery of St. Peter; (*e*) Tabitha Mission School, Church of Scotland; (*f*) French hospital; (*g*) Tel Aviv Museum, Helena Rubinstein Pavilion; (*h*) opera house; (*i*) Achad Haam House; (*j*) Tel Aviv Museum, Dizengoff House; (*k, l*) University of Tel Aviv; (*m*) Great Synagogue; (*n*) Great Sephardic Synagogue; (*o*) Mann Auditorium; (*p*) Habima Theater; (*q*) Assutah Hospital; (*r*) Bialik House.

stimulated the development of the new urban nucleus; it quickly recovered from the damage incurred in the course of World War II and the Arab-Jewish conflict of 1948 and took its place as Israel's first city, having absorbed the old town of Jaffa, in large part destroyed in the Arab-Jewish fighting. Among Jaffa's remaining monuments should be mentioned the earliest mosque (1730), which is close to the Franciscan Monastery of St. Peter and to the ancient lighthouse, and the Maḥmūdiya Mosque, with its fine fountain (1810); these stand on the ruins of the old fortified citadel. Jaffa's Museum of Archaeology exhibits antiquities found in the Tel Aviv and Jaffa area.

The city of Tel Aviv, built on sand dunes, is entirely European in planning and execution, the original plan being the work of the Scottish town planner Sir Patrick Geddes. Characterized by cubic buildings and ample gardens, the city has an industrial zone and model residential areas. Important buildings include the Great Synagogue (Israel's largest), the Great Sephardic Synagogue, the Assutah Hospital (1935; J. Neufeld), and the municipal buildings. Representative of contemporary international trends in architecture are the Histadrut building (1953; D. Karmi); the Lessin Cultural Center (A. Sharon and B. Idelson, architects), the Mann Auditorium (1953–57; Z. and J. Rechter and D. Karmi), the Beilinson Hospital (1958, A. Sharon and B. Idelson), the Sheraton Tel-Aviv Hotel (1955; W. J. Wittkower), the Dan Hotel (1955–56; H. Fenchel).

Tel Aviv has been from its beginning a center of culture and of art. The first Hebrew-language college, the Herzliya, was founded there in 1909. Three repertory companies have their permanent base in theaters in Tel Aviv — the Habima, the Ohel, and the Kameri (Chamber). Mograbi Hall and a new amphitheater in the exhibition grounds provide other settings for the performing arts. The Israel National Opera appears in an opera house near the sea. The Tel Aviv Museum came into existence in 1930; the permanent collections are in Dizengoff House (1936; C. Rubin), while temporary exhibitions are held in the Helena Rubinstein Pavilion (1953; D. Karmi and J. Rechter), which also contains a comprehensive art library. This museum owns an impressive collection of old and modern masters, and has built up an extensive collection of works by Israeli artists. Other museums in the city, in addition to the museum in Jaffa, include the Museum Haaretz — of which the Glass Pavilion (W J. Wittkower and E. W. Baumann, architects) is one of 14 planned to form eventually a museum of the civilizations of the eastern Mediterranean region — and the Historical Museum of Tel Aviv.

Bibliog. L'arch. d'aujourd'hui, VIII, 9, 1937, p. 26; J. Bowman, B.S.J. Isserlin, and A. Rowe, Proc. of the Leeds Philosophical Soc., IV, 1955, pp. 231–50; Y. Kaplan, Israel Exploration J., VI, 1956, pp. 259–60; L'arch. d'aujourd'hui, XXIX, 77, 1958/59, pp. 62–69.

Azor (Yazur). The earliest settlements of which there is evidence in this general region are the chalcolithic sites here; the tomb caves yielded a great quantity of house-shaped ossuaries, as well as some in the form of a human face.

Bibliog. M. Dothan, Israel Exploration J., VIII, 1958, pp. 722–74; J. Perrot, Israel Exploration J., IX, 1959, pp. 266–67.

Lod or Lydda (Diospolis, Ludd). The Church of St. George, like the mosque next to it, stands on Crusader foundations. It incorporates remnants of the medieval structure, which had in turn been erected on the ruins of a Byzantine church built, according to tradition, over the shrine of St. George; a 6th-century inscription on a pillar in the mosque remains from the Byzantine church. North of the city is a noteworthy Islamic monument of the 13th century, a stone bridge built by the Mameluke sultan al-Ẓāhir Baybars. Since Biblical times an important crossroads, Lod is Israel's international airport.

Bibliog. C. Enlart, Les monuments des croisés dans le royaume de Jérusalem . . ., 4 vols., Paris, 1925–28, s.v. Lydda; Y. Kaplan, 'Alon, V–VI, 1957, p. 39.

Ramla. The Great Mosque that stands in the center of Ramla was originally a Crusaders' church of the 12th century. From the 8th century there remain Uneiziya cisterns with pointed arches. The square tower that dominates the town dates from 1318; it was once the minaret (and is all that remains) of a large mosque.

Bibliog. C. Enlart, Les monuments des croisés dans le royaume de Jérusalem . . ., 4 vols., Paris, 1925–28, s.v. Ramleh; J. Kaplan, 'Atiqot, II, 1959, pp. 106–15.

Ashkelon (Ascalon). The oldest settlement here must date back at least as far as the early Bronze Age, but the accumulation of later remains on this site is so great that the excavators have reached no further than the late Bronze level, with its sub-Mycenaean pottery. The chief remains that have been brought to light are a 3d-century bouleterion with relief sculptures (Nike, Atlas, Isis) and an adjacent portico. Other finds include a Roman painted tomb and a Byzantine-Crusader wall.

Bibliog. J. Garstang and W. J. Pythian-Adams, Palestine Exploration Fund Q. Statement, XLIII, 1921, pp. 12–16, 73–75, 163–69, XLIV, 1922, pp. 60–84, 112–19, XLVI, 1924, pp. 24–35; J. Ory, Q. of the Department of Antiquities in Palestine, VIII, 1939, pp. 38–44; J. Perrot, Israel Exploration J., V, 1955, pp. 270–71; M. Avi-Yonah, EAA, s.v. Ascalon; J. Praver, Erets Yisrael, V, 1958, pp. 224–37.

Tell Jemmeh (Tell Gamma). The earliest excavated strata at this site belong to the middle Bronze Age. In the late Bronze Age

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

the city was occupied for a long time by Egyptian troops (18th and 19th dynasties), and in the Iron Age it apparently served as a base both for the Assyrians and for the Persians in their operations against Egypt; numerous foundries and silos, as well as limestone altars with incised designs, belong to these periods. In the Persian period the town served as a transit station for Greek trade with the Nabateans, hence the finding of a relatively great quantity of Attic shards.

Bibliog. W. M. F. Petrie, Gerar, London, 1928; B. Maisler, PEQ, LXXXIV, 1952, pp. 48–51.

Maon (Nirim). A mosaic pavement from an ancient synagogue was found here. This late-6th-century work, showing a mixture of animal and symbolic decoration, is in the Archaeological Museum in Jerusalem.

Bibliog. Israel Exploration J., VII, 1957, p. 265; M. Avi-Yonah et al., B. of the L. M. Rabinowitz Fund, III, 1960, pp. 6–40; M. Schapiro and M. Avi-Yonah, Israel: Ancient Mosaics, Greenwich, Conn., 1960, pls. XXIV–XVII and p. 22.

Sharuhen (Tell el-Fara). Contemporary with the chalcolithic sites at Azor are a series of settlements along the valley passing Sharuhen. The tell itself was apparently settled at the end of the early Bronze Age; its principal remains include fortifications attributed to the Hyksos and houses of the Tell el-'Amarna type from an Egyptian colony. Initially the Iron Age brought destruction, but the site was reoccupied either by the Israelites or by the Philistines, and it remained settled through Iron Age I and II. Among the tombs found here were some with anthropomorphous sarcophagi resembling those of Beth Shan. Perhaps the earliest fortified gateway found to date in the Palestinian area is one discovered at this site.

Bibliog. W. M. F. Petrie, Beth Pelet, I, London, 1930; E. Macdonald et al., Beth Pelet, II, London, 1932.

The Shephala. The name (lit., "lowlands") denoting this area, which includes the Judean foothills, represents the point of view of the Israelites who inhabited the mountains. The Shephala was in all periods the scene of strife between the people of the mountains and those of the plain, and its passes are guarded by an imposing number of tells. Archaeological investigation to date indicates that these ancient city mounds were first inhabited by chalcolithic cave dwellers, whose occupation of them marked the beginning of Canaanite urbanism in the early Bronze Age. These cities reached their highest point in the late Bronze Age and maintained their position in the Iron Age, declining for the most part in the Hellenistic and Roman periods.

Gezer. The northernmost of the cities of the Shephala, Gezer was first inhabited by chalcolithic cave dwellers, who were able to erect a rough wall on top of the mound; it began to exist as a city in the early Bronze Age. The caves were converted into burial places and a high place with steles was established. In the middle Bronze Age an inner wall was added to the city fortifications and a tunnel was dug to reach a spring at the foot of the mound. The late Bronze period was one of great prosperity for the city, with evidence of a marked increase in Egyptian and Aegean influences. Magazines were now provided in abundance, and a new wall was built. When Solomon took possession of Gezer, a casemate wall was built, with a fortified gate following the plan of those at Hazor and Megiddo. The famous Gezer calendar, a limestone tablet bearing a list of agricultural activities arranged by months, belongs to the Israelite age. Contracts in cuneiform remaining from the Assyrian and Neo-Babylonian periods show that the city continued to exist after 586 B.C.. In the Hellenistic period Gezer was a stronghold of the Seleucids until its capture by Simon the Hasmonean, who made it the site of a palace and a fortress. Inscriptions from this time mark the Sabbath boundary of the city (i.e., the walking distance permitted).

Bibliog. R. A. S. Macalister, The Excavation of Gezer, 3 vols., London, 1912; A. Rowe, PEQ, LXVII, 1935, pp. 19–33.

Shaalabbin (Shaalvim). Among the remains of the ancient Samaritan synagogue discovered here is an interesting mosaic which is in a class by itself, no others of its kind having yet been found.

Bibliog. E. L. Sukenik, B. of the L. M. Rabinowitz Fund, I, 1949, pp. 25–30.

Beth Shemesh. Apparently founded in the early Bronze Age, Beth Shemesh was devastated in the middle Bronze Age and was refortified in the Hyksos period; in addition to these fortifications, a Hyksos necropolis has been found here. After the Hyksos period Beth Shemesh came under the domination of the Egyptian New Kingdom, reaching its zenith under the 19th dynasty (the finds include an 18th-dynasty marriage scarab of Amenhotep III and Queen Tiy). The city continued to exist, with Israelites and Philistines contesting for domination, well into Iron Age I; at some point during this phase it suffered destruction at the hands of the Israelites. In Byzantine times a large monastery was established on the ruins.

Bibliog. D. MacKenzie, Palestine Exploration Fund Ann., I, 1911, pp. 41–94, II, 1912–13, pp. 1–39; E. Grant, Beth Shemesh, Haverford, Pa., 1929; E. Grant, Ain Shems Excavations, 5 vols., Haverford, Pa., 1931–39; M. Avi-Yonah, EAA, s.v. Bet Shemesh.

Tell es-Safi. A town existed on this site from the early Bronze Age through Iron Age II, as well as in the Hellenistic period. The archaeological remains from these times suffered by the erection here of the Crusader castle of Blanchegarde in 1140.

Bibliog. F. J. Bliss and R. A. S. Macalister, Excavations in Palestine, 1898–1900, London, 1902.

Azekah (Tell Zakhariya). This site developed in the middle and late Bronze Age, and the Israelites fortified it with a citadel; a Hellenistic level was also found in the upper part of the mound.

Bibliog. F. J. Bliss and R. A. S. Macalister, Excavations in Palestine, 1898–1900, London, 1902.

Tell el-Judeida (Maresheth Gath). An early Roman villa has been discovered here.

Bibliog. F. J. Bliss and R. A. S. Macalister, Excavations in Palestine, 1898–1900, London, 1902.

Beth Guvrin (Eleutheropolis, Beit Jibrin). After the Israelite city of Maresha was destroyed, in 40 B.C., a new town rose on an adjacent site and took its place. This town, which later acquired the name of Eleutheropolis, has yielded a series of fine Byzantine mosaics.

Bibliog. L. H. Vincent and F. M. Abel, RBib, XXXI, 1922, pp. 259–81, XXXIII, 1924, pp. 583–604; M. Avi-Yonah, EAA, s.v. Bet Gubrin; M. Schapiro and M. Avi-Yonah, Israel: Ancient Mosaics, Greenwich, Conn., 1960, pls. XV, XVI.

Maresha (Marisa, Tell Sandahanna). The Hellenistic town of Marisa was inhabited chiefly by Sidonians; their painted tombs show the characteristic combination of religious symbols with representations taken from natural history and mythology. The city itself was built on a Hippodamian plan and was provided with many caravansaries; caves and silos attest to its industrial and agricultural activity, while a multitude of Rhodian jar handles give evidence of widespread trade relations. Incantation texts and magical figurines show that Hellenistic enlightenment had to contend with a strong inclination to magic.

Bibliog. J. F. Bliss and R. A. S. Macalister, Excavations in Palestine, 1898–1900, London, 1902; J. P. Peters and H. Tiersch, Painted Tombs in the Necropolis of Marissa, London, 1905.

Lachish (Tell ed-Duweir). First settled by chalcolithic cave dwellers, the site acquired a wall and glacis in the middle Bronze Age. In the late Bronze Age a small temple was built in the fosse of the city. About 1230 B.C., destruction visited the city, and this disaster supplies an important clue to the dating of the Israelite invasion. In the Iron Age a new city rampart was constructed, with a double line of walls and a ramp leading up to the gate; this wall is depicted in Assyrian representations of the siege of Lachish by Sennacherib in 701 B.C. The Israelite city was a fully developed trade center, guarded by a fortress; in the Persian period this was replaced by a residence and temple of the sun. In the guardhouse near the gate were found the documents known as the "Lachish letters," ostraca with the correspondence of the city commander in the last days before the Babylonian invasion of 586 B.C.

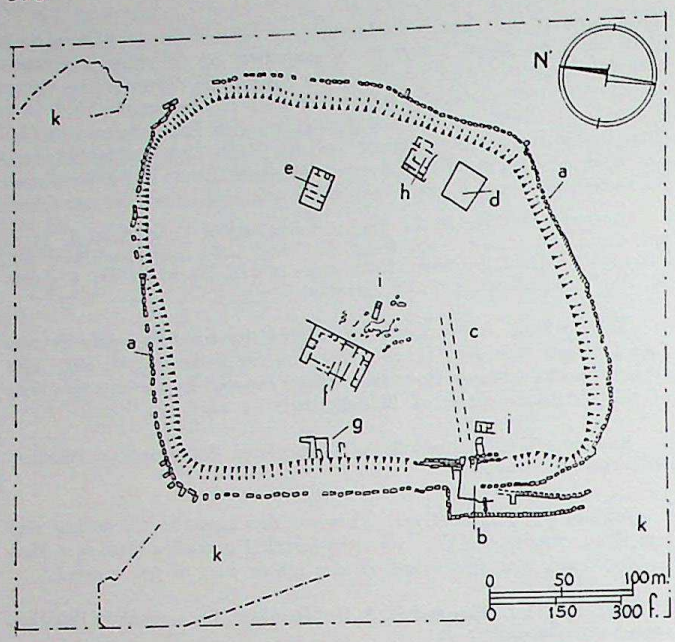
Bibliog. Lachish (The Wellcome Marston Archaeol. Research Expedition to the Near East Pubs., I–IV), 4 vols., London, New York, 1938–58.

Tell el-Hesi (Eglon?). The first Palestinian site whose stratification and pottery have been closely studied, Tell el-Hesi came into existence in the early Bronze Age. In the middle Bronze Age it was fortified with a glacis. The town reached its highest development in the late Bronze Age.

Bibliog. W. M. F. Petrie, Tell el Hesy, London, 1891; F. J. Bliss, A Mound of Many Cities, London, New York, 1894.

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri



Lachish, archaeological plan. Chief monuments: (*a*) Fortification wall: (*b*) bastions and gateway with access ramp; (*c*) street; (*d*) great cistern; (*e*) sun temple; (*f*) royal palace; (*g*) private house; (*h*) unidentified structure; (*i*) rooms and trenches east of the palace; (*j*) house near the gateway; (*k*) cemeteries outside the walls (*from Lachish, The Wellcome Marston Archaeol. Research Expedition to the Near East Pubs., III, pl. 108*).

Tell Beit Mirsim (Debir?; Kiryat-sepher?). Occupation of this site extends over the period from the early Bronze Age to the 6th century B.C. Fifteen successive strata were discovered in the mound, which had a Hyksos glacis of the middle Bronze Age. A high place with the stele of a serpent goddess and numerous alabaster vessels is also middle Bronze. The late Bronze Age yields little; to it belong magazines of the Cretan type and a letter in cuneiform. A polygonal citadel protected the Israelite city, which was provided with a casemate wall and numerous silos, and there are remains of an active dyeing industry.

Bibliog. W. F. Albright, Ann. of the American Schools of Oriental Research, XII, 1932, pp. 1–165, XIII, 1933, pp. 55–127, XVII, 1938, pp. 1–96, XXI–XXII, 1943, pp. 1–230.

Jerusalem and environs. The corridor leading up to the Holy City, established by Israel in the war of 1948–49 and retained by the terms of the armistice agreements, includes most of new Jerusalem; the greater part of the Old City remains within Jordanian boundaries. The Jerusalem Corridor is a segment of the Judean hills, which rise between the coastal plain and the Jordan Valley.

Abu Ghosh (Kiryat Yearim). At this site, doubtless the most interesting, prehistorically, in the Jerusalem Corridor, finds of the Neolithic period — both pottery and the remains of a square building — indicate Syrian influences penetrating Palestine at this early stage; at the other end of the historical scale is the 12th-century Crusaders' church built on the remains of a Roman structure, perhaps a reservoir.

Bibliog. R. de Vaux and A. M. Steve, Fouilles à Qaryet el-'Enab, Paris, 1950; J. Perrot, Syria, XXIX, 1952, pp. 119–45.

Jerusalem (Urusalim, Hierosolyma, Aelia Capitolina). Archaeological evidence going back to the early Paleolithic era and documents going back to Akkadian cuneiform and Egyptian hieroglyphic inscriptions begin the long story of the continuous life of Jerusalem as an inhabited city — one of the longest in the world. The Scriptures and the ancient histories carry the account of the royal city of David and of Solomon — the site of Solomon's Temple and the capital of the kingdom of Judah — down through its Roman, Byzantine, Persian, and Moslem periods, through the Crusaders' Latin kingdom, whose capital it was, to the dawn of modern times, when the Holy City was in the hands of the Turks. Whatever traces remain from these early eras are chiefly in old Jerusalem, within the borders of Jordan (q.v.). Of the Old City, Israel has retained only Mount Zion, with the so-called "Tomb of David," which was perhaps originally a late Roman synagogue (the Cenacle, or Hall of the Last Supper, above the tomb is a 14th-century Gothic structure). Also visible on Mount Zion are remains of the Hasmonean First Wall of historic Jerusalem. Other archaeological monuments within Israeli borders are various rock-cut tombs in the city and its vicinity. Among these is the cave that was the burial place of Herod's family, with a rolling stone to close the entrance and its interior faced with stone slabs. In the upper Valley of the Kidron is the cave containing the tombs of the Sanhedrin ("Tombs of the Judges"), the entrance to which has a fine pediment filled with floral decoration in relief. A rock-cut tomb of the Hasmonean period discovered in 1956 in Rehavia is embellished with wall decorations that include graffiti representing seven-branched candlesticks and drawings representing a maritime battle. At Givat Ram, west of the city, remains of a brick factory of the Roman Legio Decima Fretensis were found, and, near them, of a mid-5th-century church and hospice for the aged built by the empress Eudocia. In the upper reaches of the Hinnom Valley two Iron Age tombs have been discovered. The Israel Department of Antiquities maintains an Archaeological Museum in Jerusalem displaying a collection of finds from sites all over the country.

In the final period of Turkish rule Jerusalem expanded outside the 16th-century walls of the Old City; residential quarters grew up and institutions were founded to accommodate communities and pilgrims from all over the world. Under the Mandate this new Jerusalem expanded still further, adding, within the town, modern buildings to accommodate government and business and, in outlying sections, residential suburbs and parks. It was during this time that the ruling was put into effect that all buildings in Jerusalem be constructed of or faced with the fine limestone in which the site abounds. Among the structures that should be mentioned are the municipal building, the law courts, the Jewish Agency building (1930; Y. Ratner), the original Bezalel National Museum (1906; new buildings are under construction), the Y.M.C.A. (1928), with its tower overlooking the entire city, and the King David Hotel.

A city with more religious associations than any other in the world, Jerusalem has a great number of religious structures. An impressive example is the Hechal Schlomo, the seat of the Chief Rabbinate. The largest and most imposing of the many synagogues is the Yeshurun Synagogue (1934–35; E. Stolzer, M. Robin, R. Friedman). In contemporary style are the synagogue on the campus of the Hebrew University (H. Rau, architect) and the synagogue of the Hebrew University-Hadassah Medical Centre (1962, J. Neufeld, architect); the latter has 12 stained-glass windows, representing symbolically the 12 tribes of Israel, created for it by Marc Chagall (1959–61). In 1963 the Hebrew Union College Biblical and Archaeological School (H. Rau, architect) was completed. Among the noteworthy Christian edifices are Notre-Dame-de-France Monastery, the Pontifical Biblical Institute (1927), Ratisbonne Monastery (1874), Terra Sancta Monastery, the French Lazarist Monastery, the Convent of the Poor Clares (1914), St. Vincent de Paul Convent, St-Rosaire Convent, and the Church and Monastery of the Dormition (1900–10; restored) on Mount Zion, all Roman Catholic; the Monastery of the Cross, the Monastery of St. Simeon, and the Monastery of the Evil Counsel, all Greek Orthodox; the Russian Cathedral and the Church of St. John, both Russian Orthodox; the Abyssinian Monastery and Church, of the Coptic rite; and the Scottish Church of St. Andrew and the Swedish Theological Institute. The Italian and the French hospitals should also be mentioned.

Since the establishment of the State, Jerusalem, as the capital, has been the scene of accelerated building activity. In addition to industrial centers, hotels, apartment blocks, and schools, such projects as the rebuilt Convention Center and the Beth Ha'am (House of the People) are part of this development. Many important monuments are in progress. A group of government buildings, including the new quarters for the Knesset, is partially completed on the Kirya (Capitol) to the west of the city; on another hilltop will stand the Israel National Museum of Art and Archaeology, in gardens designed by Isamu Noguchi. Just west of these locations is the complex of buildings comprising the Hebrew University, whose campus occupies 236 acres. The University buildings are a notable example of the felicitous use of the local limestone; its rich tone is ingeniously set off by the contrasting shades of stones and marbles quarried in other parts of Israel. Among the units completed in the first four years of construction (1954–58) are the administration building and auditorium (D. and R. Karmi, Z. Melzer, architects), the physics and botany laboratory (D. A. Brutzkus), the physical and inorganic chemistry compound (A. Sharon and B. Idelson), the school of economics and social sciences (A. Yaski and S. Powsner), the Institute for Jewish Studies (M. Weinraub and A. Mansfeld), the faculty of letters building (A. Yaski and S. Powsner), the school of archaeology (Z. and J. Rechter, M. Zarhy), the library (A. Alexandroni, Z. Armoni, H. Havron, M. and S. Nadler, S. Powsner, A. Yaski), the youth hostel (A. Sharon and B. Idelson), the stadium (J. Klarwein), and an open-air theater seating 3,000 (S. Mestechkin). The Hebrew Language Academy (1959; L. Attias and A. Kashtan) is housed in

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

another of the campus buildings. The Medical School of the University will form part of the Hebrew University-Hadassah Medical Center, an impressive modern complex of buildings (J. Neufeld, architect) on the nearby hilltop overlooking Ein Karem; the synagogue of the Center contains the Chagall windows mentioned above. All but two of the main buildings of this, the largest medical complex in the Middle East, have been completed and are in use.

Two of the most striking monuments of the new Jerusalem are the Tomb of Theodor Herzl (J. Klarwein, architect), crowning the terraced War Memorial Cemetery on Mount Herzl, and on the same ridge, on Har ha-Zikaron (Hill of Remembrance), a memorial to the six million victims of the Nazi regime, erected by the Yad Vashem and including a building to house its offices, archives, and library, a memorial shrine, and an exhibition hall (1961; A. El-Hanani, B. Idelson, and A. Sharon), a museum (in progress), and a synagogue (in progress)—all standing on an immense open concrete platform, the Memorial Square.

Manahath. At this site near Jerusalem several tumuli have been cleared: heaps of stones up to 20 ft. high and 110 ft. in diameter, surrounded by a low retaining wall. Beneath the tumuli have been found traces of cult installations. The purpose of these constructions, which date from the 7th century B.C., is debated; some hold that they were tombs (although no actual burials were found in them), while others incline to the view that they were high places and were deliberately obliterated by Josiah, king of Judah.

Bibliog. R. Amiran, Israel Exploration J., VIII, 1958, pp. 205–27.

Ramat Rahel. Another archaeological site of major importance in the vicinity of Jerusalem is near the kibbutz of Ramat Rahel. Remains include a Byzantine monastery and church (perhaps the famous Church of the Kathisma), a settlement from the time of the Second Temple, and a Judean royal fortress founded in the 8th century B.C., with a casemate wall and a residence in which proto-Aeolic capitals were an architectural feature. The site continued to be inhabited into the Persian period; it has yielded numerous stamped jar handles, some marked *lammelekh* ("belonging to the king") and bearing the name of a city (four cities are represented); other jar handles are stamped with the name of the province (Yehud, or Judea) and in some cases also with the name of the governor.

Bibliog. Y. Aharoni, Israel Exploration J., VI, 1956, pp. 102–11, 137–55; Rome, Univ., Missione archeol. nel vicino oriente, Il colle di Rachele (Ramat Rachele), Rome, 1960; A. Ciasca, R. degli studi orientali, XXXVI, 1961, pp. 13–17; P. Testini, The "Kathisma" Church and Monastery, Excavations at Ramat Rahel, Seasons 1959 and 1960, Rome, 1962.

The Negev. The southern part of Israel, south of a line extending rom Gaza via Beersheba to Ein Gedi on the Dead Sea, is a dry area, at present cultivable only in its northern section. The southern part of the Negev is desert except for a few watering places, where forts were built in Nabatean and Roman times. The intensive exploration of this region with a view toward settlement has led to many discoveries that have radically altered concepts of the history and morphology of the remains.

Bibliog. F. Frank and A. Alt, Z. der D. Palästina Vereins, LVII, 1934, pp. 191–280, LVIII, 1935, pp. 1–78; N. Glueck, Rivers in the Desert: A History of the Negev, Philadelphia, 1959.

Wadi Hever. The caves here were the last refuge of the defeated remnants of Bar Kokhba's army; they have yielded letters and documents, booty taken from the Romans, and many household utensils, weapons, and articles of clothing; even remains of food have been found.

Bibliog. Y. Aharoni, Israel Exploration J., IV, 1954, pp. 126–27, V, 1955, pp. 272–73.

Masada (el-Sebbe, Metsada). The fortress, on a rocky eminence west of the Dead Sea, was founded in the Hasmonean period; it was extended and embellished by Herod, who provided it with huge cisterns (fed by two aqueducts), a storehouse, an arsenal, barracks, and two palaces, one of which was daringly built, in three levels, on the northern extremity of the rock. The earliest mosaics found in Israel were discovered here. The last stronghold of the Zealots, Masada was taken by the Roman army A.D. 73 after a long siege, evidences of which can still be clearly discerned.

Bibliog. M. Avi-Yonah et al., Masada, Survey and Excavations, 1955–56, Jerusalem, 1957.

Beersheba. The earliest settlements in the area belong to a subdivision of the chalcolithic culture. At first the inhabitants lived in artificial caves dug in the soft loess of the area; only in the last phase of their settlement did they build houses. They practiced agriculture and animal husbandry, as is evidenced by their silos and the bones found in the houses. Most of the utensils were either pottery or finely polished stone vessels, though in this culture the technique of metal casting was known and was practiced extensively, copper ore being mined at several sites, including the Araba Valley. The artistic production, mainly small ivory statuettes of men, women, and animals, was on a very high level. The Negev Museum in Beersheba exhibits finds from regional excavations.

Bibliog. J. Perrot, Israel Exploration J., V, 1955, pp. 17–40, 73–84, 167–89; M. Dothan, 'Atiqot, II, 1959, pp. 1–42.

Halutsa (Elusa, Khalasa). In ancient times the principal city of the Negev, Halutsa was founded by the Nabateans, and it prospered under the Byzantine Empire. The despoiled ruins that remain have yielded mainly inscriptions.

Bibliog. C. Woolley and T. E. Lawrence, The Wilderness of Zin, London, 1936.

Nitsana (Nessana). A late Roman and Byzantine center of some importance, this city continued in existence after the Arab conquest. Finds of papyri made in the ruins throw valuable light on the administration and economics of the Byzantine and early Islamic periods; among them were literary works in Greek and Latin.

Bibliog. Colt Archaeol. Expedition, 1936–1937, Excavations at Nessana, II–III, Princeton, 1950–58.

Shivta (Subeita). This agricultural city was founded in the 1st century B.C. and continued into the Byzantine period. It had three churches, several hundred houses, grouped round a public pool, and a square that served as a commercial center.

Bibliog. C. Woolley and T. E. Lawrence, The Wilderness of Zin, London, 1936.

Avdat (Eboda). Built round a temple with the remains of the deified king Obodas, Avdat, whose beginnings go back to the 3d century B.C., flourished as a Nabatean settlement until A.D. 106, when the Nabatean kingdom was annexed by Rome. That it was a center of trade and industry is apparent from the remains that came to light through the discovery of a pottery kiln, surrounded by extensive dumps. The city revived under Roman rule in the second half of the 3d century of the current era; the Roman finds include remains of a camp. In the Byzantine period two churches and a fortress were erected on the summit of the town hill; in the slope of the hill a number of dwelling caves have been excavated. The distinctive Nabatean art is a blend of Hellenistic and Eastern influences; it is represented by a find of small bronzes, as well as by a mass of painted pottery.

ITALIAN ART. A basic phenomenon in Italian art from the middle of the 13th to the end of the 15th century was the development of distinct schools dominated by the personalities of great innovators or by the individual characteristics of various centers. This regional individuality resulted from the political division of the country into small states, each of which had its own particular history (albeit within the larger framework of a common cultural heritage). This independence is reflected in the precocious appearance of "local" art-historical literature devoted to the individual schools. (In fact, the various characteristics of these schools had been distinguished in 17th-century historical writings.) But because of more active cultural exchange among the various centers, local differences began to

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

diminish in the 16th century. From that time on, the schools were determined less by local cultural life than by the stylistic tendencies of the dominant artistic personalities, who created currents of taste that no longer represented single geographical centers but were sometimes international in scope (e.g., the schools of Caravaggio, Bernini, and the Carraccis).

The aim of this article is not to trace the development of Italian art through the works of the great masters but, on the contrary, to characterize individual schools and their particular histories. See also ROMANESQUE ART; GOTHIC ART; RENAISSANCE; MANNERISM; BAROQUE ART; ROCOCO; NEOCLASSIC STYLES.

SUMMARY. Lombard art from the Romanesque period to the Renaissance (col. 379). The Pisan school and its sphere of influence (col. 386). Florentine art from the Romanesque period to the Renaissance (col. 388). The Sienese school (col. 394). Central and southern Italian art to the 15th century (col. 398): *Southern Italy; Umbria; the Marches; the Abruzzi.* Art in Rome and Latium to the pontificate of Julius II (col. 412). The Emilian school from the Romanesque period to the 16th century (col. 416). Venetian art from the Romanesque period to the 16th century (col. 424). Roman art from the pontificate of Julius II to the end of the 18th century (col. 434). The Tuscan school from the mannerist period on (col. 444). The Emilian school in the 17th and 18th centuries (col. 448). Neapolitan and Sicilian art from the 16th century on (col. 453). The Venetian school in the 17th and 18th centuries (col. 458). Regional schools of northern Italy (col. 463): *Lombardy from the mannerist period to the end of the 18th century; Piedmont; Liguria.* The 19th century (col. 472).

LOMBARD ART FROM THE ROMANESQUE PERIOD TO THE RENAISSANCE. Although the influence of Byzantine art affected several parts of Italy, that courtly and cosmopolitan style was uncongenial in its nature to the tendencies of the Middle Ages that were to culminate in Romanesque art (see BYZANTINE ART; CAROLINGIAN PERIOD; EUROPE, BARBARIAN; OTTONIAN PERIOD; PREROMANESQUE ART; ROMANESQUE ART). It was not until the Romanesque phase, after the year 1000, that individual developments characterized the several regions — forerunners of modern nation-states. This occurred despite extensive cultural interchange with Byzantium. Paradoxically, this interchange acted more as a catalyst of the various regional Romanesque styles than as a unifying element.

Lombardy supplied the strongest impetus in the creation of the Italian Romanesque. As early as the 9th century Lombard religious edifices exhibited elements that were to distinguish Lombard construction — loggias applied to the exteriors of apses, piers supporting vaulted roofs, and crypts surmounted by elevated choirs. In the 12th century, following the construction of S. Ambrogio in Milan (10th–11th cent.), this building style was used in the churches of S. Michele in Pavia, S. Abbondio and S. Fedele in Como, and S. Maria Maggiore in Bergamo. Lombard forms spread to Modena, where in 1099 Lanfranco began the Cathedral, another fundamental monument of Lombard architecture, which inspired the cathedrals of Parma (PL. 171), Piacenza, Cremona, and Ferrara, and the Church of S. Zeno in Verona. In the field of secular architecture the type of town hall featuring an open gallery on the ground floor became widespread; thus, the *broletti*, or Courts of Justice in Milan, Pavia, Monza, and Brescia, the Palazzo dell'Arengo in Rimini (PL. 187), and the Palazzo della Ragione at Bergamo.

Lombard sculpture of this period was closely bound to the general development of European Romanesque style because of the activity of Wiligelmo da Modena and Benedetto Antelami (qq.v.). In the first half of the 12th century the sculptural style of Wiligelmo da Modena (influenced by the art of Aquitaine and Burgundy) spread from Modena to Cremona, Nonantola, Ferrara, Verona (Nicolaus, q.v.), and even into Apulia. In the late 12th and early 13th centuries, the style of the school of Antelami (influenced by Provençal art) was carried by the Campionesi (q.v.) throughout the Po Valley (Milan, Piacenza, Modena, Parma, Ferrara, Venice) into Tuscany (Lucca, Pisa, Pistoia), and even to Sicily. In the 14th century the influence of Giovanni Pisano appeared in Milan through the activity of his pupil Giovanni di Balduccio (VI, PL. 367), who introduced the Gothic idiom to the circle of the Campionesi. Lombard works of this period are characterized by a style that combines late Gothic taste with a Renaissance exuberance of ornament.

The Cathedral of Milan (FIG. 379; VI, PL. 337), the Certosa of Pavia, and the cathedrals of Monza and Como (PL. 187) — all of which benefited from the patronage of Gian Galeazzo Visconti — reflect a continuity of taste, even while style was changing. French, Italian, and German architects succeeded one another in the workshop of the Cathedral of Milan, founded in 1386, and it is to these men that the Cathedral owes its pronounced late Gothic stamp, which was also reflected in the Cathedral's sculpture (e.g., Giovanni di Fernach's decoration over the South Sacristy door, PL. 187). The work of these foreign architects influenced such local artists as Giovannino de' Grassi, Matteo de' Raverti, and Jacopino da Tradate. The bizarre imagination of the Tuscan architect and theorist Filarete (q.v.) easily assimilated Gothicizing elements (Milan, the Ospedale Maggiore and the façade of the Castello Sforzesco). Michelozzo (q.v.) successfully introduced the style of Brunelleschi in Milan, but his portal to the Medici bank (now in the Castello Sforzesco) was executed by local craftsmen in accordance with the traditional taste for excessive decoration. His Portinari Chapel in S. Eustorgio, however, is a masterpiece of the new style of architecture and decoration. The works of Giovanni Antonio Amadeo, architect and sculptor of the Cappella Colleoni in Bergamo (ca. 1475) and the Certosa of Pavia (PL. 195), are fine examples of Lombard taste for a picturesque type of decoration that maintained late Gothic traditions in classicistic guise. Guiniforte and Pietro Solari (both active at the Certosa of Pavia), Giovanni Battaggio (Church of the Incoronata, Lodi), Dolcebuono, and Agostino dei Fonduti are the other principal representatives of this tendency; they were somewhat aware of the monumentality of Bramante's work. The Renaissance movement gained full acceptance after Bramante's arrival in Lombardy. In fact Cristoforo Solari (dome of the Church of S. Maria della Passione, Milan) and Bartolommeo Suardi, called "Bramantino" (Trivulzio burial chapel, S. Nazaro Maggiore, Milan 1518), took as their starting point the works of Bramante.

In addition to Giovanni Antonio Amadeo — whose Paduan Renaissance preparation found beautiful expression in the tomb for Medea Colleoni in Bergamo — it was chiefly the Mantegazzas (Certosa of Pavia, PL. 195) and the Rodaris (Cathedral of Como), who in fine sculptures exhibited the lingering Lombard attachment to the Gothic style. More flexible in their feeling for classic plasticity were Benedetto Briosco (also active in Pavia), Cristoforo Caradosso (a renowned goldsmith), and the previously mentioned Agostino dei Fonduti (who provided terra-cotta decoration for Bramante's sacristy of S. Maria presso S. Satiro in Milan). Agostino Busti, called "Bambaja," continued the traditional Lombard taste in decoration into the 16th century.

In painting, after the execution of the early medieval fresco cycle at Castelseprio by an itinerant Byzantine master (II, PL. 445), fresco cycles at Galliano (ca. 1007) and in S. Pietro al Monte in Civate (12th century) reveal the confluence in Lombard art of Byzantine and transalpine styles. Some scholars attribute the severe modeling of the 13th-century frescoes of the Baptistery of Parma to Lombard and Po Valley sources. The 14th-century frescoes in the fortress at Angera are among the earliest examples of secular painting. The contemporaneous frescoes of the apse of the Church of S. Abbondio in Como still bore the imprint of local style. The influence of Giotto, who had been called to Milan by Azzone Visconti, made itself felt in the mid-14th century in the crossing-tower frescoes of the Abbey Church of Viboldone (1349), attributed to the Florentine Giusto de' Menabuoi. Other frescoes of later date in the same abbey evidence an acquaintance with the art of Giovanni da Milano (active previously in Florence), and these, together with frescoes in Solaro, the Oratory of Mocchirolo, in Brianza (IV, PL. 203), and Lentate, express that intimate and secular mode of poetic feeling that was characteristic of northern Italian painting, a mode that was in accord with the naturalism and painterly softness of the International Gothic style. Lombardy made important contributions to International Gothic through the illuminated manuscripts, which, under the name of "ouvraige de Lombardie," were widely diffused throughout Europe, and through the work of such Lombard artists as Giovannino de' Grassi (III, PL. 9; VI, PL. 371), Michelino da Besozzo (PL. 188), Belbello da Pavia (VI, 386), the Zavattaris in Monza, and Bonifacio and Benedetto Bembo in Cremona. The presence of Gentile da Fabriano and Jacopo Bellini in Brescia, of Pisanello in the Castello of Pavia, and of Masolino in the Collegiate Church and Baptistery of Castiglione Olona (IX, PLS. 375, 376) mark three important chapters in the history of Lombard art within the sphere of the International Gothic style.

Vincenzo Foppa (q.v.) of Brescia, the first Lombard Renaissance painter, emerged from the circle of the Bembos. Foppa's influence, together with Paduan influences and an almost naïve love of color, is evident in the works of Bernardino Jacobi Butinone (e.g., the altarpiece in Treviglio, painted in collaboration with Bernardino Zenale, ca. 1485) and Il Bergognone (Ambrogio da Fossano; PL. 196). The soft, luminous plasticity characteristic of Lombard painting was predestined to converge with the style of Leonardo da Vinci (q.v.). A good number of artists formed a group about Leonardo and assumed the uniform character of a school. Andrea Solari, though of Venetian background, was allied to this group (*The Virgin with the Green Cushion*, PL. 211), whose chief representatives were Ambrogio de Predis (wings of *Virgin of the Rocks*, London, Nat. Gall.) and Giovanni Antonio Boltraffio (PL. 196). Less important members of this group were Francesco Melzi, Giovanni Pedrini, called "Giampietrino," Marco d'Oggiono, and Cesare da Sesto (later active in southern Italy). Bernardino Luini was more an artist of the 15th century. A painter of the sweet and intimate, he is well represented by the frescoes from the Villa della Pelucca in Monza and by the *Madonna of the Rose Garden* (Milan, Brera). Both Luini and Vincenzo Civerchio (known as Fanone) oscillated between the manner of Foppa and that of Leonardo.

The painting of Bartolomeo Suardi (known as Bramantino, q.v.), reflects the monumentality of Bramante's art. Bramantino's dramatically energetic mode of representation stems from the school of Ferrara (*Nativity*, PL. 196; *Crucifixion*, Milan, Brera). Gaudenzio Ferrari, an artist of great originality, developed an unconventional and dramatic style that gave rise to ambitious decorative complexes (Church of S. Gaudenzio, Varallo; the Church of S. Cristoforo, Vercelli; the dome of the Sanctuary of the Madonna dei Miracoli, Saronno).

Moreover, in the 16th century, important local schools were formed in such towns as Brescia, Bergamo, and Cremona. Bergamo, whose school was dominated by Palma Vecchio, remained closely linked to Venice. The school of Brescia, although it had its origin in the revolutionary art of Giorgione, was bound to the luminous naturalism of Lombard painting of the tradition of Foppa and Leonardo. This is especially evident in the work of G. G. Savoldo (PL. 216; *St. Matthew*, Met. Mus.). Savoldo's night scenes, with their cold, crystalline lights, influenced Il Romanino (Girolamo Romani; PL. 216), a painter who worked in a rather Venetian style, and provided Alessandro Bonvicino (called Moretto da Brescia; PL. 216) with those low-keyed silvery tones that characterize the poetic realism of his altarpieces (*Nativity*, Brescia, Pin. Civ. Tosio Martinengo) and numerous portraits. Portraits were also a specialty of the more crudely incisive Giambattista Moroni (q.v.) of Bergamo, who was a pupil of Moretto.

The major artists of Cremona at this time were Boccaccio Boccaccino and the Campis (VI, PL. 69; IX, PL. 302); Lodi's chief artists were the Piazzas.

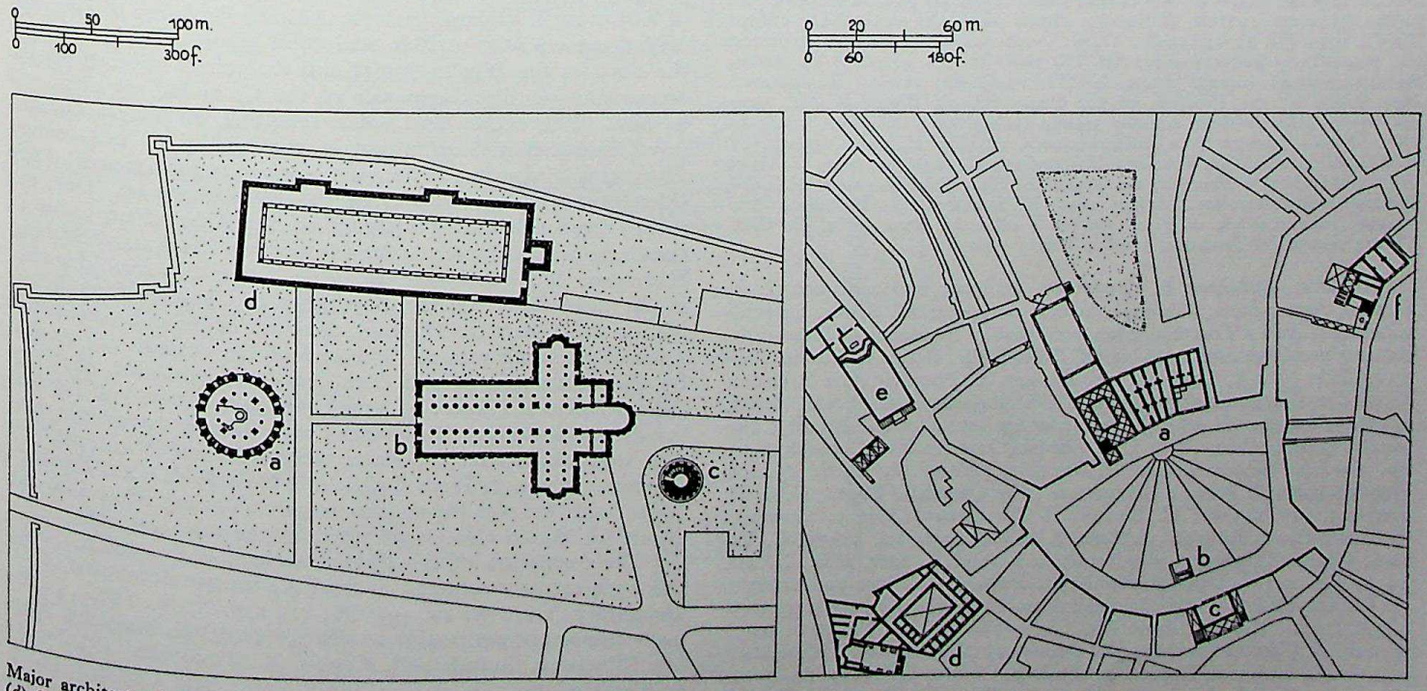
Badt, Andrea Solario, Leipzig, 1914; K. T. Parker, Andrea Solario: Head of the Virgin, Old Master Drawings, X, 1935, pp. 44–45). *Cristoforo Solari*: Milan, ca. 1460–1527, sculptor and architect (W. R. Valentiner, A Madonna by Cristoforo Solari, B. Detroit Inst. of Arts, XXI, 1941–42, pp. 18–20). *Zavattari*: family of painters, active in Lombardy 1404–79 (P. D'Ancona, Antichi pittori lombardi, Dedalo, IV, 1923–24, pp. 361–80; R. Longhi, Per un polittico lombardo di Castel Sant'Angelo, Paragone, VIII, 87, 1957, pp. 45–47).

THE PISAN SCHOOL AND ITS SPHERE OF INFLUENCE. During the period when Pisa ranked high among the leading seafaring republics of the Italian peninsula, a distinctive Pisan school of art, whose activity encompassed the Romanesque and the early Gothic period, also flourished. Architecture was one of the most important manifestations of the Italian Romanesque, and Pisa's example was widely and strongly influential not only in such Tuscan centers as Lucca and Pistoia but also in Sardinia, Corsica, and Apulia. The Cathedral of Pisa (FIG. 385) is a fundamental monument of the Italian Romanesque. Begun by Busketus (Buscheto) in 1063 and consecrated while still incomplete in 1118, it has a Latin-cross plan with five aisles and an elliptical dome. Lombard elements (exterior galleries, galleries over the aisles), Islamic elements (the high impost blocks of the arches), and Armenian elements (the blind arcades with lozenge decoration) are all fused in a classic whole in which the aisle colonnades recall Early Christian basilicas. The façade, which features the use of arcaded galleries, was added later by Rainaldo. The Baptistery (begun by Diotisalvi in 1153) and the Campanile (the work of Bonannus, 1173) also have arcaded galleries, a feature that remained typical of Pisan architecture until the 14th century.

The influence of Lombard Romanesque art was felt early in Pisan sculpture. Guglielmo's pulpit for the Cathedral of Pisa (PL. 181) evidences this influence mingled with elements derived from Roman sarcophagi. Similar cases are the modest works of Gruamons (Pistoia) and Biduinus (Lucca). Pisa had another great sculptor, one capable of dramatizing expressionistically certain Byzantine elements; this was Bonannus, mentioned above, the creator of the city's Campanile. He also executed the bronze doors of the Cathedral. The principal door (1179) was destroyed by fire in the 16th century; the one that remains, the Porta di S. Ranieri (IX, PL. 508), is considered later in date than Bonannus' door at Monreale (III, PL. 12).

In Lucca the architecture of the oldest churches (S. Alessandro, S. Frediano) registers in forms of great clarity the early and direct influence of Lombard work. It was this influence that dictated the more emphatic plasticity with which Lucca interpreted Pisan forms [e.g., the façade of the Cathedral (S. Mar-



Major architectural complexes in Pisa and Siena, plans. *Left*: Pisa, Piazza del Duomo: (*a*) Baptistery; (*b*) Cathedral; (*c*) Campanile ("Leaning Tower"); (*d*) Camposanto. *Right*: Siena, Piazza del Campo and vicinity: (*a*) Palazzo Pubblico (*b*) Fonte Gaia; (*c*) Loggia della Mercanzia; (*d*) S. tino), by Guidetto, 1204; PL. 178]. The decoration of the Cathedral demonstrates the continuity of Lombard influence, both in the sculpture (ca. 1240) by Guido Bigarelli da Como (who also worked in Pisa and Pistoia; PL. 82; III, PL. 19) and in the scenes from the lives of SS. Regulus and Martin by a sculptor of the school of Antelami (PL. 181). In the first half of the 13th century in Lucca even painting was in the hands of a Lombard family, the Berlinghieri.

Pistoia added coloristic emphasis to the Pisan style of architecture in the use of thick bands of bichromatic revetment, to the detriment of the rhythmic clarity of the arcades (S. Giovanni Fuorcivitas, PL. 178). In Arezzo, Lombard and Pisan elements mingled in the Pieve di S. Maria (PL. 182; I, PL. 388).

In the second half of the 13th century Pisa emerged as the focal point of Italian sculpture, because of the work of Nicola Pisano and his son Giovanni (qq.v.) and the sculptor-architects who were trained by them. Giovanni made Siena another important center of his influence. Arnolfo di Cambio (q.v.), Guglielmo, and Lapo were active in Bologna and Rome. Arnolfo's name, however, is primarily associated with Florence. Andrea da Pontedera (q.v.), also called Andrea Pisano, is another Pisan artist known especially for his contribution to Florentine art. The influence of the refined Gothicism of Nino Pisano, Andrea's son, was felt as far away as Venice and Sicily, while Giovanni di Balduccio (VI, PL. 367) carried Pisan influence to Milan.

Pisa was of less importance in painting. Its painted crosses, including those of Giunta Pisano (active 1229–54), are full of Byzantine elements (PL. 179). The Master of S. Martino, perhaps to be identified with Ranieri di Ugolino, a member of the Tedice family, ranks alongside Cimabue and Duccio di Buoninsegna (qq.v.) with his Virgin and Child and stories of the Virgin (PL. 181). In the succeeding century, Pisan painting strongly felt Sienese (Simone Martini) and Florentine influences (Andrea Orcagna). Bolognese influence is also evident in the decoration of the Camposanto, for example, in the *Triumph of Death* (IV, PL. 468; VI, PL. 379), attributed to Francesco Traini (PL. 183).

Meiss, A "Madonna" by Francesco Traini, GBA, LVI, 1960, pp. 49–56).

FLORENTINE ART FROM THE ROMANESQUE PERIOD TO THE RENAISSANCE. A sense of clarity and balance in structure and decoration characterizes the Florentine Romanesque, and the over-all impression is one of classic measure. Consonant with this impression is the fact that, while most authorities date the octagonal Baptistery of Florence (I, PL. 302) to the 11th century, others attribute it to the 5th century. The inlay decoration of white and green marble is a typical feature (e.g., the Baptistery, PL. 182; S. Miniato al Monte, the façade of the Badia in Fiesole, III, PL. 388; and of the Collegiate Church in Empoli), one that persisted even in the city's Gothic Cathedral (S. Maria del Fiore; X, PL. 295). The 11th-century Church of SS. Apostoli served the architects of the Renaissance as a model (PL. 182).

The architecture of the Gothic period also exhibits sensitively calculated proportions, and the tension, strength, and clarity of its constructions attests to the logical continuity of the development of Florentine architecture from the 11th century to the Renaissance. Works begun toward the end of the 13th century include the Church of S. Maria Novella, a Dominican church (begun ca. 1278 and completed ca. 1360), by Jacopo Talenti. (The façade was added by Leon Battista Alberti; I, PL. 53.) Other Florentine structures begun at that time include Sta Trinita (Vallombrosan church, attributed by some to Nicola Pisano), Sta Croce (Franciscan church, begun 1252, and attributed to Arnolfo di Cambio; renewed at various times from 1295 on), the Cathedral (S. Maria del Fiore, started in 1296 after a plan by Arnolfo), the Palazzo del Podestà, or Bargello (PL. 184), and the Palazzo Vecchio, or Palazzo della Signoria (I, PL. 396; VI, PL. 339). Succeeding one another as chief architects of the Cathedral were Giotto, Andrea da Pontedera, and Francesco Talenti (the latter after 1351). Talenti's son, Simone, worked with Benci di Cione Dami on the Loggia della Signoria (1376–81) and on Orsanmichele, where Neri de Fioravante (who also did work in the Palazzo del Podestà) had previously worked.

In sculpture Florence turned, after Arnolfo's death, to Pisa and Siena for its artists. Andrea da Pontedera (q.v.) dominated Florentine sculpture for almost twenty years. With Andrea's art as their basis, Giovanni and Pacio da Firenze worked (beginning in 1343) in Naples on the richly ornate tomb of Robert of Anjou in S. Chiara. Alberto Arnoldi, probably of Lombard origin, carved with archaic sculptural vigor. The lunette over the door to the Bigallo (1361) and the reliefs representing the sacraments on the Campanile of the Cathedral are attributed to him. The ornate and noble sculpture of Andrea Orcagna (q.v.) initiated a third phase in the history of 14th-century Florentine sculpture. The most important monuments of this third phase are two works of the goldsmith's art. One, the scenes from the Old Testament on the Altar of St. James in the Cathedral of Pistoia, is the work of two followers of Orcagna, Francesco di Niccolò and Leonardo di Ser Giovanni; the other is the altar done for the Baptistery of Florence (now in the Museo dell'Opera del Duomo), the work of the afore-mentioned Leonardo among others. The end of the century was marked by the decoration of the Cathedral — in particular, the Porta della Mandorla (begun in 1391), which marks a link between pre-Renaissance and Renaissance art. Among the various masters who worked on the Porta were Giovanni d'Ambrogio da Firenze, Jacopo di Piero Guidi, and Niccolò di Piero Lamberti (who, with his son Piero, later went to Venice); Donatello and Nanni di Banco also participated in the work (PL. 184).

The formation of the Florentine school of painters during the 13th century centered around the mosaic decoration of the Baptistery (III, PLS. 12, 490; IV, PL. 177; X, PL. 188). All the early important personalities were involved; the Magdalen Master (Florence, Accademia), Coppo di Marcovaldo (Madonnas in Orvieto, PL. 183, and in Siena, 1261), and Cimabue (q.v.). Through the activity of Giotto (q.v.) and his followers, the hegemony of Florence in 14th-century Italian painting was assured. Some of Giotto's many collaborators and pupils have

remained anonymous, such as the Master of S. Cecilia (PL. 183; three scenes from the life of St. Francis, in Assisi), the Painter of the Franciscan Vows, and the Master of the Chapel of the Magdalen (last two, active in the Lower Church of S. Francesco in Assisi). The modest Pacino di Buonaguida is known for a polyptych of about 1315 (Florence, Accademia). Other followers of Giotto who have been identified with more or less certainty are Maso di Banco (q.v.) and Maestro Stefano (VI, PL. 347). The latter's delicate chiaroscuro fusion of light and color was far ahead of its time. The work of Stefano's son, Giottino (VI, PL. 348), is related to northern Italy. Giovanni da Milano brought to Florence the naturalistic pathos of his native Lombardy (IV, PL. 269; VI, PLS. 62, 362). Sienese influences, which had affected the art of Bernardo Daddi (q.v.),

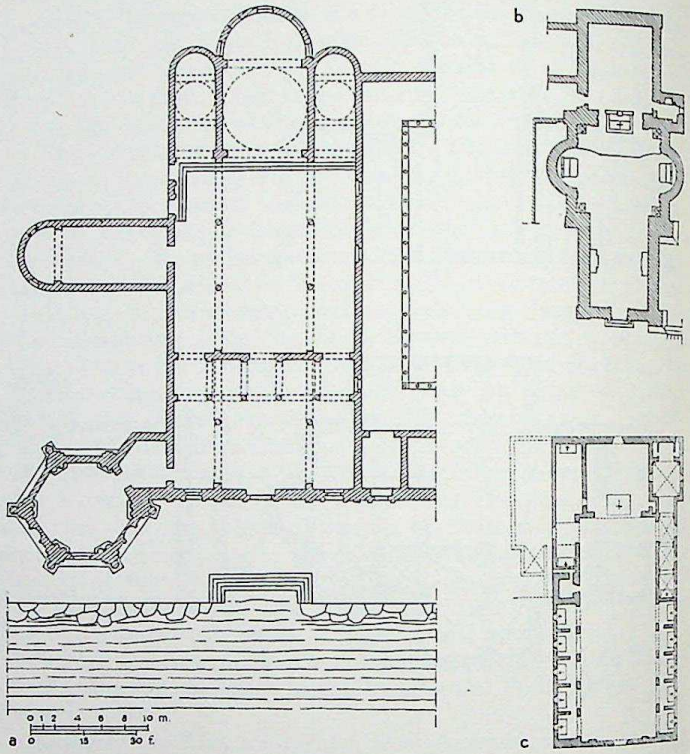
mingled with other elements in Florentine painting of the time. A long-time follower of Giotto, Taddeo Gaddi was also attracted by the Sienese manner of narrative description (PL. 183). Shortly after the middle of the 14th century, Florentine art fell under the spell of Andrea Orcagna (q.v.), who, in a sense, resumed the monumentality of Maso. Yet Andrea's brother, Nardo di Cione, was apparently attracted by the refined subtleties of color and modeling that are characteristic of Stefano (the Strozzi Chapel in S. Maria Novella). Giusto de' Menabuoi, who was active in Padua, worked in a vein allied to the style of northern Italy. In the work of Andrea da Firenze (Andrea di Bonajuto, or Andrea Bonaiuti) Sienese influence resulted in a kind of calligraphic art (II, PL. 364; III, PL. 314). Spinello Aretino, on the other hand, was a narrative artist whose breadth and ease are apparent in his many frescoes in S. Miniato al Monte, in the Camposanto in Pisa, and in the Palazzo Pubblico in Siena (VII, PL. 272). The illustrative art of Agnolo Gaddi reflected, at this early date, the International Gothic style (e.g., frescoes in the choir of Sta Croce, VI, PL. 380; and in Prato Cathedral). Gherardo Starnina probably worked with Gaddi in Sta Croce and was also active in Spain. The ascetic art of Lorenzo Monaco (q.v.) marked the end of 14th-century painting in Florence, while the gentle worldliness of the art of Masolino (q.v.) carried the spirit of the International Gothic style, scarcely affected by the spirit of the new era, well into the 15th century.

The spirit of 15th-century Florentine civilization, described by Vasari and succeeding historians as a "rebirth" or "renaissance" (q.v.), showed the most extraordinary vitality and capacity for expansion. Brunelleschi (q.v.) and, immediately after him, Alberti (q.v.), established the principal foundations of the new architecture. The former architect was more Tuscan in background and expression, the latter more Roman and universal. A follower of Brunelleschi was Cosimo de' Medici's architect, Michelozzo (q.v.; e.g., the Monastery of S. Marco; the Palazzo Medici-Riccardi; the Medici villas of Careggi and Cafaggiolo; the Church of S. Agostino in Montepulciano, PL. 191). Michelozzo is important for his part in the creation of the typical *palazzo* of rich Florentines of the Renaissance, a building type that still marks an essential part of the city's appearance. Bernardo Rossellino (q.v.), a follower of Alberti, is chiefly known for the buildings he constructed in the Piazza di Pio II in Pienza for Pope Pius II. The Palazzo Venezia in Rome has been attributed to Rossellino. Also influenced by Alberti was the architect and sculptor Agostino di Duccio, whose works in Perugia are noteworthy examples of architecture richly adorned with sculpture (the façade of the Oratory of S. Bernardino, PL. 191; and the Porta di S. Pietro). Originally a woodcarver, the architect Giuliano da Maiano worked in Arezzo, Siena (Palazzo Spannocchi, 1473), Faenza (Cathedral), and Naples, as well as in Florence. Together with his brother Benedetto and Simone del Pollaiuolo (known as Il Cronaca), Giuliano da Maiano established the direction of civic architecture in the period after Michelozzo, bringing it to the threshold of the 16th century. Benedetto was the architect of the Palazzo Strozzi (1490) in Florence and of the loggia of S. Maria delle Grazie in Arezzo (PL. 191); Il Cronaca completed the Palazzo Strozzi and was the architect of the Church of S. Salvatore al Monte (PL. 191; FIG. 392), the Palazzo Horne and the Palazzo Guadagni in Florence. The history of 15th-century Florentine architecture closes with the work of Giuliano and Antonio da Sangallo the Elder (q.v.). The former summed up in subtle elegance the achievements of the past, while the latter, through the influence of Bramante and Raphael, participated in the vital currents of the new art of the 16th century.

Several Florentine sculptors of the so-called "transitional phase" were influential in the Veneto. Among them were Niccolò di Piero Lamberti and his son Piero, and Nanni di Bartolo, known as Il Rosso. (See below, *Venetian art from the Romanesque period to the 16th century.*) Contemporaneously in Florence Nanni di Banco conceived his figures, at least potentially, as ancient Romans, though he continued to drape them in the Gothic manner (e.g., *The Four Crowned Saints*, III, PL. 391). By this time, however, Florentine sculpture was dominated by Lorenzo Ghiberti and Donatello (qq.v.), whose strong personalities affected in various ways almost all the artists of Florence throughout the century. Many of the artists already mentioned as architects also worked as sculptors (PL. 192). Michelozzo collaborated with Donatello (1423–33) in tombs for the antipope John XXIII (III, PL. 13) and Cardinal Brancacci (Naples, S. Angelo a Nilo). Bernardo Rossellino happily united the arts of architecture and sculpture in his tomb for Leonardo Bruni (1444–51, Florence, Sta Croce), the monument that established the characteristic form of the Renaissance tomb for the entire 15th century. It was used as a model by Desiderio da Settignano (q.v.) in his tomb for Carlo Marsuppini (Florence,



Churches, second half of 15th cent., plans. (*a*) Island of San Michele (near Venice), S. Michele; (*b*) Urbino, S. Bernardino degli Zoccolanti; (*c*) Florence, S. Salvatore al Monte.

Sta Croce) and by Antonio Rossellino in his tomb for the Cardinal of Portugal (Florence, S. Miniato al Monte). In the hands of these artists the pictorial values introduced into sculpture by Donatello took on exquisite refinement, both in *stiacciato* reliefs and in free-standing works. Examples of this refinement are Desiderio's reliefs of the Madonna and Child and his portrait busts of women (Turin, Gall. Sabauda; Florence, Mus. Naz.; Berlin, Staat. Mus.), as well as several reliefs by Antonio Rossellino representing the Madonna and Child, the Infant St. John, and St. Sebastian (Empoli, Gall. della Collegiata), and works in the Piccolomini Chapel of the Church of Monte Oliveto (S. Anna dei Lombardi) in Naples. Mino da Fiesole (q.v.), also active in Rome, worked the lyric vein of Desiderio, sometimes in a mannered, academic fashion (PL. 192). Agostino di Duccio, on the other hand, by accentuating the linear aspect of the *stiacciato* relief technique, attained an imaginative elegance (the decoration of the Tempio Malatestiano in Rimini and of the Oratory of S. Bernardino in Perugia, PL. 191). Together with Antonio Rossellino, Benedetto da Maiano represented a trend toward extreme naturalism in Florentine portraiture, as, for example, in his busts of Pietro Mellini (1474, Florence, Mus. Naz.) and Filippo Strozzi (Louvre). In his pulpit for Sta Croce (Florence, 1472–75), in the shrine of S. Savino (Faenza, Cathedral), and in his altar relief of the Annunciation (1489, Naples, Church of Monte Oliveto) Benedetto showed himself a decorator of great skill. The noble and serenely idealistic art of Luca Della Robbia (q.v.), which was rooted in the tradition of Ghiberti, declined in the work of Luca's followers, through excessive emphasis on naturalistic elements.

But the influence of Donatello was operative in the second half of the 15th century in the well-conceived and original sculpture of Antonio Pollaiuolo and Verrocchio (qq.v.).

Florentine painting of the 15th century embodied the very concept of the Renaissance (q.v.). The name of Masaccio (q.v.) signalizes the decisive turning point of this period. Yet the new style was affirmed in a whole series of original personalities — Fra Angelico, Paolo Uccello, Filippo Lippi, Domenico Veneziano, and Andrea del Castagno (qq.v.), whose works extended in time over the first half of the 15th century and beyond. In the subtly poetic art of Pesellino (Francesco di Stefano), the tradition formed by the above-mentioned artists was adapted to narrative and genre representation (PL. 193). Deriving principally from Lippi and Angelico, Pesellino was a fine painter of small figures on predellas and *cassoni* (Uffizi; London, Nat. Gall.; Boston, Isabella Stewart Gardner Mus.). Similarly Benozzo Gozzoli (q.v.) based his style upon that of Fra Angelico, with whom he had collaborated in Florence, Orvieto, and Rome. Gozzoli imbued his narrative scenes, which were conceived in a late Gothic spirit, with a special kind of circumstantial realism (e.g., work in Montefalco, S. Francesco, 1452; Florence, Palazzo Medici-Riccardi, PL. 193; San Gimignano, S. Agostino, 1465; Pisa, Camposanto, 1468–84). The subtler, more restless spirit of Alesso Baldovinetti (q.v.) was sensitive to a particular kind of dynamic linearism (PL. 194; Florence, the courtyard of SS. Annunziata, S. Miniato al Monte, and Sta Trinita; Louvre). This dynamic linearism was to become a basic element in the work of Florentine painters of the second half of the century, especially in that of Pollaiuolo, Verrocchio, and Botticelli (qq.v.), who influenced other artists active in this period. The influence of these masters was often supplemented by interest in Flemish painting, which enjoyed great prestige in Italy. Domenico Ghirlandajo (q.v.), the head of a successful workshop, occupied a position of special importance as a narrative artist. Cosimo Rosselli at times attained a pleasing descriptiveness that compensated for his poverty of imagination (Rome, three frescoes in the Sistine Chapel, 1482; Florence, S. Ambrogio, ca. 1485). Jacopo del Sellaio, a *cassoni* painter, was a pleasing decorator and pictorial narrator. Of more elevated poetic temperament were Filippino Lippi and especially Piero di Cosimo (qq.v.). Piero, sensitive to the many influences prevalent in his time, was a fascinating and original interpreter of myth and allegory (New York, Met. Mus.; London, Nat. Gall., PL. 211; Cambridge, Mass., Fogg Art Mus.; Uffizi, PL. 194). Incisive and poetic in his figure pieces (St. Mary Magdalene, Rome, Gall. Naz.), Piero di Cosimo also excelled as a portrait painter (of Simonetta Vespucci, Chantilly, Mus. Condé; Francesco Giamberti and Giuliano da Sangallo, The Hague, Mauritshuis). The problematical Raffaellino del Garbo was closely related to Filippino Lippi. Lorenzo di Credi, who seems to have been allied most closely to Andrea del Verrocchio, crystalized that master's vibrant chiaroscuro in craftsmanship of an almost porcelain finish. Lorenzo was also influenced by Perugino (Uffizi, PL. 194; Pistoia, Mus. Civ. and Baptistery).

THE SIENESE SCHOOL. The predominantly Lombard character of Romanesque architecture in the region of Siena is revealed

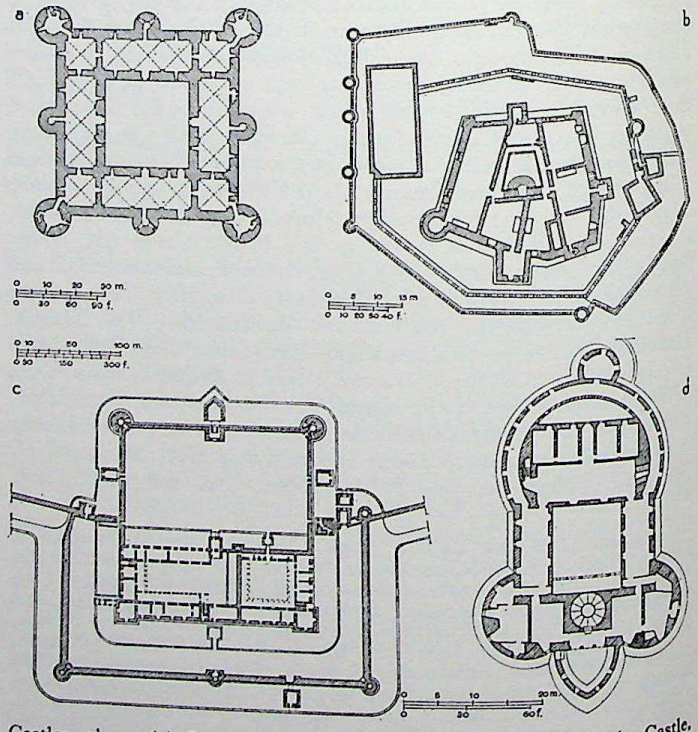
UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

by the oldest remaining parts of the Cathedral of Siena and, even more, by the simple, rustic parish churches of the surrounding countryside. During the Gothic period, building in Siena was generally characterized by a less organic, less rational sense of structure than in Florence. In particular, Sienese architecture was marked by more attenuated forms that achieved a linear, somewhat ornate delimitation of space. The workshops of the Cathedral, in which Giovanni Pisano was the dominant personality, provided the training ground for a long line of Sienese sculptor-architects, up to Giovanni di Cecco, who in 1377 created the crowning portion of the Cathedral façade. The Gothic aspect of the city, in which secular architecture occupies an important part (with its characteristic Sienese arch, consisting of a segmental arch surmounted by an ogival one), had already been established in large part prior to the terrible plague of 1348. Among Siena's Gothic structures are the city's monumental fountains, the city gates, the public and private *palazzi*, the Franciscan, Dominican, Carmelite, Servite, and Augustinian churches, and the magnificent, but incomplete, New Cathedral. It was for the building of the New Cathedral that Lando di Pietro was summoned back to Siena from Naples in 1339. Upon Lando's death, a year later, construction was entrusted to Giovanni di Agostino (PL. 184). Perhaps the greatest masterpiece of Sienese Gothic architecture, however, is the façade of Orvieto Cathedral (VI, PL. 333), of which the Sienese Lorenzo Maitani (q.v.) was master of works from 1310 to 1330.

Solid plastic masses and broad linear rhythms characterize the art of Tino di Camaino (q.v.; VI, PL. 365), the most monumental of Sienese sculptors, who worked in Pisa, Florence, and Naples, as well as in his native city. Gano da Siena (Galgano di Giovanni) carved the solemn portrait of Ranieri del Porrina (Casole d'Elsa), and Goro di Gregorio (VI, PL. 365) executed small bas-reliefs, soft and evanescent, for the Arca di S. Cerbone (Massa Marittima, Cathedral, 1324) and the tomb of Guidotto De Tabiatis (Messina, Cathedral, 1333). Less fine but vigorously descriptive are the small narrative scenes carved by Agostino di Giovanni and Agnolo di Ventura as part of the tomb of Bishop Tarlati in Arezzo Cathedral (1330). Because of their refined handling of linear elements and incisively pictorial qualities, a series of reliefs on the exterior piers of Orvieto Cathedral have been attributed to Lorenzo Maitani or Ramo di Paganello (IX, PL. 265). The first Sienese painter of the 13th century known to us by name is Guido da Siena (*Madonna and Child Enthroned*, PL. 185). Yet there are anonymous works of even finer quality (e.g., the altarpieces of St. John and St. Peter, Siena, Pin.). But it was Duccio di Buoninsegna (q.v.) who initiated the brilliant course of Sienese Gothic painting, which was influential throughout Europe, from Spain to Bohemia, especially through the activity of Simone Martini (q.v.). Through the work of Ambrogio and Pietro Lorenzetti (q.v.), the sumptuous color of Sienese painting and its characteristically poetic mode of narration even influenced Florentine art. Among the more immediate followers of Duccio were Segna di Bonaventura and Ugolino da Siena (di Neri or Nerio; PL. 185). Lippo Memmi (PL. 185) and the more important Barna da Siena (VI, PL. 379; frescoes in San Gimignano, Collegiate Church) were both active within Simone's circle, while Lippo Vanni and Niccolò di Ser Sozzo Tegliacci (chiefly known as an illuminator) were more closely related to the Lorenzettis. The goldsmith's art was also of great importance in this period. Both Lando di Pietro, an architect and sculptor, and Ugolino di Vieri (q.v.; VI, PL. 382) were famous goldsmiths.

In comparison with this vital first period, the second half of the 14th century was a time of narrow provincialism for Sienese art. A decorative painter such as Bartolo di Fredi, for example, squandered the wealth of his artistic inheritance pleasantly enough without, however, creating anything new. Through the activity of such minor masters as the productive Luca di Tommè, Sienese painting vegetated, exerting influence only on such lesser centers as Pisa and southern Italy. With the work of Paolo di Giovanni Fei (PL. 98), minor artists continued their activity into the 15th century. Meanwhile painters of a substantially higher category appeared. One was Stefano di Giovanni, known as Sassetta (q.v.), a master who vacillated between the spirit of the International Gothic style and the spirit of the Renaissance, yet was entirely at one poetically with the former style (small narrative scenes from the altarpiece for the Arte della Lana, Siena, Pin., and elsewhere; the altarpiece of Our Lady of the Snows, Florence, Contini Bonacossi Coll.; an altarpiece for Sansepolcro, panels of which are in Settignano, Berenson Foundation, London, Nat. Gall., and elsewhere). Another such master was Giovanni di Paolo (q.v.), an artist totally immersed in his own introverted fantasies, which gave his work its characteristic strong lyrical accent and a kind of dramatic asceticism (VI, PL. 381; Siena, Pin.). The saccharine creations of Sano di Pietro (Ansano di Pietro di Mencio) represented a vulgarization of the poetry of Sassetta. Domenico di Bartolo (PL. 202), instead, accepted the discoveries of the Renaissance, and in his Madonna of 1433 (Siena, Pin.) he came close to Filippo Lippi. Lorenzo di Pietro, known as Il Vecchietta, also assimilated the lessons of Florentine art, though his style always remained predominantly Sienese (*Assumption*, 1461, Pienza, Cathedral). As a sculptor, Il Vecchietta was strongly influenced by Donatello (PL. 202; ciborium, Siena, Cathedral). He thus made a decisive break with the lingering tradition of Jacopo Della Quercia (q.v.), which had inspired the serenely harmonious art of Francesco da Valdambrino as well as the crudely classicizing manner of Antonio Federighi (di Federigo) dei Tolomei. Two pupils of Il Vecchietta were Neroccio di Bartolomeo di Benedetto de' Landi, a painter whose art provides a quintessential example of traditional Sienese sensitivity in a new, 15th-century manner (Madonnas, Siena, Pin.), and Francesco di Giorgio (q.v., PL. 202), a painter and sculptor in contact with contemporary Florentine art and, at the same time, a civil and military architect (works in Urbino, Palazzo Ducale; Church of the Madonna del Calcinaio, near Cortona; San Leo, fortress; Sassocorvaro, fortress, FIG. 396). Another pupil of Il Vecchietta was the sculptor



Castles, plans. (*a*) Catania, Castello Ursino, begun 1237; (*b*) Fénis, Castle, begun 1330; (*c*) Milan, Castello Sforzesco, rebuilt 1450 (plan after L. Beltrami); (*d*) Sassocorvaro, Castle, begun second half of 15th cent.

Giacomo Cozzarelli, who worked in terra cotta. Matteo di Giovanni (PL. 202), whose eclecticism amalgamated Sienese and Florentine influences as well as elements deriving from the work of northern European illuminators, represents the last valid compromise made by Sienese painting with the art of the Renaissance. For at this time the Umbrians Perugino and Pinturicchio were summoned to Siena. Another newcomer was

Giovanni Antonio de' Bazzi from Vercello, known as Sodoma (q.v.). His basically Lombard and Piedmontese preparation filtered through the work of Leonardo and Raphael (Sodoma's frescoes in the Abbey of Monte Oliveto Maggiore, outside Siena; and in Rome, Farnesina) and exerted a strong influence upon Sienese painting from 1501 on. A noble product of this encounter of influences was the art of Domenico Beccafumi (PL. 86; IX, PL. 295).

Ragghianti, Vecchietta scultore, CrArte, N.S., I, 1954, pp. 330–35).

CENTRAL AND SOUTHERN ITALIAN ART TO THE 15TH CENTURY: *Southern Italy*. The dominant elements of the Romanesque art of southern Italy were Byzantine, Arabic, and Norman. In Apulia, however, Lombard and occasional Pisan forms exerted a certain influence. Examples of more traditional Byzantine architecture (with a plan in the form of a Greek cross inscribed within a square) have survived in Calabria (Rossano; Stilo, FIG. 399) and Apulia (Otranto; Trani, PL. 172; Canosa di Puglia). The remains of S. Maria della Roccella in Catanzaro Marina (11th cent.) as well as other Calabrian churches attest to the encounter of Sicilian elements with strong Byzantine influence transmitted by Basilian monks.

In Campania, a typical church related to that of Monte Cassino (where Byzantine artists worked) is the Church of Sant'Angelo in Formis (11th cent.). The frescoes of this church (II, PL. 285), together with the illuminated manuscripts produced by Benedictine artists in the scriptoria of Monte Cassino, con-

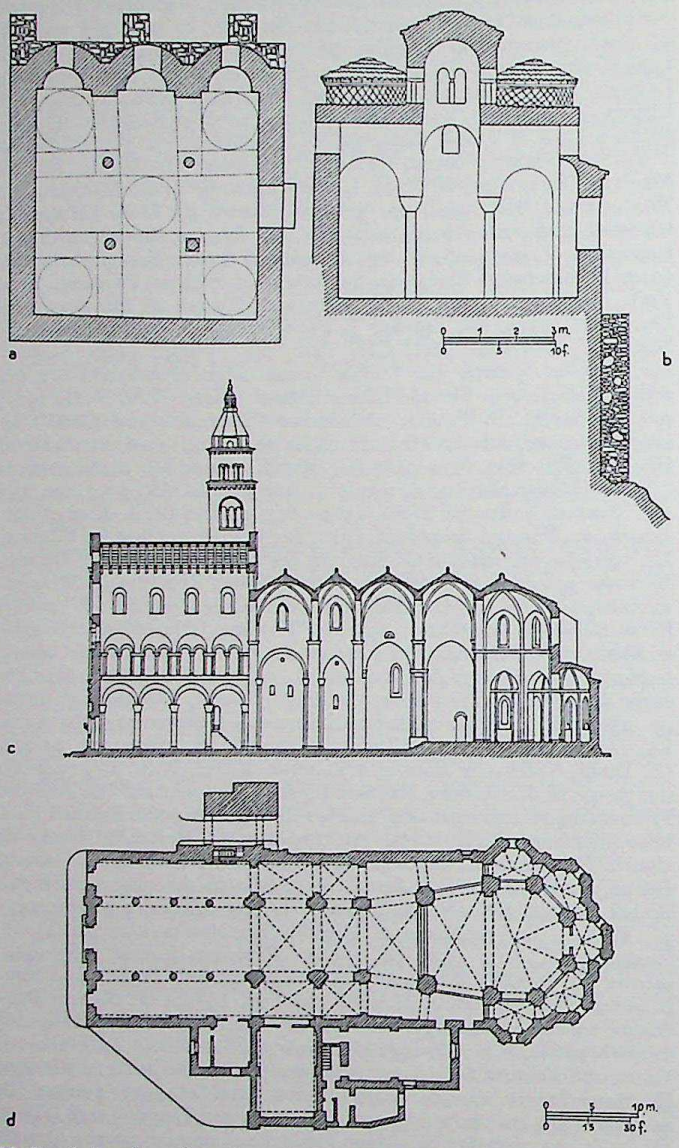
stitute the chief examples of this region's Romanesque painting. The Arab architectural taste is seen especially in decoration (Amalfi, Chiostro del Paradiso; Caserta Vecchia, Cathedral, 1153; Ravello, Palazzo Rufolo).

In sculpture, such work as the ivory altarpiece of the Cathedral of Salerno (12th cent.) reflects a classical feeling that



Medieval churches of southern Italy. (*a, b*) Stilo, La Cattolica, 10th cent., plan and transverse section; (*c, d*) Barletta, Cathedral, 12th–15th cent., longitudinal section and plan (*from L'Architettura, XXXIV, 1958*).

is of Byzantine origin. Yet the pulpits of this same Cathedral (late 12th cent.), though they are classical in structure, are richly decorated with marble inlay and mosaic of mixed Sicilian and Arabic inspiration. The bronze door of the Cathedral of Benevento (first half of the 13th cent.) testifies to western Romanesque influence. The Campanian classical tradition enjoyed a revival in the reign of Frederick II (see ANTIQUE REVIVAL). There are productions of this revival both in Campania (works in Capua, Mus. Prov. Campano) and in Apulia (Castel del Monte). Nicola d'Apulia, later known as Nicola Pisano (q.v.), was probably a product of this milieu. The pulpit of the Cathedral of Ravello (1272) by Niccolò di Bartolommeo da Foggia belongs to this classicizing trend.

In Apulia Byzantine influence (e.g., domes of the Cathedral of Canosa di Puglia, late 11th cent.) and Norman influence (e.g., towers of S. Nicola in Bari, 11th–12th cent., and the high roof slopes combined with Lombard forms, especially in the Terra di Bari region (Bari; Bitonto; Trani, 12th cent.; Ruvo di Puglia, 13th cent.; PL. 172), and with Pisan forms in the Capitanata region (Troia, 11th–12th cent.; Siponto; Monte Sant'Angelo). Although Byzantine and Islamic elements are to be found in sculpture of this period (the bronze door of the Cathedral of Troia, 1119; doors by Barisanus of Trani in Trani, IX, PL. 508, Ravello, 1179, and Monreale), it is chiefly the influence of Lombard and northern European work that is reflected in contemporaneous sculptural decoration of church doors and furnishings.

In Sicily, the three sources of stylistic influence were assimilated with particularly coherent and original results. The Arabic element is evident in the prevalence of the pointed arch, small elevated domes, and exterior decoration featuring interlaced arches. The Norman element, that is to say, the Latin monastic factor, is apparent in the elevation of buildings and in the use of large façade towers, and the mosaic decoration of interiors achieves a typically Byzantine magnificence (PL. 426; II, PLS. 286, 456, 457; see MOSAICS). Many religious and secular structures arose in Sicily during this period (ca. 1060–ca. 1200). The most noteworthy are in Palermo, Cefalù (PL. 173), and Monreale (PL. 426; FIG. 401). Cathedrals, churches, palaces, and castles (e.g., Palermo, the Zisa and the Cuba) strongly reflect Islamic influence.

The era of Gothic architecture in southern Italy began with the great building activity of Frederick II and continued throughout the period of Swabian domination. In Sicily, the Cistercians, who had left incomplete a large basilica in Murgo near Lentini (ca. 1225), were employed by Frederick II in the building of Castel Maniace in Syracuse. This castle, like the Castello Ursino in Catania (FIG. 396) and Castel del Monte in Apulia, is one of the chief examples of the kind of architecture built under that ruler. In connection with all this building, important work was carried on in the field of sculpture. The Sicilian Vespers (when Sicily severed itself from the mainland domination of the Angevins) all but marked the end of the development of Gothic architecture in Sicily. Subsequent activity was limited to a phenomenon of purely local importance — "Chiaramontane" architecture (named for the Palazzo Chiaramonti, Palermo, 1307).

Building activity in Naples, on the other hand, greatly increased at this time. The Angevin court probably employed French architects (the choir of S. Lorenzo Maggiore, the Church of S. Eligio), which would explain the connections with French Gothic architecture and, during the reign of Robert of Anjou, Provençal architecture that are evident in many Neapolitan churches. Yet local craftsmen endowed the architecture with a special flavor (e.g., S. Chiara, S. Maria Donnaregina, S. Domenico Maggiore, the Cathedral, and S. Pietro a Maiella, all of which were built in the first three decades of the 14th century). This period was also marked by great activity in painting and sculpture. Pietro Cavallini, Simone Martini, and Giotto (qq.v.) worked in Naples, and their production and that of their assistants played a decisive role in the development of local painting and manuscript illumination. A notable example of their influence is the fresco cycle in the Church of S. Maria Incoronata. These frescoes may be the work of Roberto d'Oderisio (second half of 14th cent.), a painter with whom Giovanni di Pietro da Napoli (active later at Pisa) was at first associated. The Sienese sculptor Tino da Camaino (q.v.) played a role of prime importance in the artistic life of Naples from 1324 to 1337. Briefly followed in this role by Lando di Pietro, Tino spread knowledge of Tuscan sculpture throughout southern Italy. They were followed in Naples by Giovanni and Pacio da Firenze (the tomb of Robert of Anjou in S. Chiara, 1343).

The disposition to welcome foreign works and artists continued through the second half of the century (e.g., the Florentine painter Niccolò di Tommaso and the Sienese Andrea Vanni). This tendency grew stronger in the 15th century, when, owing in part to the political vicissitudes of the city, Naples embraced the influences of Flemish painting (the Van Eycks and Rogier van der Weyden), Catalan (Jacomart Baçó), and French (Fouquet). Thus was established the artistic milieu to which Antonello da Messina (q.v.) was to be drawn during the period of his apprenticeship with the Neapolitan Colantonio. After the Lombard painter Leonardo Molinari da Besozzo, who went to

Naples in 1442 (frescoes in S. Giovanni a Carbonara), there was a new influx of northern painters toward the end of the century. Bramantino and Antonio Solari went to Naples, as did Cristoforo Sacco of Verona, and they added their influence to that of Antoniazzo Romano. The Renaissance style penetrated Naples only sporadically. Indeed, local activity in architecture and sculpture was dominated by stonecutters from Latium, the best known being Antonio Baboccio da Piperno. The work of these Latian craftsmen, with its Gallicizing archaisms, provided a natural transition to the Catalan Flamboyant Gothic of the 15th century. (Guillermo Sagrera worked on the Castel Nuovo toward the middle of the century.) The first Renaissance undertaking in Naples was the triumphal arch of Alfonso of Aragon in the Castel Nuovo. The Palazzo Cuomo is another of the very few surviving Renaissance structures in Naples. Active in Naples toward the end of the century were Giuliano da Maiano (the Porta Capuana; the villa at Poggioreale, destroyed) and the Veronese Fra Giovanni Giocondo.

Renaissance sculpture had made an early but almost unnoticed appearance in Naples in the Brancacci Tomb, on which both Donatello and Michelozzo worked (IV, PL. 245). Later came the sculptors of the triumphal arch of Alfonso of Aragon — Francesco Laurana (see RENAISSANCE), Domenico Gaggini, and other artists, both Roman and Lombard. Finally Antonio Rossellino, Benedetto da Maiano, and Guido Mazzoni worked in the Church of Monte Oliveto (S. Anna dei Lombardi).

The local flavor of 14th-century architecture in Sicily was preserved in 15th-century architecture, which was in close contact with Catalan Gothic. Even at the end of the 15th century, elements of Spanish derivation persisted, forming an integral part, for example, of the complex artistic personality of Matteo Carnevale (Matteo de Carnilivari; Palermo, Palazzo Aiutamicristo and Palazzo Abbatelli). Renaissance style first appeared in the portals in the Cathedral of Palermo decorated by Domenico Gaggini, who went to Palermo in 1463. Francesco Laurana worked in Sicily after 1467 and brought the Renaissance style in sculpture to the island. In painting of the first decades of the 15th century, notable in Syracuse was Valencian influence, which tended to assimilate Adriatic elements. Similar trends developed in Palermo, where Tuscan elements of lesser importance (from Pisa and Siena) were also operative. Thus was forged in Sicily a modest link in that chain of mutual influence among the Mediterranean cities which, in Spain, had among its exponents Gherardo Starnina and the Master of the Bambino Vispo. Spanish influence also took on some Provençal coloring (as in Naples). A manifestation of this complex interaction of influences is the fresco of the Triumph of Death in Palermo (Gall. Naz. della Sicilia). Catalan-Provençal and Adriatic idioms combined in the art of Tommaso de Vigilia and the Piazza Armerina Master (Crucifix, Piazza Armerina, Cathedral), who may be one and the same person. Similar influences affected Riccardo Quartararo, who also worked in Naples. In eastern Sicily the most notable painter was Marco di Costanzo (paintings in Syracuse, Cathedral). After Antonello da Messina the school of Messina was continued by his relatives Jacopo (Jacobello) d'Antonello and Antonello de Saliba, who were rather modest artists. Antonio Giuffrè (called "Antonello de lu Re") and Salvo di Antonio represented the school on the threshold of the 16th century.

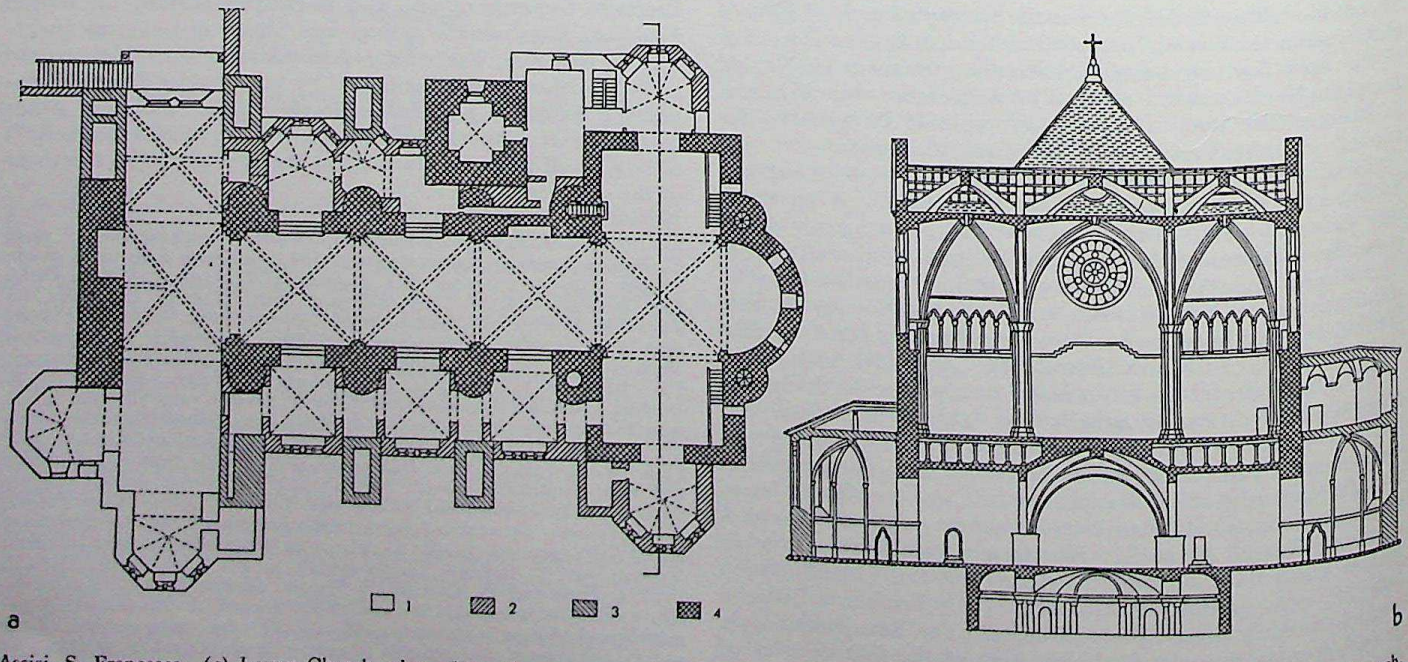
Centrale del Restauro, 14–15, 1953, pp. 67–168, esp. 155). *Barisanus of Trani*: late-12th-century sculptor (A. Boeckler, Die Bronzetüren des Bonanus von Pisa und des Barisanus von Trani, Berlin, 1953). *Matteo Carnevale* (*Matteo de Carnilivari*): 15th-century Sicilian architect (F. Meli, Matteo Carnelivari e l'architettura del Quattro e Cinquecento in Palermo, Rome, 1958). *Colantonio*: ca. 1352–1442, Neapolitan painter (A. Maresca, Osservazioni sulla vita di Colantonio del Fiore, Naples, 1883; C. Aru, Colantonio, ovvero il "Maestro della Annunciazione di Aix," Dedalo, XI, 1930–31, pp. 1121–41; C. Grigioni, Il primo documento d'archivio su Colantonio, pittore napoletano, Arti Fig, III, 1947, pp. 137–39). *Marco di Costanzo*: 1468–1500, Syracusan painter (S. Bottari, Un pittore siciliano del Quattrocento: Marco Costanzo, BArte, XXXVI, 1951, pp. 124–29; G. Vigni and G. Carandente, I restauri compiuti dall'Istituto Centrale del Restauro per la Mostra di Antonello da Messina e del Quattrocento siciliano, B. Ist. Centrale del Restauro, 14–15, 1953, pp. 67–168, esp. 127). *Domenico Gaggini*: d. 1492, sculptor (G. Di Marzo, I Gagini in Sicilia e la scultura in Sicilia nei secoli XV e XVI, 2 vols., Palermo, 1880–83; E. Mauceri, L'opera di Domenico Gagini in Sicilia, L'Arte, VI, 1903, pp. 147–58; W. R. Valentiner, The Early Development of Domenico Gagini, BM, LXXVI, 1940, pp. 76–87; M. Accascina, Aggiunte a Domenico Gagini, BArte, XLIV, 1959, pp. 19–29). *Antonio Giuffrè* (called *Antonello de lu Re*): Messina, late-15th-century painter (E. Brunelli, Antonio Giuffrè, Rass. d'arte, VII, 1907, pp. 109–10; G. Vigni and G. Carandente, I restauri compiuti dall'Istituto Centrale del Restauro per la Mostra di Antonello da Messina e del Quattrocento siciliano, B. Ist. Centrale del Restauro, 14–15, 1953, pp. 67–168, esp. 144). *Niccolò di Bartolommeo da Foggia*: 13th-century sculptor (S. Bottari, Intorno a Nicola di Bartolomeo da Foggia, Comm, VI, 1955, pp. 159–63). *Riccardo Quartararo*: doc. 1485–1501, Sicilian painter (L. Serra, Su Riccardo Quartararo, Rass. d'arte, IX, 1909, pp. 203–05; S. Bottari, Da Tuccio di Gioffredo a Riccardo Quartararo, Arte antica e moderna, II, 1959, pp. 170–72). *Roberto d'Oderisio* (*Roberto Oderisi*): Neapolitan painter of the second half of the 14th century (B. Berenson, A Panel by Roberto Oderisi, Art in America, XI, 1923, pp. 69–76; V. Lasareff, A New Panel by Roberto Oderisi, BM, LI, 1927, pp. 128–29; O. Morisani, An Altar Panel by Roberto d'Odorisio, AQ, XX, 1957, pp. 156–62). *Salvo di Antonio*: Messina, doc. 1493–1526, painter (G. Vigni and G. Carandente, I restauri compiuti dall'Istituto Centrale del Restauro per la Mostra di Antonello da Messina e del Quattrocento siciliano, B. Ist. Centrale del Restauro, 14–15, 1953, pp. 67–168, esp. 163). *Cristoforo Scacco*: b. Verona, active in southern Italy ca. 1500, painter (A. De Santis, Della patria di Cristoforo Scacco, ArtiFig, II, 1946, pp. 226–30; R. Causa, Due tavole inedite ed una precisazione cronologica di Cristoforo Scacco, Paragone, III, 25, 1952, pp. 40–43). *Tommaso de Vigilia*: doc. 1460–93, painter [G. Vigni and G. Carandente, I restauri compiuti dall'Istituto Centrale del Restauro per la Mostra di Antonello da Messina e del Quattrocento siciliano, B. Ist. Centrale del Restauro, 14–15 1953, pp. 67–168, esp. 159; S. Bottari, Taccuino meridionale, I: Resti di un polittico di Tommaso de Vigilia (?), Arte antica e moderna, III, 1960, pp. 159–60].

Umbria. During the Romanesque period Lombard craftsmen were active in Umbria. At work chiefly on the basilicas, they were subject to Latian influences and drew inspiration from surviving classical monuments in Umbria. A typical aspect of their activity was compartmental treatment of façades (Assisi, Cathedral, built by Giovanni da Gubbio, 1140, 13th-cent. façade; Spoleto, S. Pietro, PL. 176). Spoleto, Assisi, and Bevagna are rich in buildings of the Romanesque period. There are also important examples of the Romanesque in Ferentillo, Perugia, Narni, Todi, and Foligno. At the beginning of the Gothic period Assisi assumed a leading position in architecture with the construction of the Church of S. Francesco (PL. 186; FIG. 403). Begun in 1228, this basilica became the splendid model for the single-aisled churches of the predicant orders. Moreover, at the end of the century it was host to a peerless school of Italian painting. Umbrian churches modeled after S. Francesco include S. Chiara in Assisi, S. Francesco in Gualdo Tadino, and S. Francesco al Prato in Perugia. Other churches, however (Perugia, S. Domenico and the Cathedral; Todi, S. Fortunato), derived from France the scheme of three aisles of equal or nearly equal height. Of special distinction is the civil architecture of the time, which retained something of the Romanesque in its rude severity and in the blocklike mass of the *palazzi*, such as those in Todi, Perugia, Orvieto (PL. 186), Gubbio, and Città di Castello. The architect in the case of the last two cities was Angelo da Orvieto. A later architect of genius was Gattapone (Matteo di Giovannello di Maffeo), who worked extensively in Umbria (Assisi; Spoleto, the fortress; 1362–70; Perugia, S. Giuliana, cloister).

In sculpture, after the work of Nicola and Giovanni Pisano in Perugia and of Arnolfo in Orvieto, Umbrian sculpture came under the influence of Siena, particularly through the work of Lorenzo Maitani (q.v.) on the façade of Orvieto Cathedral. Symptomatic of this change is the fact that Angelo and Francesco di Pietro d'Assisi, who executed, among other works, the tomb of St. Margaret of Cortona for the Church of S. Margherita, Cortona, were altogether Sienese in style.



Assisi, S. Francesco. (*a*) Lower Church, plan. *Key*: Constructions of (1) 1228–39; (2) 1280–1300, (3) 1300–50; (4) 1350–1400. (*b*) Upper Church, Lower Church, and crypt, transverse section (*from B. Kleinschmidt, San Francesco in Assisi, Berlin, 1915*).

Umbrian painting of the 12th century is represented by frescoes in the Abbey of S. Pietro in Valle, near Ferentillo, and in the Church of S. Maria Infraportas in Foligno, as well as by Alberto Sotio's Crucifix of 1187 (PL. 177). To Sotio are also attributed the frescoes in the Church of SS. Giovanni e Paolo in Spoleto. Local initiative of the 13th century is exemplified by frescoes signed by a certain Bonamico (1225, Perugia, S. Prospero). Later, the influence of Giunta Pisano appeared, as in the St. Francis Master (Assisi, S. Maria degli Angeli), and continued to have some effect up to the execution of the frescoes in S. Francesco, which then established Assisi as a painting center. However the work in Assisi had slight effect on the course of 14th-century Umbrian painting, which was chiefly influenced by Sienese art, although occasional influences from Florence and the Marches made themselves felt. Meo di Guido da Siena was active for a long time in Perugia, and subsequently the style of the Lorenzettis was especially influential in Gubbio (frescoes by Guido di Palmerucci). Under the leadership of Ugolino di Prete Ilario (frescoes in Orvieto Cathedral: Chapel of the Holy Corporal, 1357–64, and choir, 1370–80) there was established in Orvieto a group of masters who worked in a Sienese style. One of this company was Pietro di Puccio, who later worked in the Camposanto in Pisa. Ottaviano Nelli of Gubbio was an exponent of the late Gothic trend in Umbria. Although he possessed a style akin to that prevalent in the Marches, he was vitally affected also by Bolognese miniature painting (PL. 186; frescoes, Foligno, Palazzo Trinci, 1424; frescoes, Urbino, Oratorio di Sta Croce, 1428–32). Bartolomeo di Tommaso da Foligno, who worked in the Marches as well as in Umbria, is another artist whose forceful style was of late Gothic derivation (Foligno, S. Salvatore, triptych of 1437; Foligno, Pin. Com., fresco, 1449). About 1425 Gentile da Fabriano (q.v.) worked in Orvieto, and Masolino was in Todi in 1432. Innovations appeared with Domenico di Bartolo and Domenico Veneziano in Perugia (1438) and with such works as the polyptych (1437) in Perugia (Gall. Naz. dell'Umbria) by Angelico (q.v.; who was in Orvieto in 1447); works by Gozzoli in Montefalco (1450–52), Narni, and Foligno; a polyptych by Piero della Francesca (ca. 1460, Perugia, Gall. Naz. dell'Umbria); and frescoes by Lippi in Spoleto (1467–69). The Umbrian school of the 15th century, with its two principal branches in Foligno and Perugia, was founded on the work of these artists. Proximity to Montefalco placed the artists of Foligno in particular contact with the art of Benozzo Gozzoli. Such was the case of Pierantonio Mezzastris and Niccolò Alunno (Niccolò di Liberatore di Giacomo di Mariano). The latter also worked in the Marches, and there he became acquainted with the works of the Vivarinis and of Crivelli and derived from them a very personal firmness of style and an intense, naturalistic expressiveness (polyptych, 1483, Nocera Umbra, Pin.; polyptych, 1492, Foligno, S. Nicolo). Matteo da Gualdo was also allied to the Foligno group. Among the Perugians the influence of Florentine art was more varied in effect. Benedetto Bonfigli subtly assimilated the lessons of Domenico di Bartolo, Filippo Lippi, and Benozzo Gozzoli (PL. 203; processional banners, e.g., Perugia, Chapel of the Confraternità della SS. Concezione, 1461). Bartolomeo Caporali was a collaborator of Bonfigli. Fiorenzo di Lorenzo (PL. 203) absorbed various influences. Although Perugino (q.v.) was, in a certain sense, the very symbol of Umbrian painting, he rose above this provincial environment by virtue of the high level of his art. One of Perugino's many pupils, among whom even Raphael (q.v.) is to be numbered, was Bernardino Betti, known as Pinturicchio (q.v.). Translating, as it were, his master's poetry into prose, Pinturicchio gradually turned to narrative illustration and to a decorative evocation of a miniaturist's color (Rome, S. Maria in Aracoeli, Chapel of St. Bernardino; the Borgia Apartments in the Vatican, 1492–94; Spello, S. Maria Maggiore, Baglioni Chapel, 1501; Siena, Cathedral and Piccolomini Library, 1503–08). Giovanni di Pietro, known as Lo Spagna, and Eusebio da San Giorgio both helped to spread the influence of the art of Perugino and Raphael. Pastura (Antonio Massari da Viterbo) followed Perugino and Pinturicchio.

Renaissance architecture and sculpture made intermittent appearances in Umbria — in the work of Agostino di Duccio (Perugia, Oratory of S. Bernardino, façade, 1457–61; Porta S. Pietro, 1475) and in that of a follower of Verrocchio, Francesco di Simone Ferrucci (Perugia, S. Maria di Monteluce, tabernacle, 1483; Ancarano, S. Maria Vecchia, a marble Madonna). The plan of Francesco di Giorgio's Church of the Madonna del Calcinaio, near Cortona, influenced that of the Church of the Madonna dei Miracoli in Castel Rigone (1494). Perugia has a Renaissance building in its Palazzo del Capitano del Popolo (1472), and the Cathedral in Città di Castello was renovated under the inspiration of works of Il Cronaca and Sangallo. But it was not until the 16th century that native Umbrian architects came into their own. Such architects were Ippolito Scalza of Orvieto, who was also a sculptor, the Perugians Valentino Martelli and Vincenzo Danti, who was also a sculptor (IX, PL. 307), and the architect and painter Adone Doni (Dono dei Doni) of Assisi. The last three artists all entered into Michelangelo's sphere of influence, discarding any traces of membership in an Umbrian school. Likewise lacking any specific Umbrian character were the Perugian Galeazzo Alessi, who worked in Genoa and Milan, and Ascanio Vittozzi of Orvieto, who worked in Piedmont.

active first half of 15th century, painter (L. Bonfatti, Memorie storiche di Ottaviano Nelli, Gubbio, 1843; U. Gnoli, Affreschi del Nelli in Fano, Rass. d'arte umbra, II, 1911, pp. 10–15; F. Santi, Un capolavoro giovanile di Ottaviano Nelli, Arte antica e moderna, III, 1960, pp. 373–84). *Niccolò Alunno* (*Niccolò di Liberatore di Giacomo di Mariano*): Foligno, ca. 1430–1502, painter (R. Ergas, Niccolò di Liberatore gennant Alunno, Munich, 1912; U. Gnoli, Opere inedite e opere smarrite di Niccolò da Foligno, BArte, VI, 1912, pp. 249–62). *Guido di Palmerucci*: b. Gubbio, 1280; d. after 1345; painter (R. van Marle, Guido Palmerucci e la sua scuola a Gubbio, Rass. d'arte umbra, III, 1921, pp. 7–13; M. Salmi, Un polittico di Guido Palmerucci, Belvedere, IV, 1923, pp. 38–42; R. van Marle, Nuove opere di Guido Palmerucci, La Diana, VI, 1931, pp. 267–69). *Pinturicchio* (q.v.). *Giovanni di Pietro*, called *Lo Spagna*: b. ca. 1450; d. Spoleto, 1528; painter (Catalogo della mostra delle opere di Giovanni di Pietro detto lo Spagna nel IV centenario della morte, Spoleto, 1928). *Ugolino di Prete Ilario*: Orvieto, 14th–15th-century painter and mosaicist (R. van Marle, La scuola pittorica orvietana del '300, BArte, N.S., III, 1923–24, pp. 305–35).

The Marches. The Romanesque architecture of the Marches represents an encounter of Byzantine traditions (e.g., the form of the Greek cross inscribed in a square, the plan of such churches as S. Claudio al Chienti, near Macerata, and Sta Croce in Sassoferrato) and Adriatic and Lombard influences (S. Maria di Portonovo, 11th cent., near Ancona; Ancona Cathedral, 11th–13th cent.; Baptistery of Ascoli Piceno, 12th cent.). The miniature arches of the façade of S. Maria della Piazza in Ancona (PL. 176) are a Pisan motif that seems to have come to the Marches from Dalmatia. The geometrical compartmentation of the façade of SS. Vincenzo e Anastasio in Ascoli Piceno is an Umbrian feature. Elements of Umbrian derivation were more numerous in the Gothic period (Camerino, S. Venanzio; Ascoli Piceno, S. Francesco), when Venetian influence also made itself felt. The Venetian contribution became more important in the early years of the 15th century, inspiring such monuments as the portal of the Church of S. Domenico in Pesaro, executed in the manner of the Dalle Masegne, and that of the Church of S. Nicola in Tolentino by the Florentine-Venetian Il Rosso (q.v.). These portals, together with the works of Giorgio da Sebenico in Ancona [Loggia dei Mercanti, ca. 1455, and portals for the churches of S. Francesco delle Scale (S. Maria Maggiore) and of S. Agostino], are among the few examples we have of the sculpture of this region.

Painting in the Marches soon manifested distinctive local characteristics, although it was contained within the framework of derivation from the great art of Tuscany. The school of the Marches may be said to begin with the work of the Master of Campodonico (near Fabriano), an artist influenced by Giotto and by Sienese painting; the Master of Campodonico painted the frescoes in the Abbey of S. Biagio in Caprile (1345). This anonymous master seems to have provided the starting point for Allegretto Nuzi of Fabriano, who visited Florence about the year 1346. Allegretto produced a provincial variant of the colorful Giottesque manner of Bernardo Daddi that was craftsmanly but heavy in its handling of decorative elements (PL. 186). Allegretto Nuzi found a follower in Francescuccio Ghissi. From this modest milieu emerged Gentile da Fabriano (q.v.), whose career constitutes an important chapter in the history of late Gothic painting. The brothers Lorenzo and Jacopo Salimbeni of Sanseverino, attractive representatives of late Gothic painting in the Marches, worked together on the frescoes in the Church of S. Giovanni Battista in Urbino (VI, PL. 383) and on those (preserved in fragmentary state) in the Old Cathedral at Sanseverino. Their art reflects northern Italian influences, probably transmitted through illuminated manuscripts. Gentile da Fabriano exerted a strong influence on Arcangelo di Cola da Camerino, who was also in contact with Florence (1420–21). Contacts with Tuscany, with the art of Siena, and with the art of Piero della Francesca are evident in the work of Giovanni Boccati da Camerino (Madonnas, Perugia, Gall. Naz. dell'Umbria; polyptych, 1468, Belforte del Chienti, S. Eustachio). The contemporary Girolamo di Giovanni da Camerino (polyptych, Monte San Martino, 1473; triptych, Milan, Brera, PL. 203) strongly felt the influence of the Vivarinis and Carlo Crivelli. In fact, Crivelli had settled in the Marches in 1468, and Pietro Alemanno, who came to the Marches from Austria, became a loyal follower of that artist (works in Ascoli Piceno, Pin. Civ.). Lorenzo d'Alessandro da Severino is another painter for whom the influence of Crivelli proved essential. Another basic influence upon Lorenzo was that of Niccolò Alunno (triptych, Corridonia, SS. Pietro, Paolo e Donato, 1481; frescoes, Sarnano, S. Maria di Piazza, 1483). Painting in Fabriano in the second half of the 15th century is represented by Antonio da Fabriano II (Crucifix, Matelica, Mus. Piersanti, 1452; triptych and standard, Genga, parish church), whose work was influenced by Piero della Francesca and Flemish painting. A second representative of this school is Francesco di Gentile, whose work is marked by nostalgic reminiscences of late Gothic style and the influence of Crivelli and of Antonio da Fabriano (works Matelica, Mus. Piersanti; Perugia, Gall. Naz. dell'Umbria; Rome, Vat. Mus.).

Urbino, the seat of the Montefeltro family, was an extraordinary center of Renaissance culture, one of the most brilliant and characteristic of 15th-century cities. Urbino was the meeting point of such personalities as Luciano Laurana, Francesco di Giorgio, Piero della Francesca, and Bramante (qq.v.), and from Urbino came, almost as the natural product of such an environment, Raphael, the greatest painter of the Marches. At a lower level, the art of the second half of the 15th century manifested itself in Urbino in the work of Giovanni Santi (Raphael's father), Evangelista di Pian di Meleto, and the painter and architect Girolamo Genga. Urbino was represented in the 16th century by Federico Barocci (q.v.), an artist of originality who studied Raphael, Correggio, and the Venetians and elaborated an elegant style (IV, PL. 429; IX, PL. 303).

A vital center of artistic activity during the 15th–16th centuries was Loreto. Many artists worked on the Sanctuary of the Holy House from 1468 on, including such architects as Giuliano da Maiano, Giuliano da Sangallo, Baccio Pontelli, Bramante, and Andrea Sansovino; the painters Luca Signorelli and Melozzo da Forlì; and the sculptors Andrea Sansovino and Baccio Bandinelli.

After the 16th century there was no school of the Marches in any strict sense of the term. Artists from the Marches, among them Simone Cantarini da Pesaro, Carlo Maratti, Sassoferrato (G. B. Salvi; PL. 219) and Mario de' Fiori (Mario Nuzzi), were assimilated in the great current of Bolognese and Roman 17th-century painting. The neoclassic Giuseppe Piermarini became Milan's chief architect. Regional characteristics survived only in the minor arts.

The Abruzzi. Although the Abruzzi region was exposed to diverse influences, it retained the conservative attitude characteristic of mountainous localities. During the Romanesque period, the monasteries assimilated artistic trends of various origins. The effects may be seen in such churches as S. Liberatore della Maiella (a ruin; second half of 11th cent.), S. Giovanni in Venere, and the Basilica Valvense (or Basilica of S. Pelino), near Pentima (1104–24). Lombard, Apulian, and Campanian influences are evident in these churches. The early Gothic features of the Abbey church of S. Clemente a Casauria reveal an inclination toward French taste (PL. 176). Characteristic of the architecture of the Abruzzi are the preferences for timber roofing and for the church façade surmounted by a horizontal crowning element. These predilections survived until the 16th century, from the 13th-century Cathedral of Atri and the Church of S. Maria di Collemaggio in Aquila (decorated with polychrome inlay) to the façade by Cola dall'Amatrice (Nicola di Filotesio) for S. Bernardino in Aquila (1527).

The art of the Abbey of Monte Cassino inspired the painting of the 12th and 13th centuries in the Abruzzi region. Examples include frescoes in S. Pellegrino in Bominaco, 1263, and in S. Maria delle Grotte (or ad Cryptas) near Fossa, 1283. The 14th-century frescoes in the Cathedral of Atri reveal some awareness of northern Gothic art, as does contemporary miniature painting in the Abruzzi, which was influenced by Neapolitan and French work. Tuscan influences, especially Sienese, were also important in the Abruzzi (e.g., S. Maria Arabona, the frescoes of 1373). Fifteenth-century painting in the Abruzzi found its chief representative in the naïve but imaginative Andrea Delitio, whose art stood midway between the Gothic style and the narrative style of Benozzo Gozzoli. Among Andrea's works is a fresco of St. Christopher in Guardiagrele, in the Church of S. Maria Maggiore, 1473; there are frescoes attributed to him in the Cathedral of Atri. The influence of two artists who worked in Ascoli Piceno was felt in the Abruzzi. They were Cola dall'Amatrice and Pietro Alemanno (see above, *The Marches*).

The art of sculpture flourished in the Abruzzi as early as the Romanesque period, as witness the many carved pulpits in local churches. There are also signs of Near Eastern influence in these pulpits. In the 14th century the influence of Tuscan and Neapolitan sculpture reached the Abruzzi (e.g., sepulcher in S. Maria della Strada, near Matrice), and in the first decades of the 15th century the sculpture of the Abruzzi reflected a northern and flamboyant Gothic style introduced by Gualtiero d'Alemagna (tomb, Caldora Chapel, Sto Spirito, Sulmona, 1412; Camponeschi tomb, S. Biagio, Aquila, 1432, attributed). The contemporary Nicola Gallucci da Guardiagrele, an elegant goldsmith and sculptor (crosses and ostensoria, VI, PL. 265; Francavilla Alta, S. Franco, 1413; Atessa, S. Leucio, 1418; Lanciano,

S. Maria Maggiore, 1422), came into contact with the art of Florence, that of Ghiberti in particular (silver altar in the Cathedral of Teramo, 1433–38). Later, a certain Andrea di Jacopo, said to be from Aquila and termed a "disciple of Donatello," worked on the triumphal arch of Alfonso of Aragon in Naples. To this Andrea is attributed the altar of the Church of the Madonna del Soccorso in Aquila. Another important sculptor was Silvestro da Sulmona (Silvestro di Giacomo di Paolo da Sulmona). The noble style of his work in Aquila took inspiration from Florentine sculpture of the second half of the 15th century, from Antonio Rossellino in particular (Agnifili tomb, Cathedral, 1476–80; wood sculpture of St. Sebastian, Mus. Naz. d'Arte Abruzzese; tomb of Maria Pereira, S. Bernardino, 1488; terra-cotta Madonna, S. Bernardino, ca. 1495). Documents indicate that Silvestro was also a painter and architect.

After the 15th century, specifically regional characteristics survived only in such minor arts as pottery, wrought iron, and lacemaking.

Art in Rome and Latium to the pontificate of Julius II. During the Middle Ages, the principal element in the continuity of what can be called a Roman tradition in art was the inspiration that artists drew from Early Christian models, which were equally influential in the 7th–8th century (S. Maria in Cosmedin, fig. 411, I, pl. 394; S. Giorgio in Velabro) and in the 12th (S. Clemente, pl. 176, III, pl. 477; S. Maria in Trastevere, fig. 389). From the time of the "palimpsest" frescoes in S. Maria Antiqua, that is, from the 8th century, there were two stylistic currents in painting — one of Byzantine inspiration, the other deriving from the freer tradition of late Roman art intermixed with Syrian influences. In the 9th century, in the fervor of the renewed construction of basilicas (S. Maria in Domnica and S. Prassede being among the principal objects of that activity), Byzantine influence manifested itself in mosaics and in the consequent renunciation of plastic effects in favor of the luministic effects of the mosaic tesserae. But in this same period, mural painting exhibited great feeling (inspired by Benedictine acquaintance with Carolingian manuscript illumination) for energetic line and dynamic figure representation (*Assumption* in the lower church of S. Clemente). This artistic current developed throughout the 10th century and, having assimilated the subtleties of Byzantine line, produced such 11th-century works as the frescoes in the Castel Sant'Elia (near Civita Castellana) and a panel in the Vatican (by the same artists),

the scenes from the lives of SS. Alexis and Clement in the lower church of S. Clemente (1095–1106), and a triptych in the Cathedral of Tivoli. As for mosaics, the apse decoration of S. Clemente (X, PL. 194) and of S. Maria in Trastevere (PL. 177) marked a renewal of Early Christian solemnity of style, which paralleled a similar development in architecture.

While 12th-century Roman architecture was marked by a classical revival, other Lombard influences also penetrated Rome. Square campaniles were characteristic structures of the period; each story was decorated with double-arched apertures, and the

basically Lombard manner of construction was softened by the colorful decoration of marble and of majolica plates set into the brick. Similarly typical of this period were cloisters that featured arcades, usually having small painted columns. The marbleworkers who decorated the cloisters, pavements, pulpits, episcopal thrones, and paschal candlesticks of the period are known collectively as the Cosmati (q.v.).

The classicizing movement in Roman painting, rooted in Early Christian and Byzantine art, came to a climax with the artists of the second half of the 13th century. The most important of these was Pietro Cavallini (q.v.). There was in this art an exchange of influences between Florence and Rome. Cimabue, Arnolfo, and Giotto were in Rome for a period after 1272. Roman masters, on the other hand, were active in the Upper Church of S. Francesco in Assisi. Among these artists was Jacopo Torriti, the creator of the apse mosaics of St. John Lateran (1291) and of S. Maria Maggiore (PL. 177) in Rome. Filippo Rusuti, who created mosaics for the façade of S. Maria Maggiore, was a modest follower of Torriti and Cavallini. The effects of the encounter of Roman and Florentine art can also be seen in a triptych (the central panel of which depicts the Saviour) in the Church of S. Andrea, Anagni; in the frescoes of S. Maria in Vescovio, Stimigliano; and in the frescoes of the Sacro Speco, Subiaco (where Conxolus also worked). From Viterbo, where Sienese influence was dominant, came Matteo di Giovanetti, who worked in Avignon (1343–66) with Simone Martini (q.v.) and in that artist's style. Matteo's work substantially represents Latium's contribution to Gothic art.

The removal of the papal seat to Avignon (1309–77) brought artistic activity in Rome to a halt. Consequently Rome has few examples of Gothic architecture (the mere vestige of the Franciscan reconstruction of S. Maria in Aracoeli, and S. Maria sopra Minerva, ca. 1280, modeled after the Dominican Church of S. Maria Novella in Florence). Even the work of Arnolfo di Cambio (q.v.) had little following in Rome, save in the modest work at the end of the 13th century of Giovanni and Deodato di Cosma, who represent the decline of the Cosmati marbleworkers. Almost no works of art were produced during the 14th century, and even after the return of the papacy, schism and disputes over the reestablishment of papal power precluded all thought of artistic activity until after 1420.

The Renaissance came early to Rome. In fact, at the very time when Gentile da Fabriano (1427) and Pisanello (1431), representatives of the older trends, were summoned to paint in St. John Lateran (the works are lost), Masaccio and Masolino (qq.v.) also went to Rome. Leon Battista Alberti had served as papal abbreviator to Pope Eugenius IV, and perhaps it was Alberti who recommended Bernardo Rossellino to the Humanist pope Nicholas V when the latter first turned his attention to the problem of a new St. Peter's. Fra Angelico and Benozzo Gozzoli (qq.v.) both worked in the Vatican from 1448 to 1450, and after them, in 1459, Piero della Francesca (q.v.; whose Vatican works are lost). It is not certain what works Alberti and Rossellino did execute, but among the possibilities is the Palazzo Venezia (FIG. 413), built after 1455 for Pope Paul II. The tempo of building activity quickened in the second half of the century, especially under Sixtus IV. Important in this activity was the Florentine Baccio Pontelli, who, with another Florentine, Meo del Caprino, was one of the principal creators of the Renaissance style of Roman architecture, examples of which are S. Maria del Popolo (PL. 205), S. Agostino (FIG. 415), S. Pietro in Montorio, the Ponte Sisto, and the Ospedale di Sto Spirito. In the meantime Melozzo da Forlì was working in Rome and, between 1481 and 1483, Domenico Ghirlandajo, Botticelli, Cosimo Rosselli, Piero di Cosimo, Luca Signorelli, Perugino, and Pinturicchio were summoned to decorate the walls of the Sistine Chapel. Pinturicchio executed many other works in Rome in the course of the following decade. Mantegna (1488) and Filippino Lippi (1489–93) also spent some time in Rome. The results for local painting of all these arrivals and departures many be summed up in two names, that of Lorenzo da Viterbo and that of Antoniazzo Romano. The art of Lorenzo da Viterbo represents a mixture of the styles of Benozzo Gozzoli and Piero della Francesca (PL. 204). In the course of his long career, Antoniazzo Romano (whose initial preparation was similar to that of Lorenzo) felt successively

UP State Museum, Lucknow

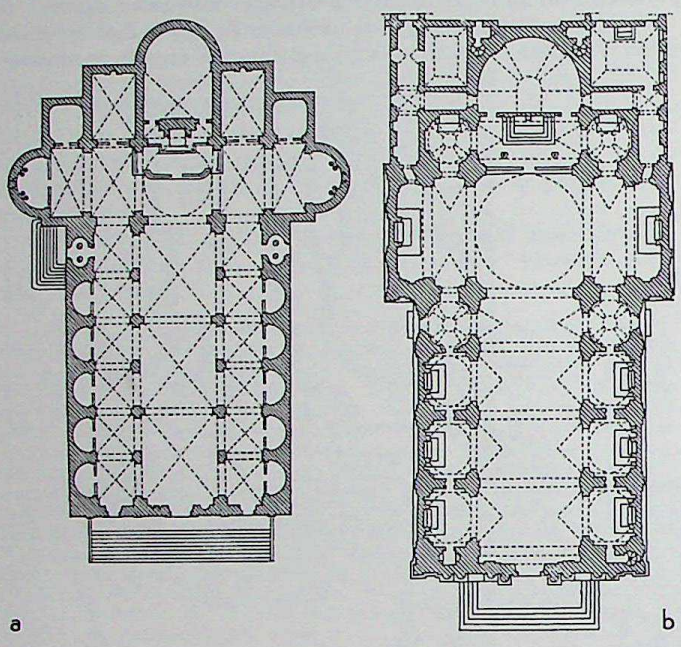
the influences of Melozzo, Ghirlandajo, and even Raphael. In Rome there are works of Antoniazzo in the Pantheon, in the Church of S. Maria sopra Minerva, and in the Vatican Museums (PL. 204). The Church of S. Giovanni Evangelista in Tivoli contains frescoes attributed to Antoniazzo.

Roman sculpture of the early 15th century is modestly represented by the work of Paolo Romano. But the Renaissance



a b

sculpture in Rome, represented by an abundant production of tombs and altars, was chiefly the work of Tuscan and Lombard masters. Donatello was in Rome in 1432–33, and Filarete executed his bronze doors for St. Peter's in 1433–45. At this time Isaia da Pisa, whose dry classicizing style was influenced by Michelozzo, settled in the city (PL. 205). Mino da Fiesole first went to Rome in 1463 and returned there after 1470. During his second stay, which lasted about ten years, he did some work in collaboration with Lombard sculptors, of whom the most important was Andrea Bregno. Against this background of mingled Tuscan and Lombard influences, there developed among the lesser men active in the production of funerary monuments a style sufficiently homogeneous to characterize a genuine school. Among these artists were Mino (Dino) del Reame (Regno), who also worked in Naples, and Giovanni Dalmata (Rome, 1460–80; later in Venice and Ancona). Gian Cristoforo Romano, the son of Isaia da Pisa, was a product of this artistic environment, but he soon left Rome to work in Ferrara, Pavia, and Mantua (1498–1505). Also in Rome were two other Lombards of classicizing tendency, Luigi di Giampietro Capponi, who was probably a pupil of Bregno, and the goldsmith and bronzeworker Cristoforo Foppa, known as Caradosso. A substantially higher level of creativity, however, was represented by the works in Rome of Antonio Pollaiuolo (q.v.; tombs of Sixtus IV and Innocent VIII).

At the end of the 15th century Castel Sant'Angelo was fortified (1492–95) by Antonio da Sangallo the Elder, and the Palazzo della Cancelleria was erected. The latter work has been variously attributed, and some credit part of the work to Bramante. It was under the aegis of Bramante, Raphael, and Michelangelo, all employed by Pope Julius II, that the transition from 15th- to 16th-century art occurred, the transition from the Florentine phase of the Renaissance to the Roman and European.

Volpe, Un'opera di Matteo Giovannetti, Paragone, X, 119, 1959, pp. 63–66). *Paolo Romano* (*Paolo Taccone*): active ca. 1451–77, sculptor (V. Leonardi, Paolo di Mariano Marmoraro, L'Arte, III, 1900, pp. 86–106, 259–74; Venturi, VI, 1908, pp. 1110–20). *Baccio Pontelli*: b. Florence, 1450; d. Rome, 1495; architect (P. Giordani, Baccio Pontelli a Roma, L'Arte, XI, 1908, pp. 96–112; E. Lavagnino, L'architetto di Sisto IV, L'Arte, XXVII, 1924, pp. 4–13).

THE EMILIAN SCHOOL FROM THE ROMANESQUE PERIOD TO THE 16TH CENTURY. Romanesque art in Emilia was influenced by that of Lombardy. The Cathedral of Modena (begun in 1099 by Lanfranco, who was probably from Como), which served as a model for the Abbey Church of Nonantola and the Cathedral of Ferrara (PL. 171), evidences this influence, as do religious edifices in Piacenza, Cremona, and Parma, cities that were also important because of the activity of Wiligelmo da Modena, Benedetto Antelami (qq.v.), and their schools.

In the Gothic period many non-Emilian architects and sculptors, including Nicola Pisano, Lapo, Arnolfo di Cambio,

and Guglielmo, were summoned to Bologna to work on the tomb of St. Dominic in the Church of S. Domenico (1264–67). In the 14th century the Dalle Masegne went to Bologna. (Pier Paolo dalle Masegne worked on an altar in the Church of S. Francesco there, 1388–92). Later, Jacopo Della Quercia went to Bologna to decorate the façade of S. Petronio (1435–38). Dominican and Franciscan churches were the principal productions of Gothic architecture in Emilia. The French features of the choir, ambulatory, and radial chapels of the 13th-century Church of S. Francesco in Bologna are noteworthy. Later, however, central Italian influence predominated, as evidenced by Antonio di Vincenzo's work for the Church of S. Petronio (1390), which was inspired by Florentine Gothic art. Venetian elements added soft touches of color to the loggia of the Palazzo della Mercanzia, and Gattapone (Matteo di Giovannello di Maffeo) was called from Gubbio to Bologna to work on the Collegio di Spagna. The Gothic tradition was continued in the work of the Bolognese architect Fioravante di Ridolfo Fioravanti, who designed part of the Palazzo del Comune (1425–28).

The schools of Rimini and Bologna provided several original developments in Emilian painting of the 14th century. From an originally Giottesque tradition and Sienese influences, the painters of Rimini created a style of great refinement (fragile architectural backgrounds, elongated figures, and delicate touches of color and ornament), which penetrated as far as the Marches

and the Veneto. These artists, prominent among whom were Pietro da Rimini and Giovanni Baronzio (PL. 180), painted such important fresco cycles as those in Pomposa (in the abbey refectory), Rimini (S. Agostino), Ravenna (S. Chiara), and Tolentino (the Chapel of St. Nicholas, S. Nicola da Tolentino).

Traditions of international culture centering in the university and the manuscript scriptorium that served it fostered a painting style that combined the Gothic sense of fantasy with acute observation of nature and human affairs. Vitale da Bologna (q.v.; VI, PL. 352) was the special master of this style in the first half of the 14th century. The problematical Dalmasio headed a movement receptive to Florentine culture in the second half of the 14th century. Contemporaneously, Jacopino de' Bavosi, who was initially inspired by the art of Rimini, opened the way to the spirited, folk-rooted expressionism of Bolognese painting, which persisted into the 15th century (especially in the art of Giovanni da Modena; VI, PL. 383). Bolognese art had some repercussions in Tuscany (where Barnaba da Modena worked; PL. 188). The art of Bologna also influenced the Veneto and, by the naturalism of the art of Tommaso da Modena (q.v.; VI, PL. 361), the entire Po Valley.

Fifteenth-century Emilian architecture turned to Tuscan models (the work of Alberti in Ferrara and Rimini; the Biblioteca Malatestiana in Cesena by Matteo Nuti, 1452; the Casa Isolani in Bologna by Pagno di Lapo Portigiani, a follower of Donatello, ca. 1455; the Cathedral of Faenza by Giuliano da Maiano, ca. 1476–86). In Bologna, however, Emilian architecture acquired a remarkably individual character by combining a certain majesty in construction with picturesque handling of ornamental brickwork and the use of ground-floor arcades (e. g., Palazzo Fava). Between 1470 and 1490 were constructed the two most important examples of Renaissance architecture in Bologna, the Palazzo del Podestà (whose reconstruction some attribute to a design of Aristotele di Fioravante di Ridolfo Fioravanti, who was later active in Moscow) and the Palazzo Bevilacqua. Elements in the latter (the rusticated exterior and the courtyard) recall aspects of the severest work of Biagio Rossetti of Ferrara, the architect and town planner of Ercole d'Este (Ferrara, the Palace of Ludovico il Moro; the Palazzo dei Diamanti: FIG. 417; the churches of S. Francesco, 1494, and of S. Maria in Vado, begun 1495). In Parma, a high point of 15th-century architecture was marked by Bernardino Zaccagni the Elder's Church of S. Giovanni Evangelista (PL. 200), which bears some similarity to the Cathedral of Faenza by Giuliano da Maiano. The Church of the Madonna della Steccata (1521–39; FIG. 419) by Zaccagni and his son Giovan Francesco, however, reveals the influence of Bramante. Alessio Tramello of Piacenza reflected a similar influence in the Church of the Madonna di Campagna (1522–28) and was probably in contact with the architectural circles of Rome, which also influenced the Bolognese palace architecture of this period (Palazzo Fantuzzi, 1517–32). The Palazzo Albergati is attributed to Baldassarre Peruzzi (q.v.), who worked in Carpi for the Pio family (from 1514). One of Peruzzi's Bolognese pupils, Sebastiano Serlio, marked the way for the development of 16th-century taste; his influence is apparent in the Palazzo dei Banchi by Vignola. Local 16th-century architects included Andrea da Formigine (Andrea di Pietro Marchesi) and Antonio di Bernardino Morandi, known as Terribilia (the cloister of S. Giovanni in Monte, 1545–48, now a prison; the Palazzo Marconi;

the Archiginnasio, 1562–63). Emilian architecture was also influenced by Pellegrino Tibaldi, who worked in Bologna, and Palladio, to whom are attributed the designs for the façade and courtyard of the Palazzo di Giustizia.

In sculpture, after Jacopo Della Quercia's heroic Humanist work for S. Petronio in Bologna, the impact of the Renaissance was felt in Ferrara in the work of the Florentine Niccolò Baroncelli (the horse of the monument to Nicholas III and the bronze figures of the Crucifixion, Ferrara, Cathedral, 1451) and the Paduan Domenico di Paris (statues in the Cathedral, 1466); the sculpture of both was a Paduan interpretation of Donatello. Agostino di Duccio worked as a young man in Modena in 1442; he worked for some years in Rimini (1447–54) and returned to Bologna in 1463. Francesco di Simone Ferrucci, who also worked in Forlì and Rimini, brought the Florentine type of tomb to S. Domenico in Bologna (Tartagni tomb, 1477). The Cathedral of Faenza houses the beautiful shrine of St. Terentianus (of undetermined attribution) and the shrine of St. Savinus by Benedetto da Maiano (1474–76). Thus, Florence provided the principal external influence on Emilian Renaissance sculpture, but its effects on local sculptors were limited until the appearance of Niccolò da Bari, known as Niccolò dell'Arca (after his work on the arca, or tabernacle, of S. Domenico in Bologna, 1469–73). Combining Tuscan and, later, Ferrarese influences with an essentially Franco-Burgundian cultural background, he produced a style of passionately intense expression that fitted easily into the Emilian tradition (e.g., a terra-cotta Pietà in S. Maria della Vita, Bologna). Based on Niccolò's art was that of Guido Mazzoni of Modena, who was noted for his life-size groups in polychrome terra cotta, scattered throughout Emilia and beyond (PL. 200). A somewhat vague Roman influence, with occasional Venetian elements, was manifested in the work of Alfonso Lombardi of Ferrara, who continued the Emilian terra-cotta tradition (*Death of the Virgin*, 1522, Bologna, Oratorio di S. Maria della Vita), and in that of Antonio Begarelli of Modena, who was partially influenced by Lombardi (many works in Modena). The effects of Florentine mannerism were seen in Bologna in Niccolò Tribolo's work on the side doors for S. Petronio, about 1530, and in Giambologna's reelaboration of classical motifs (*Neptune*, 1563; IX, PL. 308).

Ferrara was the center of the most vital and influential artistic developments in Emilian art of the 15th century. The Este court encouraged art by offering hospitality, in the period 1430–50, to such important painters as Pisanello, Jacopo Bellini, Piero della Francesca, Mantegna, and Rogier van der Weyden (qq.v.). Paduan culture influenced Bono da Ferrara and Ansuino da Forlì, who worked with Mantegna in the Church of the Eremitani in Padua, and filtered into the dramatic temperament of Cosmè Tura (q.v.), who was originally associated with the followers of Squarcione, as was Marco Zoppo of Bologna (PL. 197). The gloomy metallic splendor of Tura's paintings, expressions of intense visionary torment, was softened in the work of Francesco del Cossa (q.v.) into a crystalline limpidity that recalls Piero della Francesca. Cossa's art was followed by the sharp and elegant stylizations of Ercole de' Roberti (q.v.). The work of the Ferrarese artists Tura and Cossa dominated the Bolognese scene after 1470. Lorenzo Costa (PL. 201), initially one of their followers, was later influenced by Umbrian art and the uniform placidity of the style of Francesco Francia of Bologna (PL. 201); he worked primarily in Bologna. With these painters, another wandering Bolognese, Amico Aspertini, and the Modenese Francesco de' Bianchi-Ferrari, Emilian painting entered the 16th century.

Melozzo da Forlì achieved a solid synthesis of the lessons of Piero and Mantegna in Humanism and perspective. A contemporary of the three great Ferrarese, he worked chiefly in Rome, but also in Urbino, Loreto, Ancona, and Forlì. Melozzo's assistant, Marco Palmezzano, was influenced by Venetian culture. In Ravenna, Nicolò Rondinello and Lattanzio da Rimini followed Giovanni Bellini, while Bernardino and Francesco di Bosio Zaganelli worked in a belated 15th-century style.

The school of Ferrara retained its vitality in the 16th century through the work of Ortolano (Giovanni Battista Benvenuti) and Garofalo (Benvenuto Tisi; PL. 217), who were influenced by Venetian, Roman, and Cremonese art. Dosso Dossi (q.v.) was of greater importance, however. Combining the Ferrarese tradition with those of Venice and Brescia, his imagination, akin to that of the poet Ariosto, produced an art of magic and exorcisms, which he rendered in sumptuous color (PL. 212).

In the 17th century Parma dominated Emilian painting, as had Bologna in the 14th century and Ferrara in the 15th. In Parma flourished the luminous art of Correggio (q.v.), who figured among the great artists of the Renaissance and exerted a notable influence on later artists. Michelangelo Anselmi of Siena was noteworthy among Correggio's numerous followers. Parmigianino (q.v.), however, because of his originality and mannerist vigor, cannot accurately be numbered among the followers of Correggio, though he was fascinated by the latter's art and drew from it elements which he incorporated into the intellectual and somewhat anguished elegance of his own particular vision. Parmigianino expressed his vision with keen sensitivity in portraits and engravings (IV, PL. 428; X, PL. 388). The work of Girolamo Mazzola-Bedoli (IX, PL. 301) showed qualities of both Parmigianino and Correggio.

These two painters of Parma also influenced art in Bologna, freshening the stagnant environment created by mediocre painters such as Bagnacavallo (Bartolomeo Ramenghi). Parmigianino and Correggio revitalized the mannerist style, which absorbed contemporary Roman influences through Giulio Romano. Mannerism was subsequently taken to Fontainbleau by the Bolognese Francesco Primaticcio (1532) and later (1552) by his Modenese follower Niccolò dell'Abate (PL. 217; IV, PL. 415; IX, PLS. 299, 301). After Niccolò's departure, Pellegrino Tibaldi brought to Bologna the Michelangelesque style, displayed in his frescoes in the Archiginnasio and the Accademia delle Scienze (IX, PL. 298). Lelio Orsi, an imaginative mannerist painter of note, active in Reggio Emilia, depicted subtle artifices with dramatic luminosity (IX, PL. 301). His pupil Raffaello Motta (Raffaellino da Reggio) worked primarily in Rome.

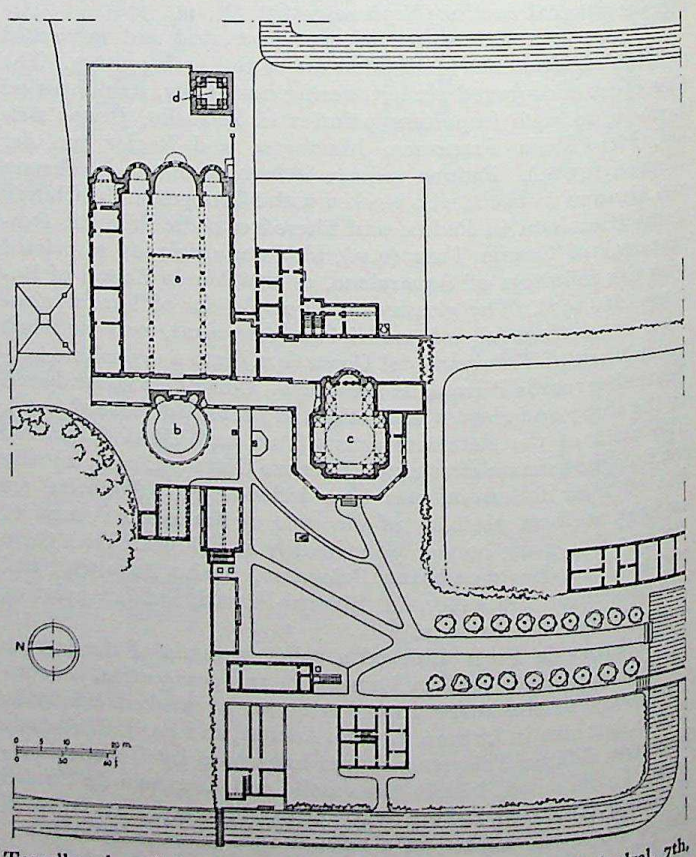
Fedele di Milano, Arte lombarda, III, 2, 1958, pp. 84–97; P. Rotondi, Ipotesi sui rapporti Cambiaso-Tibaldi, BArte, XLIII, 1958, pp. 164–70). *Bernardino Zaccagni the Elder*: 15th–16th-century architect (M. Salmi, Bernardino Zaccagni e l'architettura del Rinascimento a Parma, BArte, XII, 1918, pp. 85–109).

VENETIAN ART FROM THE ROMANESQUE PERIOD TO THE 16TH CENTURY. The geographical isolation of Venice and its maritime contacts with the Adriatic and the eastern Mediterranean fostered Venice's attachment to Ravennate and Byzantine styles and the coloristic, rather than modeled, treatment of architecture. While such Romanesque centers of the Venetian mainland as Verona reflected Lombard and Emilian architecture, S. Marco in Venice (11th cent.), the Cathedral in Murano, and S. Fosca in Torcello (PL. 174; FIG. 424) were uniquely Byzantine and eastern. A predilection for the airy spaciousness of porticoes and loggias, stilted arches, picturesque façade tracery, and chromatic decoration with marble and mosaics were continuing and characteristic elements of Venetian architecture.



Torcello, plan of the nucleus of medieval monuments. (*a*) Cathedral, 7th, 9th, and 11th cent.; (*b*) Baptistery, 7th cent.; (*c*) S. Fosca, 11th cent.; (*d*) Campanile, 9th cent. (*from B. Schulz, Torcello, Berlin, 1927*).

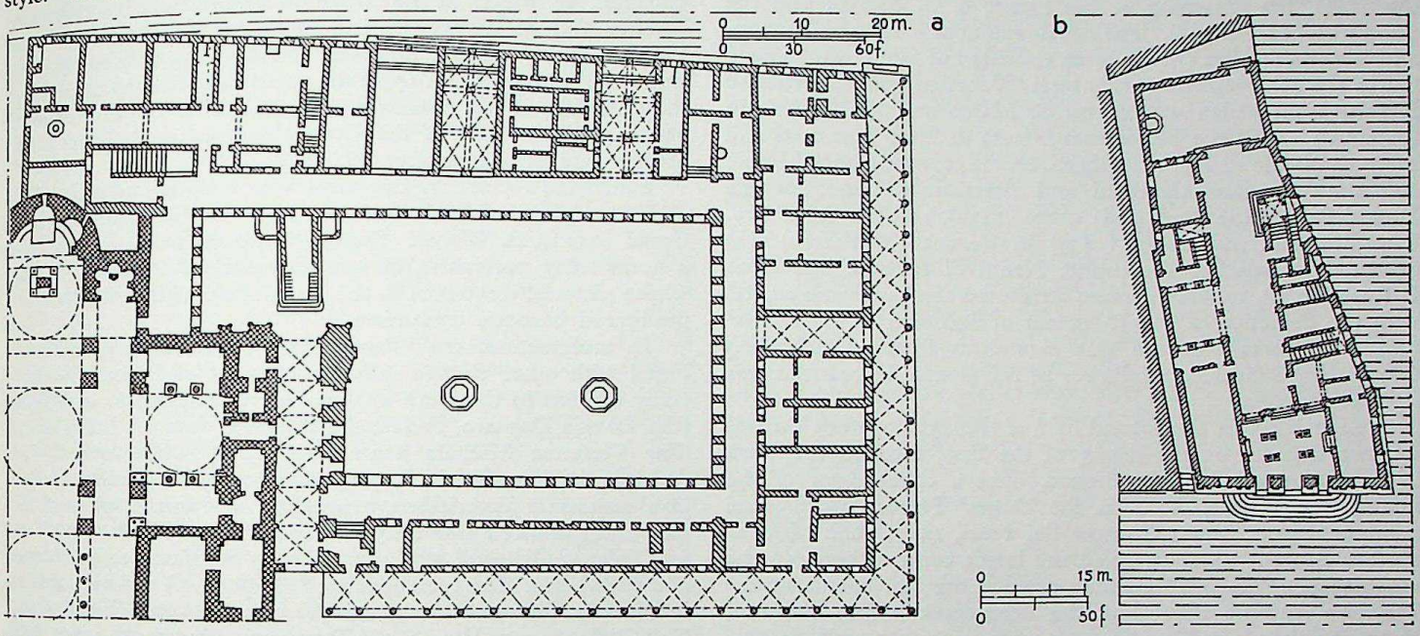
The 13th century marked the beginning of Venice's expansion into broader political and cultural relations with the rest of Italy and western Europe. But this was reflected before 1200, in the mosaics of S. Marco and the Cathedral of Torcello, and more clearly in the first half of the 13th century, in the expressionistic mosaics of the Passion of Christ and the Romanesque naturalistic scenes from Genesis. In the latest of these mosaics, a return to Byzantine feeling coincided with formal characteristics that became integral parts of the Gothic style. There was a comparable development in 13th-century Venetian sculpture (the main portal of S. Marco), in which elements deriving from Antelami were accompanied by classicizing Byzantine rhythms.



Venice. (*a*) Doges' Palace, plan of ground floor, 14th–15th cent.; (*b*) Palazzo Grimani (now Court of Appeals), plan of ground floor, begun 1556 (designed by Sanmicheli).

In the Gothic Church of S. Antonio in Padua (PL. 174) the northern European type of ambulatory with radiating chapels was combined with Venetian domes of eastern type. Wall surfaces of churches in Verona (S. Fermo Maggiore) and Treviso (S. Nicolò) were treated pictorially, an interpretation of the new Venetian style. The greatest monuments of this style in the 14th century were the Dominican Church of SS. Giovanni e Paolo (FIG. 379) and the Franciscan Church of S. Maria Gloriosa dei Frari in Venice. They are marked by clarity and solemnity in their expansive treatment of space. In secular architecture, the taste for administrative buildings with an arcade on the ground floor, a taste congenial to Venice, was given a chromatic interpretation in the extremely original Doges' Palace (FIG. 425; VI, PL. 340).

The isolationist and conservative tendencies of Venice were distinctly evident in its painting. Despite Giotto's activity in Padua, 14th-century Venetian painting did not participate in the Giottesque renewal and, at most, was only indirectly affected by it. Until past mid-century the aristocratic "Grecism" of Paolo Veneziano (VI, PL. 346) remained the most noble expression of Venetian painting (*Dormition of the Virgin*, Vicenza, Mus. Civ., 1333; cover of the Pala d'Oro, Venice, S. Marco, ca. 1345). Nevertheless, echoes of two styles eventually penetrated Venice — that of Emilia, and that of Tuscany. The Emilian current was centered in Treviso, and the Tuscan, based in Padua, was later augmented by the current stemming from Verona.

There was a reciprocal exchange of influences. In addition to masters from Rimini, artists who went north from Emilia were Vitale (who worked at the Cathedral in Udine and probably in the Dominican church in Bolzano), Tommaso da Modena (to Treviso), and Barnaba da Modena and Giovanni da Bologna (to Venice). Meanwhile Paolo Veneziano went south to Bologna (polyptych in S. Giacomo Maggiore), where he was later followed by Lorenzo Veneziano (1368) and Jacobello di Bonomo, who painted the polyptych in the Palazzo Comunale in Santarcangelo di Romagna (1385). These painters were the vanguard of the 14th-century extension of Venetian art along the Adriatic coast as far as Apulia. In the 14th–15th centuries, influences from northern Europe, another periodic "constant" in the artistic culture of the Venetian republic, were evident in the work of such Venetian artists as Niccolò di Pietro and Zanino di Pietro.

The artistic exchange between Padua and Venice was due principally to Guariento (PL. 188) and Nicoletto Semitecolo. The former was called from Padua to Venice to fresco the "Paradiso" in the Doges' Palace (1365–67). The latter went from Venice to Padua, where he painted the scenes from the life of St. Sebastian (Cathedral, 1367). Somewhat later, the work in Padua of the Florentine Giusto de' Menabuoi represented an infusion of Giottesque and Lombard influences, work characterized by a slow, grave monumentality (Baptistery, 1376). His counterpart may be considered Antonio Veneziano, who went to work in Tuscany (Pisa, Camposanto). Po Valley–Venetian art of the late 14th century is seen at its best in the creations of the Veronese Altichiero (q.v.), who worked in Padua; local Veronese painting was represented by Turone (polyptych, Mus. di Castelvecchio) and other minor artists.

The development of Venetian sculpture proceeded *pari passu* with that of Venetian civilization. Both responded slowly to the moods of the surrounding world and turned from the values of traditional archaism to late Gothic qualities. The end of the 14th century saw the appearance of Pier Paolo dalle Masegne's refined, ornately graceful style (altar in S. Francesco in Bologna, 1388–92) and the ruder force of his brother Jacobello (VI, PL. 368).

Through the middle of the 15th century, the Venetian area, within the framework of the extensive artistic complex of the Po Valley and Lombardy, participated in the International Gothic style, with particularly notable results in Veronese painting and Venetian stonework. Verona, in fact, was one of the foremost centers of late Gothic painting, because of the work of Pisanello (q.v.) and the Veronese master Stefano da Zevio (I, PL. 380; IV, PL. 269; VI, PL. 372). Stefano interpreted northern motifs in an Italianized idiom which approached the style of Gentile da Fabriano (q.v.). In Venice, Gentile (followed there by Pisanello about 1417) incorporated the most vital features of 14th-century Po Valley painting (Tommaso da Modena and Altichiero) with the new International style and exer-

cised a determining influence on this area of Venetian painting, which included Jacobello del Fiore (scenes from the life of St. Lucy, Fermo, Pin.) and Michele Giambono (painting of St. Chrysogonus, Venice, S. Trovaso).

Contemporaneously, the artists in stone, who generally were masters both in sculpture and architecture as complementary elements in a single decorative enterprise, created the "flowery" style typical of Venice's taste for pictorial values. Fine examples of this style are the decoration of the Doges' Palace (begun at the beginning of the 15th century and continued well into the 16th), the crowning of the façade of S. Marco, and the Ca' d'Oro (VI, PL. 338). The collaboration of Lombard, Tuscan, and Venetian artists (which often consisted of family workshops) led to the achievement of this total "Venetian quality." Matteo Raverti from Milan worked on S. Marco and the Ca' d'Oro (begun in 1421); the Florentines Nicolò di Piero Lamberti and Piero di Nicolò di Piero Lamberti, on the crowning of S. Marco; and the Venetians Giovanni and Bartolomeo Bono, on the Doges' Palace, the Porta della Carta (1438), and the Ca' d'Oro. The Brenzoni monument (1427) in Verona (S. Fermo) was executed by another Florentine, Nanni di Bartolo, known as Il Rosso (q.v.), to whom is also attributed the handsome capital with the depiction of the Judgment of Solomon in the Doges' Palace. (Others attribute this capital to Pietro Lombardo.) Giorgio da Sebenico, a follower of the Bonos, introduced this style to Ancona.

Venetian art in the second half of the 15th century thrived for two decades on the legacy of the first, through the work of the Lombard Antonio Bregno, once a collaborator of the Bonos (the Foscari Arch in the Doges' Palace; the Foscari monument in S. Maria Gloriosa dei Frari, 1457, done with his brother Paolo). Later emerged the latent contrast between the substantially "modern" attitude of such original talents as the Veronese Antonio Rizzo and the Bergamask Mauro Coducci, on the one hand, and, on the other, the more narrowly decorative attitude that was adopted by Pietro Lombardo and his sons Antonio and Tullio. The latter view evoked the description "Lombardesque" as applied to the precious and traditionalist, though superficially Renaissance, style of such buildings as the Palazzo Dario (PL. 198) and the Church of S. Maria dei Miracoli (1489). Such works as the Foscari Arch in the Doges' Palace and the side of the court with the Scala dei Giganti united these artists — from Bregno to Rizzo (the Arch), from Rizzo to Pietro Lombardo (the Scala; PL. 198) — in a stylistic continuity. Rizzo (the tomb of Doge Nicolò Tron; PL. 198) and Bregno received their artistic initiation in Lombardy at the Certosa of Pavia; Rizzo, who was also sensitive to the plastic rigor of pure Renaissance forms, executed the extremely beautiful statues of Adam and Eve in the Foscari Arch. In contrast, Pietro Lombardo sought an analytical and decorative finesse (Malipiero and Mocenigo monuments, ca. 1480, in SS. Giovanni e Paolo), as did his son Tullio in the overly renowned statue of Guidarello Guidarelli (1525, Ravenna, Acc.).

Donatello's (q.v.) activity in Padua contributed to the creation of a particular style in sculpture, elements of which have been credited to Andrea Mantegna (q.v.). Agostino dei Fonduti, later active in Milan, was trained in this sculptural style. Donatello's influence is evident in the pictorial qualities of Niccolò Pizzolo's work (e.g., the terra-cotta altar, Padua, Church of the Eremitani) and in that of Bartolomeo Bellano, who interpreted Donatello's sense of drama with a noble, expressionistic freedom (Padua, reliefs in S. Antonio; Roccabonella monument in S. Francesco, 1498). In the 16th century, Andrea Briosco, known as Riccio, expressed the naturalistic vein of the Paduan ambient in his small mythological bronzes inspired by antiquity.

Mauro Coducci's architecture was unique. It authentically affirmed the Venetian version of the sculptural and spatial concepts of the Tuscan Renaissance and assimilated derivations from Michelozzo and Alberti (S. Michele all'Isola, begun 1469, PL. 198; FIG. 392; S. Maria Formosa, begun 1492; S. Giovanni Crisostomo; the Corner Spinelli and Vendramin Calergi palaces, both ca. 1500, where the traditional loggia ambulatories were replaced by twin-arched windows). The traditional, conservative "picturesque" style survived in the 16th-century work in the court of the Doges' Palace and, later, in the Procuratie Vecchie (1514) and the Scuola di S. Rocco (begun in 1517) by Bartolomeo Bono the Younger. A fugitive from the sack of Rome in 1527, the Florentine Jacopo Sansovino, gave the needed impetus to the development of 16th-century Venetian architecture and became the dominant figure there, as both architect and sculptor. His light and serene classicism was innately disposed to merge with the pictorial qualities of the Venetian tradition, to which he imparted an organic clarity and consistency full of movement and elegance (S. Francesco della Vigna; Palazzo Corner, now Ca' Grande, 1537; Libreria Vecchia di S. Marco, begun 1536; the small loggia of the campanile; the sculpture of the Madonna and the reliefs for the loggetta, 1540–45; the statues of the Evangelists inside S. Marco; the bronze gate of the sacristy, PL. 214).

Sansovino's pictorial luminism was adapted to such mannerist sculpture as the reliefs of Tiziano Minio for the baptismal font in S. Marco. Danese Cattaneo from Carrara was a noteworthy portraitist, as was Alessandro Vittoria of Trent, whose pictorial eloquence in the second half of the 16th century prefigured baroque dynamism.

In architecture, the "Romanism" of Sansovino was combined with other Roman influences. That of Peruzzi is especially evident in the work of Gian Maria Falconetto of Verona (the Loggia Cornaro, Padua; the Villa dei Vescovi, Luvigliano). The Veronese Michele Sanmicheli (q.v.), who worked with Antonio da Sangallo the Younger in Rome, later followed Serlio's mannerist pictorialism, expressing an original spirit of elegant and measured solemnity (Verona, Palazzo Bevilacqua; Venice, Palazzo Grimani, FIG. 425; military fortifications in Verona and elsewhere). The great Andrea Palladio (q.v.) and his academic disciple Vincenzo Scamozzi (Vicenza, Palazzo Trissino dal Velo d'Oro, 1577; Venice, the Procuratie Nuove, PL. 214; Sabbioneta, the Theater, 1589) worked in Vicenza.

The 15th century saw the beginning of the exceptional development of Venetian painting that made Venice, along with Florence and Rome, one of the great centers of European painting. The International Gothic of Gentile da Fabriano and Pisanello was enriched by a curiosity toward nature and its depiction in the art of Jacopo Bellini and Antonio Vivarini (qq.v.), the heads of their respective family workshops in Venice and Murano. Paolo Uccello (q.v.) worked in Venice for five years (1425–30), but his early productions exerted little influence at that time. Andrea del Castagno (q.v.) was in Venice in 1442, and his work influenced later Venetian artists.

The city that was most open to Renaissance influence was Padua. Its tradition of cultural interchange with Tuscany, so notable in the 14th century, was revitalized in the 15th century by the Florentine exile Palla Strozzi and the work in Padua of Filippo Lippi, Paolo Uccello, and Donatello (qq.v.). The curious Francesco Squarcione was important as a teacher and impresario of young talent (PL. 197). The young Andrea Mantegna was an apprentice in Squarcione's workshop before becoming the great and solemn innovator of Po Valley and Venetian painting. Squarcione's imprint was evident in the agitated sharp figures of Marco Zoppo and Giorgio Schiavone and, to a lesser degree, in the work of Tura of Ferrara and the Venetian Carlo Crivelli (q.v.). Crivelli brought from Padua and Murano to the Marches (where he worked after 1467) the piercing Neo-Gothic perfection of his almost carved and enameled surfaces.

Mantegna's "form" was influential throughout the Veneto (as well as in Lombardy and Emilia) and became the basic theme for a succession of variations. In the school of Murano, it was combined with the taste for almost sculptural design and vitreous color that derived from Andrea del Castagno. This development can be seen in the work of Bartolomeo Vivarini, the brother of Antonio (PL. 197). Influenced by Piero della Francesca's (q.v.) achievements in the treatment of space and color and by the work of Antonello da Messina, Giovanni Bellini (qq.v.) also adapted Mantegna's form. Thus, Mantegna's influence on Venetian painting was assimilated by Giovanni Bellini, who influenced other artists. This particular combina-

tion affected the Muranese and Veronese schools as well as the undistinguished Paduan painter Jacopo da Montagnana. In contrast, Antonello's influence followed its own particular course (affecting Alvise Vivarini and his colleagues), only partially uniting with that of Bellini in a complex knot of relationships and results. Paralleling Antonello's influence was that of the "narrative" vein of Venetian painting originated by Gentile Bellini (q.v.) and carried to great lyric heights by Carpaccio (q.v.).

Fifteenth-century painting in the Veneto presents several aspects. In Padua the trend following Mantegna was vulgarized by Bernardo Parentino (Parenzano). In Venice the style of Bellini was further developed in the work of Francesco Bissolo and other minor painters, although it was colored intermittently by the styles of Vivarini and Giorgione, evident in the work of Vincenzo Catena and the Bergamask Andrea Previtali. Such other artists as Lazzaro di Jacopo Bastiani and Giovanni Mansueti (PL. 199) collaborated in the large canvases of Giovanni Bellini. The formalist disciples of Antonello, however, constituted the most important segment of 15th-century Venetian painting. Their limpid manner of rendering figures was in opposition to the atmospheric tonalism of Giorgione and Giovanni Bellini. In addition to Alvise Vivarini (the son of Antonio), considered the initiator of this tendency after Antonello, the group included such talented painters as Cima da Conegliano (q.v.; PL. 199), the less renowned Marco Basaiti (PL. 199), and the Vicentines Bartolomeo Montagna and Giovanni Buonconsiglio, known as Marescalco. In Verona the local school, including Francesco Benaglio, Domenico (VII, PL. 275) and Francesco Morone (influenced by Bellini), Francesco Bonsignori, Girolamo dai Libri, and Liberale da Verona (Liberale di Jacopo dalla Brava), remained faithful to the tradition of Mantegna. The Carnia region also had a school of local artists, working in a Paduan-Muranese style. The most important of these painters was Gian Francesco da Tolmezzo (Giovanni Francesco dal Zotto), who painted frescoes and polyptychs in churches in Friuli.

While Bellini and Carpaccio were still at the height of their activity, Giorgione was blending color and light into a unified atmospheric vision. "Tonal" color became, in the first decade of the 16th century, the typical expressive means of Venetian painting, which in its naturalist inclination (man immersed in nature considered as a poetic element of landscape) is quite distinct from the Tuscan and Roman concentration on form (the human figure considered as a monument that dominates space). Despite their opposite natures, these two viewpoints met in a series of reciprocal influences. The Florentine Fra Bartolommeo (q.v.) worked in Venice in 1508, while one of Giorgione's collaborators, Sebastiano del Piombo, went to Rome, where after 1511 he acquired a style of stately monumentality. The complex artistic style of Giovanni Antonio da Pordenone (IX, PL. 302) derived originally from the school in the Friuli of Gian Francesco da Tolmezzo and Pellegrino da San Daniele. Later Pordenone studied the Roman style and accentuated its dynamism by contrasts of color and light, achieving results which anticipated future artistic developments. Apart from the Roman elements, Venetian painting of the beginning of the 16th century displayed a taste for Flemish and German art, which was nurtured especially by prints from northern Europe. Moreover, Dürer himself (q.v.) lived for a time in Venice, where in 1506 he painted an altar screen for the Church of S. Bartolomeo (IV, PL. 296). Northern taste was also evident in the work of such minor artists as Bartolomeo Veneto, Marco Marziale, Benedetto Diana, and, especially, Jacopo de' Barbari, and it became an element of the art of the great "irregular" of Venetian art, Lorenzo Lotto (q.v.), and the Brescian painters.

In the meantime Titian's (q.v.) art triumphed in Venice. Derived from Giorgione's intimate naturalism, though dramatically extrovert and heroic, Titian's art was the expression of a temperament overflowing with vitality. Several artists continued rather strictly to follow the style of Giorgione; among them were the Campagnolas (in particular, Giulio, a fine engraver), Domenico Mancini, and the Veronese Francesco Torbido known as Il Moro (later responsive to Roman influences). But the combined style of Titian and Giorgione extended its influence throughout the Veneto, which included Bergamo, where Palma Vecchio (q.v.), famous for his paintings of the Madonna and saints, Bernardino Licinio, and Giovanni de' Busi, known as Cariani (VI, PL. 67), worked. This influence penetrated Brescia as well, though Brescian art showed greater independence of artistic idiom, albeit related to Lombard taste.

In the middle of the 16th century a second, decidedly mannerist wave of "Romanism" reached Venice. One of the artists principally responsible for this was Giulio Romano, who had recently worked in Mantua. Before 1530 Il Rosso, followed by Francesco Salviati (VII, PL. 268; IX, PL. 309) and Giovanni da Udine in 1539, carried this trend to Venice itself. Giorgio Vasari worked in Venice in 1541, while Titian was summoned to Rome in 1545 by Paul III. And minor Venetian artists, such as Giovanni Battista Franco (IX, PL. 300), were assimilated among the followers of Michelangelo in Rome. Mannerist elements appeared in the mature work of some painters who initially had been followers of Titian or Palma, among whom were Paris Bordone of Treviso and Bonifazio Veronese (Bonifazio di Pitati; PL. 213). Parmigianino's mannerism also influenced Venetian painting and inspired Andrea Meldolla, known as Lo Schiavone, who dissolved Parmigianino's style in fluid, chromatic, and luminous vibrations. Mannerism was formally resumed by Tintoretto in the chiaroscuro key and by Jacopo Bassano (qq.v.) in a chromatic key. In his mannerist use of form Paolo Veronese (q.v.) was related to Tintoretto and Bassano. But, in contrast to Tintoretto's abstract luminism and Bassano's profound, earthy chromaticism, Veronese affirmed his own limpid, solar vision, thus culminating 16th-century Venetian painting on a classic note, parallel to Palladio's architectural development.

The schools of these masters acquired a family character through the extensive activity of their relatives (in addition, of course, to their other followers); thus Titian with Francesco, Cesare, and Marco Vecellio; Tintoretto with his children, Domenico and Marietta; Bassano with his sons Francesco, Leandro, and Girolamo; Veronese with his son Carlo Caliari and other relatives. In Verona, the local school, which had passed from Mantegna's to Giorgione's influence, assimilated Roman elements in the art of Giovanni Francesco Caroto and Torbido, and assumed the imprint of the decorative quality of the art of Paolo Veronese (as exemplified in the villas of the Veneto) in the work of such minor artists as Giambattista Zelotti (PL. 214) and Giovanni Antonio Fasolo from Vicenza. Although Palma Giovane (PL. 214) sometimes worked with distinction, Venice entered into the decadence of a mannered local eclecticism that was continued in the 17th century by the dull academic production of Alessandro Varotari, known as Padovanino. From the currents of influence of Tintoretto and the Bassanos, however, emerged two original painting phenomena — the work of Jacopo Mariscalchi of Feltro and the vastly more ambitious and important work of Domenico Theotocopuli, known as El Greco (q.v.).

Biscaro, Della vita e delle opere di Paris Bordone, Treviso, 1900; M. Muraro, Un ciclo di affreschi di Paris Bordone, Arte veneta, IX, 1955, pp. 80–85). *Giovanni Buonconsiglio*, known as *Marescalco*: 15th–16th-century painter (A. Foratti, Di alcuni quadri inediti di Giovanni Buonconsiglio, BArte, XII, 1918, pp. 70–80; A. Martini, Spigolature venete: Bartolomeo Montagna e Giovanni Buonconsiglio, Arte veneta, XI, 1957, pp. 60–61). *Caliari*: a family of Veronese painters active during the 15th–16th centuries, including *Carlo* (G. Gamulin, Contributi al Cinquecento, Arte veneta, XIII–XIV, 1959–60, pp. 88–95). *Campagnola*: a family of artists active during the 15th–16th centuries, including *Domenico* (G. Fiocco, La pittura bresciana del Cinquecento a Padova, BArte, N.S., VI, 1926–27, pp. 305–23; T. E. Mommsen, Petrarch and the Decoration of the Sala Virorum Illustrium in Padua, AB, XXXIV, 1952, pp. 95–116), *Girolamo* (S. de Kunert, Due codici miniati da Girolamo Campagnola?, RArte, XII, 1930, pp. 57–80), and *Giulio* (K. F. Suter, Giulio Campagnola als Maler, ZfbK, LX, 1926–27, pp. 132–41; U. Middeldorf, Eine Zeichnung von Giulio Campagnola?, Festschrift Martin Wackernagel, Cologne, 1958, pp. 141–52). *Cariani* (*Giovanni de' Busi*): Venice, 1485–1547 (A. Foratti, L'arte di Giovanni Cariani, L'Arte, XIII, 1910, pp. 177–90; L. Gallina, Giovanni Cariani: Materiale per uno studio, Bergamo, 1954). *Caroto*: a family of Veronese painters, including *Giovanni Francesco*, 1480–1555 (L. Simeoni, Nuovi documenti sul Caroto, L'Arte, VII, 1904, pp. 64–67; B. Baron, Giovanni Caroto, BM, XVIII, 1910–11, pp. 41–44, 176–83; A. Avena, Giovan Francesco Caroto e Battista Zelotti alla corte di Mantova, L'Arte, XV, 1912, pp. 205–08). *Vincenzo Catena*: Venice, 1470–1531, painter (G. Robertson, Vincenzo Catena, Edinburgh, 1954). *Danese Cattaneo*: b. Colonnata, 1509; d. Padua, 1573; sculptor (G. Campori, Danese Cattaneo, Il Buonarroti, VI, 1871, pp. 149–62; E. Delmar, "The Nuptials of Peleus and Thetis" by Danese Cattaneo, GBA, XXVII, 1945, pp. 347–56). *Mauro Coducci*: b. Lenna, 1440; d. Venice, 1504; architect (L. Angelini, Le opere in Venezia di Mauro Coducci, Milan, 1945). *Benedetto Diana*: late-15th-century Venetian painter (G. Ludwig, Archivalische Beiträge zur Geschichte der venezianischen Malerei: Benedetto Diana, JhbPreussKSamml, XXVI, 1905, sup., pp. 56–61; G. Mariacher, Il restauro del Cristo in Pietà attribuito a Benedetto Diana, B. Mus. Civ. Veneziani, 1958, 1, pp. 25–33). *Marcello Fogolino*: doc. 1480–1518, painter (P. Zampetti, Affreschi inediti di Marcello Fogolino, Arte veneta, I, 1947, pp. 217–22; P. Zampetti, Precisazioni sull'attività trentina di Marcello Fogolino, BArte, XXXIV, 1949, pp. 218–24). *Francesco dei Franceschi*: doc. 1443–68, painter (E. Arslan, Intorno a Giambono e a Francesco dei Franceschi, Emporium, LIV, 1948, pp. 285–89). *Michele Giambono*: doc. ca. 1420–62, painter (E. Sandberg-Vavalà, Michele Giambono and Francesco dei Franceschi, BM, LI, 1927, pp. 215–21; V. Moschini, Nuovi aspetti di opere famose, BArte, XXXIV, 1949, pp. 162–70). *Gian Francesco da Tolmezzo*: see *Tolmezzini*. *Giorgio da Sebenico*: d. 1475, architect and sculptor (D. Frey, Der Dom von Sebenico und sein Baumeister Giorgio Orsini, Jhb. der Zentralkomm., VII, 1913, pp. 1–169; G. Praga, Documenti su Giorgio da Sebenico, architetto e scultore del secolo XV, Arch. storico della Dalmazia, XII, 1932, pp. 523–31; R. Petrovitch, Questi Schiavoni, III: Giovanni Duknovich and Giorgio da Sebenico, GBA, XXXII, 1947, pp. 143–50; C. Bima, Giorgio da Sebenico, la sua cattedrale e l'attività in Dalmazia e in Italia, Milan, 1954). *Girolamo dai Libri*: Verona, 1474–1555, painter and miniaturist (A. Forti, Francesco Morone e Girolamo dai Libri, Madonna Verona, XIV, 1920, pp. 57–172; R. Wittkower, Studien zur Geschichte der Malerei in Verona, III: Der Schüler des Domenico Morone, Jhb. für Kw., 1927, pp. 185–222; G. Fiocco, Una miniatura di Girolamo dai Libri, Arte veneta, VII, 1953, p. 163). *Guariento*: doc. 1338–70, Paduan painter (L. Coletti, Studi nella pittura del Trecento a Padova, I: Guariento e Semitecolo, RArte, XII, 1930, pp. 323–80; R. Longhi, Guariento: Un'opera difficile, Paragone, VIII, 91, 1957, pp. 37–40; F. D'Arcais, Un'altra cappella dipinta dal Guariento agli Eremitani di Padova, Arte veneta, XIII–XIV, 1959–60, pp. 189–91). *Jacopo de' Barbari*: b. Venice (?), ca. 1440; d. Malines, 1516; painter and engraver (L. Servolini, Jacopo de' Barbari, Padua, 1944; C. Gilbert, Ancora di Jacopo de' Barbari, Comm, VIII, 1957, pp. 155–56). *Jacobello del Fiore*: d. Venice, 1439, painter (G. Fiocco, Segnalazioni venete nel Museo di Kieff, Arte veneta, XII, 1958, pp. 31–37). *Liberale da Verona* (*Liberale di Jacopo dalla Brava*): 1445–ca. 1526, painter and miniaturist [R. Brenzoni, Documenti inediti e tavole sconosciute (o quasi) di M. Liberale da Verona, L'Arte, N.S., XIX, 1954, pp. 9–19; R. Longhi, Un apice espressionistico di Liberale da Verona, Paragone, VI, 65, 1955, pp. 3–7; C. del Bravo, Liberale a Siena, Paragone, X, 129, 1960, pp. 16–38]. *Bernardino Licinio*: ca. 1489–1565, Venice, painter (A. Martini, Spigolature venete: Licinio e Tiziano, Arte veneta, XI, 1957, pp. 62–64; C. Boselli, Un Licinio nel Duomo di Lonato, Arte veneta, XII, 1958, pp. 195–96). *Lombardo*: a family of Lombard sculptors and architects active during the 15th–16th centuries (L. Planiscig, Pietro, Tullio und Antonio Lombardo, JhbKhSammlWien, N.S., XI, 1937, pp. 87–115; G. Mariacher, Tullio Lombardo Studies, BM, XCVI, 1954, pp. 366–74; G. Mariacher, Pietro Lombardo a Venezia, Arte veneta, IX, 1955, pp. 36–52). *Lorenzo Veneziano*: painter, doc. 1346–79 (M. Caffi, Lorenzo da Venezia ed altri pittori veneti antichi, Arte e storia, V, 1886, pp. 201–03; R. Longhi, Calepino veneziano, II: Il trittico di Lorenzo Veneziano per l'Ufficio della Seta (1371), Arte veneta, I, 1947, pp. 80–85). *Marco Marziale*: late-15th-century Venetian painter (B. Geiger, Marco Marziale und der sogenannte nordische Einfluss in seinen Bildern, JhbPreussKSamml, XXXIII, 1912, pp. 1–22, 122–48; A. Bertini, Un dipinto poco noto di Marco Marziale, Arte veneta, XI, 1957, pp. 200–02). *Jacobello* and *Pier Paolo dalle Masegne*: Venetian sculptors, doc. 1383–1409 (C. Gnudi, Jacobello e Pietro Paolo da Venezia, CrArte, II, 1937, pp. 26–38; C. Gnudi, Nuovi appunti sui fratelli dalle Masegne, Proporzioni, III, 1950, pp. 48–55).

Valcanover, Contributo a Gianfrancesco da Tolmezzo, Arte veneta, IX, 1955, pp. 29–35). *Francesco di Marco India Torbido*, called *Il Moro*: Verona, ca. 1482–1562, painted (D. Viana, Francesco Torbido detto il Moro: Pittore veronese, Verona, 1933). *Turone*: Veronese painter, active ca. 1360 (E. Sandberg-Vavalà, Turone miniatore, Dedalo, X, 1929–30, pp. 15–44; F. Zeri, Una "Annunciazione" di Turone, Paragone, VIII, 89, 1957, pp. 48–52; E. Arslan, Una tavola di Altichiero e un affresco di Turone, Comm, XI, 1960, pp. 103–06). *Alessandro Varotari*, called *Padovanino*: b. Padua, 1588; d. Venice, 1648; painter (V. Moschini, Alcuni dipinti nei depositi demaniali di Venezia, Riv. di Venezia, XII, 1933, pp. 231–44; C. Semenzato, Un Padovanino ed un Celesti in Puglia, Arte veneta, XI, 1957, pp. 213–15; K. Prijatelj, Le opere di Padovanino in Dalmazia, Arte veneta, XIII–XIV, 1959–60, pp. 204–06). *Vecellio*: family of painters from Pieve di Cadore, active in Venice during the 16th century (Catalogo della mostra dei Vecellio a Belluno, Belluno, 1951). *Alessandro Vittoria*: b. Trent, 1524; d. Venice, 1608; sculptor (W. R. Valentiner, Alessandro Vittoria and Michelangelo, AQ, V, 1942, pp. 149–57; G. Zorzi, Alessandro Vittoria a Vicenza e lo scultore Lorenzo Rubini, Arte veneta, V, 1951, pp. 141–57; K. Prijatelj, Alessandro Vittoria e la Dalmazia, Arte veneta, XII, 1958, pp. 205–07). *Giambattista Zelotti*: b. Verona, 1526; d. Mantua, 1578; painter (A. Venturi, Giambattista Zelotti, L'Arte, XXXII, 1929, pp. 49–67; E. Arslan, Nota su Veronese e Zelotti, Belle Arti, I, 1946–48, pp. 227–45; G. Gamulin, Contributi al Cinquecento, Arte veneta, XIII–XIV, 1959–60, pp. 88–95).

ROMAN ART FROM THE PONTIFICATE OF JULIUS II TO THE END OF THE 18TH CENTURY. The creative splendor resulting from the immense artistic activity that centered around the papal court had its beginning in the art of Bramante, Raphael, and Michelangelo (qq.v.) and made of Rome a capital of European art for more than two centuries. Rome's power of attraction and diffusion in the field of art became steadily stronger and more evident. A true picture of Roman art in this period requires not only a disregard of merely local and regional considerations but often demands a viewpoint that goes beyond Italy to include, for example, French and Flemish artists.

Together with Bramante and Raphael (the two great artists of the early 16th century), Baldassarre Peruzzi and Antonio da Sangallo the Younger (qq.v.) were leaders in the Roman school of architecture. The architectural activities of Michelangelo in Rome followed the death of Sangallo (1546) and were contemporaneous with the first works of Vignola (q.v.). The architect of the Church of the Gesù (begun 1568), Vignola belonged to the second phase of 16th-century Roman art, which was concerned with the political and spiritual objectives and the expression of the ideals of the Counter Reformation. Related to the work of Michelangelo and Vignola was that of the Lombard Giacomo della Porta (Rome; façade of S. Luigi dei Francesi; Madonna dei Monti; S. Atanasio; Palazzo della Sapienza, 1579; Frascati, Villa Aldobrandini, 1598–1602). Della Porta also collaborated in the execution of works designed by Michelangelo and Vignola (dome of St. Peter's, façade of the Church of the Gesù, IX, PL. 312) and set his stamp on Roman architectural taste in the late 16th century. One of his contemporaries, Domenico Fontana, another Lombard and the architect of Sixtus V, was the principal creator of the city plan of Rome, which is essentially the plan of the modern city and features streets connecting the large basilicas and obelisks and fountains forming the directrixes of vistas. Fontana was also the architect of the Cappella Sistina (or, del SS. Sacramento) in S. Maria Maggiore and the papal palaces of the Quirinal and the Lateran. From these main currents emerged the baroque conception of church and palace structures, which long retained its influence on the development of architecture. The development of villas and gardens was also important for baroque style (see LANDSCAPE ARCHITECTURE). In the Villa Giulia, Rome, the Villa d'Este, Tivoli (PL. 432; IX, PL. 313), and the Casino of Pius IV, in the Vatican Gardens (PL. 429; FIG. 413), ideas drawn from Bramante, Raphael, Peruzzi, and the writings of Sebastiano Serlio were developed in refined mannerist forms. Because of their fusion of architecture and nature, landscape and scenography, these villas and gardens also anticipated succeeding architectural developments.

Roman architecture in the late 16th century was completely dominated by Lombard artists; Martino Longhi the Elder, his son Onorio, and his grandson Martino the Younger (who lived in the 17th century) formed a virtual dynasty of Lombard architects (PL. 207; S. Girolamo degli Schiavoni, 1587; Palazzo Borghese). Martino the Elder was a follower of Giacomo della Porta, while Flaminio Ponzio was inspired by Fontana (façade of Palazzo Sciarra-Colonna; Cappella Paolina in S. Maria Maggiore, 1605–11). Ottaviano Mascherino (PL. 207) established the prototype of the two-story façade in his Church of Sto Spirito and was as notable an architect as he was insignificant a painter. In the work of the Lombard Carlo Maderno (q.v.; II, PLS. 132, 137) and Girolamo Rainaldi, a Roman follower of the Lombard architects, this late mannerism or early baroque became truly 17th-century work.

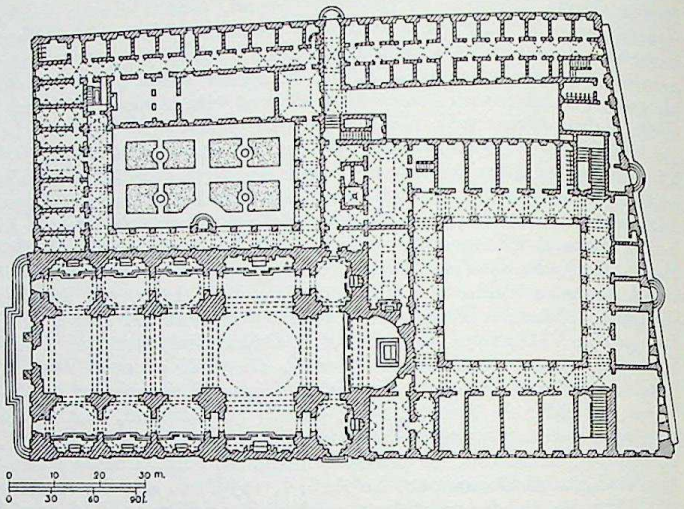
Roman sculpture at the beginning of the 16th century was dominated by Tuscan masters, even without considering the supreme figure of Michelangelo, whose influence was widespread for decades. Andrea (Contucci) Sansovino (q.v.) brought to Rome his decorative classicism, a style unaffected by the emotion of the school of Michelangelo (IV, PL. 455; work in S. Agostino); Andrea's pupil Jacopo (Tatti) Sansovino showed a taste for pictorial handling of sculpture (work in S. Agostino;

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

PL. 206), which he was to develop further in Venice, where he settled after the sack of Rome (1527). Of the many other Tuscans who worked in Rome, the most important were Lorenzetto (Lorenzo di Ludovico di Guglielmo Lotti), Raffaello (Sinibaldi) da Montelupo, Baccio Bandinelli (tombs of Leo X and Clement VII in S. Maria sopra Minerva), Vincenzo di Raffaello (de') Rossi (Cesi Chapel in S. Maria della Pace), Ammanati (q.v.; Del Monte tombs, 1553, S. Pietro in Montorio), and Taddeo Landini (PL. 206). The Lombard sculptor Guglielmo della Porta (PL. 208) was a follower of Michelangelo. Numerous minor Lombard sculptors, including Nicolas Cordier, a Frenchman from Lorraine, Giovanni Antonio Paracca, known as Valsolda, and Pietro Bernini (PL. 208), the father of Gian Lorenzo, often worked with architects on the sculptural decoration of tombs (e.g., those in the Aldobrandini Chapel, S. Maria sopra Minerva, by Giacomo della Porta), and chapels (e.g., S. Maria Maggiore, Cappella Sistina, by Domenico Fontana, and Cappella Paolina, by Flaminio Ponzio). Other sculptors involved in these enterprises were Stefano Maderno, the sculptor of the famous statue of St. Cecilia in the Church of S. Cecilia in Trastevere, and Camillo Mariani of Vicenza (II, PL. 164). The work of these men and, even more, that of Francesco Mochi, a pupil and collaborator of Mariani, are substantially baroque, although in Mochi's work the dramatic and poetic influence of Tuscan mannerism is also apparent.

Raphael and Michelangelo dominated Roman painting in the 16th century, and their influence permeated the mannerism of their followers. Sebastiano del Piombo, Peruzzi, and Sodoma (qq.v.) came under Raphael's influence, collaborating with him in the decoration of the Farnesina (PL. 101; III, PL. 392; X, PL. 250). It should be noted, however, that Sebastiano was influenced by Venetian colorists and that this aspect of his work had an effect on Raphael himself. Among the direct followers of Raphael, Giulio Romano (q.v.) attempted a synthesis of the style of his master and that of Michelangelo, as demonstrated by his panels (PL. 208) and by his frescoes for the Sala di Costantino in the Vatican, where he was assisted by Giovan Francesco Penni (called "Il Fattore"). But only later, in the Palazzo del Te in Mantua (IX, PL. 298), was Giulio to reveal fully his bold imaginative capacity. Other followers of Raphael, such as Giovanni da Udine (PL. 206), the Florentine Perino del Vaga, and Polidoro da Caravaggio (IX, PL. 311), exploited the possibilities of a decorative style based on classical models, using stuccoes and grotesques with insets of frescoed scenes derived from Raphael himself. These three painters carried their art to Venice, Liguria, and southern Italy. Among the followers of Michelangelo, aside from such minor artists as the Venetians Marcello Venusti and Giovanni Battista Franco (IX, PL. 300), the most significant painters working in Rome were the Florentines Francesco Salviati and Jacopino del Conte (Jacopo Conte). Salviati's frescoes in S. Marcello, in the chapel of the Palazzo della Cancelleria (ca. 1550), and in the Palazzo Farnese (VII, PL. 268; IX, PL. 294), together with those in the Oratory of S. Giovanni Decollato, where he worked with Jacopino (IX, PL. 309), are among the most important mannerist works in Rome. Daniele da Volterra (Daniele Ricciarelli) painted friezes in the Palazzo Farnese, but his most important work is the *Deposition* in the Trinità dei Monti, executed with other frescoes in 1541–46. Vasari, aided by his Florentine pupils, frescoed the *Salone dei 100 giorni* in the Palazzo della Cancelleria. Toward the middle of the 16th century, the young Pellegrino Tibaldi also worked in Rome (S. Marcello; Castel S. Angelo), and Pirro Ligorio executed frescoes in S. Giovanni Decollato. Girolamo Siciolante and Scipione Pulzone (IX, PL. 297), both good portraitists, were exponents of a painting style of a chaste simplicity that was particularly inspired by precepts of the Counter Reformation. Likewise reflecting the hagiographic and didactic theories of the Counter Reformation is the cycle of frescoes (1582, in S. Stefano Rotondo) comprising a martyrology, by Niccolò Circignani, known as Niccolò Pomarancio, and others. During the mannerist period, the subject matter of works was considered more important than the quality of artists, a fact that benefited many mediocre painters from every part of Italy. Taddeo Zuccari from the Marches was the chief representative of official art among such painters as Girolamo Muziano, Giovanni Battista Ricci, Cesare Nebbia (Nebula), Andrea Lilio (Andrea d'Ancona), and Baldassare Croce (also known as Il Baldassarino). Taddeo, an erudite and skillful illustrator, was succeeded after 1566 by his brother Federico in the painting of frescoes for the Palazzo Farnese in Caprarola (IX, PL. 310) and in the Trinità dei Monti in Rome. The decoration of the Oratory of S. Lucia del Gonfalone brought together various artists of this period, including Federico Zuccari, who worked throughout Italy and abroad (England and Spain) and followed Michelangelo in the decoration of the



Rome, Collegio Romano and S. Ignazio, plan (*from P. Letarouilly, Edifices de Rome moderne, Paris, 1860*).

Pauline Chapel in the Vatican (1580–84). Federico, who was a theorist as well as a painter, also served as president of the Accademia di S. Luca. In the work of the Cavalier d'Arpino (G. Cesari), Federico Zuccari's less creative successor, Rome's eclectic late mannerism survived well into the 17th century (IX, PL. 303). However, the forces that were to open new paths for painting had already appeared. In 1597, Michelangelo Merisi, called "Caravaggio" (q.v.), was in Rome creating such works as the paintings for S. Luigi dei Francesi, and the Carraccis (q.v.) were decorating the gallery of the Palazzo Farnese. Moreover, the influx of foreign artists to Rome, a factor that was to be so important for 17th-century Roman art, had already begun. Thus, certain foreign artists came to be considered as part of the Roman mannerist movement. Such artists included the architect Jan van Santen, who was known as Giovanni Vasanzio (Casino Borghese; Frascati, Villa Mondragone) and the Flemish painter Paul Brill (frescoes in the Vatican), who was important for the subsequent development of landscape painting.

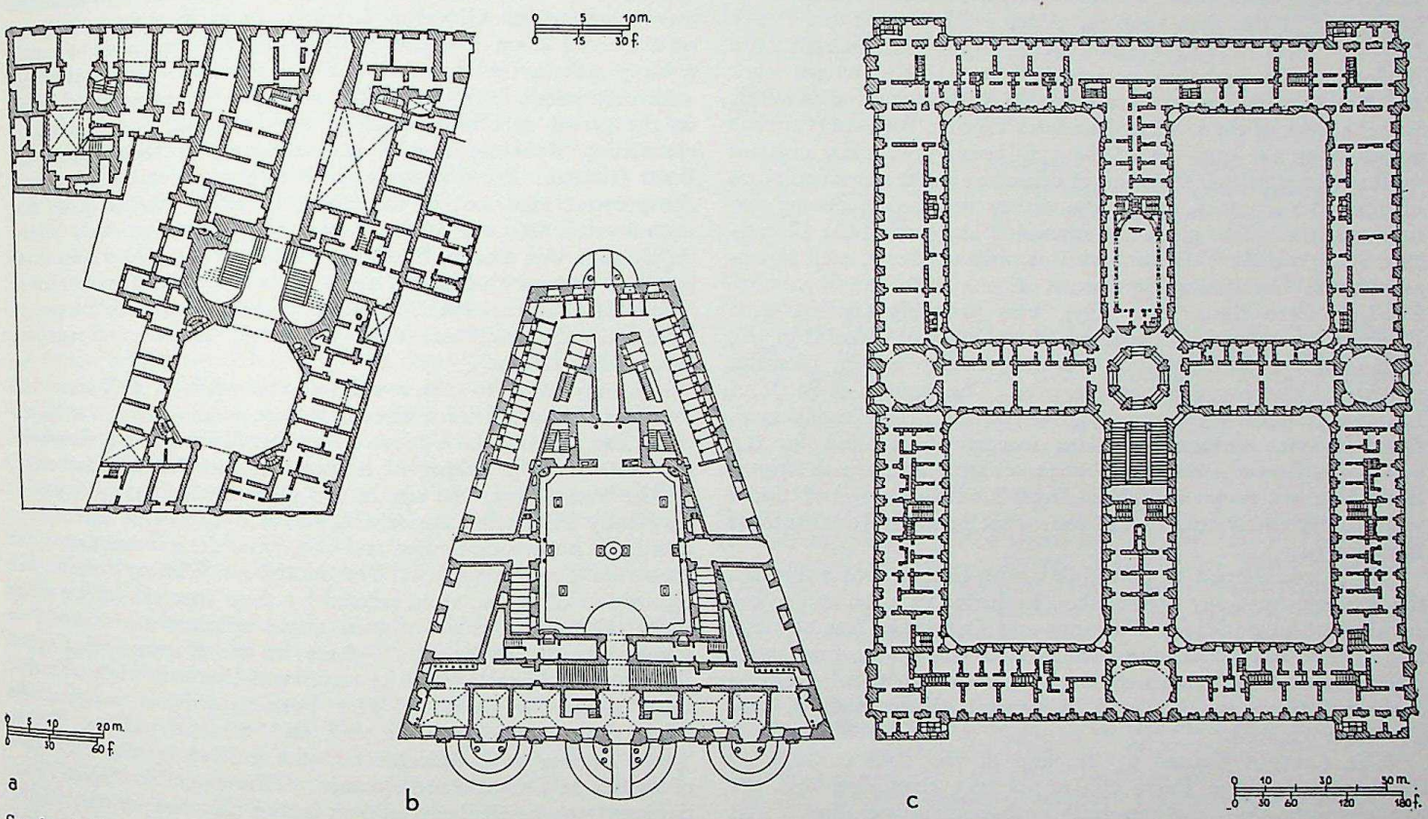
The severity of late 16th-century architecture was absorbed in the opening of space that the exuberant imagination of Gian Lorenzo Bernini (q.v.) established as the foundation of baroque expression. His art, however, encountered the resistance of such traditionalists as Algardi and Girolamo Rainaldi and the opposition of his only real spiritual antagonist, Francesco Borromini (q.v.), whose anticipation of the rococo outstripped the 17th century. In the baroque period, there was a group of architects, for the most part local artists, who outwardly complied with the new tendencies of expression but still manifested an attachment to late 16th-century styles. Among these architects were Rainaldi and the more original Giovan Battista Soria, author of the façades of S. Maria della Vittoria (II, PL. 137), S. Gregorio Magno (1633), and S. Carlo ai Catinari (1623). Others were Martino Longhi the Younger, who finished the work begun by his father, Onorio, in S. Carlo al Corso (1619–27) and designed the façade of SS. Vincenzo ed Anastasio; Vincenzo della Greca, who worked on the Palazzo Chigi and constructed the façade of SS. Domenico e Sisto; and, somewhat later, Antonio del Grande (Palazzo di Spagna; part

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

of the Palazzo Doria) and Giovanni Antonio de' Rossi (S. Pantaleo; Cappella del Monte di Pietà; Altieri and Misciattelli palaces). Pietro da Cortona (q.v.) was the third principal architect of the Roman baroque. Although somewhat related to Bernini, Pietro won distinction by an original sense of movement in his handling of architectural mass and chiaroscuro. Next in importance to Pietro da Cortona was Carlo Rainaldi, distinguished for the pictorial dynamism of his Church of S. Maria in Campitelli (I, PL. 405), for the scenographic setting of S. Maria di Montesanto (FIG. 419) and S. Maria dei Miracoli at the head of the three streets issuing from the Piazza del Popolo (II, PL. 134), and for the rear façade of S. Maria Maggiore (1673; II, PL. 132). Antonio Gherardi (called "Reatino"), who was particularly influenced by the painting of Pietro da Cortona, achieved original scenographic effects in the Chapel of St. Cecilia in S. Carlo ai Catinari (ca. 1686) and the Avila Chapel in S. Maria in Trastevere (1690). Carlo Fontana, instead, was initially linked with Bernini, whose work on the Palazzo di Montecitorio he completed. Fontana's other works include the façade of S. Marcello (1683; PL. 223), the Cybo Chapel in S. Maria del Popolo (1685) and, at the end of his career, the reconstruction of SS. Apostoli (1702–14). Fontana's sensitivity to the inspiration of Borromini in the handling of moldings and profiles was particularly advanced and marked a genuine introduction to the 18th century.

Although the Roman rococo was rather moderate, it integrated and developed the schemes projected by the imagination of Borromini, possibilities which the 17th century, dominated by the art of Bernini, had generally neglected. At this time Rome was embellished with new squares and monuments that completed its baroque appearance. Alessandro Specchi, a pupil of Fontana (Porto di Ripetta, begun 1703, now destroyed; Palazzo De Carolis, 1722–27, now Banco di Roma) and Francesco de Sanctis (with Specchi: Spanish Steps of Trinità dei Monti, 1723–25) inaugurated the development of civic construction in the 18th century. A smaller masterpiece was Filippo Raguzzini's layout of Piazza S. Ignazio with the three elegant small palaces (1727–28) that close the square. The façade of the Palazzo Doria Pamphili on the Corso (ca. 1734), by Gabriele Valvassori, is most typical of the century, although contemporaries considered it capricious and daring. Another outstanding example of the Roman rococo, executed in 1735 and attributed to Giuseppe Sardi is the façade of the Church of S. Maddalena (II, PL. 138). At the same time, however, the Florentine Alessandro Galilei virtually revived 16th-century style in Rome with the façade for S. Giovanni dei Fiorentini (1734) and with the solemn, distantly Palladian quality of the façade of St. John Lateran (1733–36). Nicola Salvi returned instead to the style of Bernini for the Fontana di Trevi (1732–44, completed in 1762 with the sculptures of P. Bracci and others; II, PL. 137). The Palazzo della Consulta (FIG. 437; II, PLS. 138, 139), the Palazzo Corsini (1732–36), the Church of S. Maria della Morte, and the façade of S. Maria Maggiore (1743; PL. 223), by the Florentine Ferdinando Fuga, have an 18th-century *brio* and elegance. Borrominian elements, ordered with a certain emphasis on the monumental, prevail in the façade of Sta Croce in Gerusalemme (1743), by Domenico Gregorini and Pietro Passalacqua (II, PL. 138). Two artists whose styles were inspired by the classical-Renaissance tradition were Luigi Vanvitelli (who worked on the renovation of S. Maria degli Angeli) and Carlo Marchionni (Villa Albani, 1760; PL. 442; Sacristy of St. Peter's; 1776–84). Piranesi, the architect of S. Maria del Priorato (ca. 1765; X, PL. 267) occupied a unique position. In architecture, as well as in engravings, he tried to evoke the classical past, freely adapting its elements and arranging them with severe and picturesque elegance.



Secular buildings, 18th cent., Rome and Campania, plans. (*a*) Naples, Palazzo Serra di Cassano (architect: F. Sanfelice); (*b*) Rome, Palazzo della Consulta (architect: F. Fuga); (*c*) Caserta, Royal Palace (architect: L. Vanvitelli).

Baroque sculpture was dominated by Bernini (q.v.) and his open forms. The Bolognese artist Alessandro Algardi (q.v.; II, PLS. 164, 168), unlike Bernini, emphasized closed academic forms and was extremely intent on the true and "picturesque" (in Annibale Carracci's sense of the word). Nevertheless, Algardi showed traces of Bernini's influence, as did to a greater degree the Fleming François Duquesnoy (also known as Francesco Fiammingo; II, PL. 168), whose less vivid personality produced works halfway between the style of Bernini and that of the classicizing tradition. The chief followers of Bernini and

Algardi were the Lombards Ercole Ferrata (II, PL. 167) and Antonio Raggi. Ferrata developed the precision and correctness of Algardi in a Berninian key; Raggi transmuted the exuberance of Bernini into an elegance that anticipated the 18th century. Tombs, chapels, narrative reliefs used as altarpieces, large decorative statues, and portraits were the chief objects of baroque sculpture. Among the sculptors active in Rome, many of whom worked with Bernini or Algardi or were pupils of Ferrata, were Andrea Bolgi, Giuliano Finelli, Francesco Baratta (all from Carrara), Melchiorre Caffà (II, PLS. 165), Francesco Aprile, Cosimo Fancelli (who was also a collaborator of Pietro da Cortona), Filippo Carcani, Domenico Guidi, Lorenzo Ottone, Bernardino Cametti (Cometti), and Giuseppe Mazzuoli (Mazzuola) the Elder. The last-named artists were at work in Rome at the beginning of the 18th century, as were the Frenchmen Pierre Legros, Pierre Etienne Monnot (X, PL. 150), and Jean-Baptiste Théodon, who had long careers in Rome and in whose work the late baroque acquired accents of 18th-century classicism. But the work of the Lombard sculptor Camillo Rusconi (PL. 223) summed up the qualities of the 17th century with the greatest vitality and provided the point of departure for the best sculptors of the 18th century. (For the artists mentioned above, see BAROQUE ART.) The grace and measured elegance of the Florentine Filippo della Valle, one of Rusconi's students, well represented the classicizing tendencies of the 18th century. The Roman Pietro Bracci (PL. 223), who probably studied with Rusconi, was the chief exponent of the style of Bernini in the 18th century. Bracci's style was rich in movement, pictorial sensitivity, and rococo scenic elegance. The Basilica of St. John Lateran contains examples by most of the artists mentioned, from Lorenzo Ottone on. Also worthy of mention for his activity in Rome is another French sculptor of Flemish origin, René-Michel (known as Michel-Ange) Slodtz. A pupil of Slodtz was the extremely refined and somewhat precious Jean Antoine Houdon (q.v.).

Rome maintained an official link with French artists through the French Academy (established in Rome in 1666 under the auspices of Louis XIV). Flemings and Dutchmen (see FLEMISH AND DUTCH ART) were also attracted to Rome — a fact about which much was written at the time (by such men as Giulio Mancini, Giovanni Baglione, Giovanni Pietro Bellori, and Giuseppe Passeri).

The ferment created at the end of the 16th century by Caravaggio and the Carraccis (qq.v.) was channeled into the two currents that characterized 17th-century painting. The Caravaggesque tendency was most important in the first two decades of the 17th century. At the same time, a classical tendency derived from the Carraccis came into vogue in Bologna. The latter tendency culminated in the courtly and cluttered decoration of the baroque period, while the taste for naturalism found expression in genre painting, after having given a vital impetus to Italian and European painting in general. Followers of Caravaggio included the Mantuan Bartolomeo Manfredi (II, PL. 179); the Roman Orazio Borgianni (II, PL. 180), who took something of El Greco's Spanish style and adroitly combined it with that of the Bassanos; the Venetian Carlo Saraceni (II, PL. 183), with his luminous color, who had some contact with Adam Elsheimer; and the Tuscan Orazio Gentileschi (q.v.; II, PL. 181), who retained the limpidity and elegance of form of his mannerist education and exercised an influence on the art of northern Europe during his sojourns in Paris and London. Roman influences also reached northern Europe through such foreigners as the Frenchmen Valentin, Georges de La Tour, and Jean Le Clerc and the Dutchmen Hendrik Terbrugghen, Gerard van Honthorst, and Dirk van Baburen (see BAROQUE ART; FRENCH ART; FLEMISH AND DUTCH ART), who had come into contact with the work of Caravaggio in Rome. Caravaggio also influenced painters of more modest gifts and less distinctive styles, such as Antiveduto Grammatica and Giovanni Pietro Baglione, the teacher of Tommaso (Mao) Salini, one of the first to paint still lifes in a Caravaggesque style. The painting of the Bamboccianti (q.v.) was also associated with Caravaggio.

An area of Roman art that can only be termed a neutral zone was that represented by the long activity of the Cavalier d'Arpino, a few other mannerists, and such semi-mannerists as Cristofano Roncalli, called "Il Cavaliere delle Pomarance (Pomarancio)," and Antonio Circignani.

Of Bolognese artists after the Carraccis, Rome knew the rigor and balance of Domenichino (q.v.), the idealistic elegance of the greatly admired Guido Reni (q.v.), and the Arcadian mythology of Francesco Albani (PLS. 218, 219). Later additions to this group were Sassoferrato (G. B. Salvi; PL. 219) from the Marches and the Calabrian Francesco Cozza, who adhered to the classicizing formalism of Domenichino. It was precisely this trend of classicizing formalism that showed the greatest divergence from the realistic orientation of Caravaggio, although during his stay in Rome Guercino's early "Neo-Venetian style" (II, PL. 197) almost gave the impression that the two currents were converging. Giovanni Lanfranco's early style was based on the pictorialism of Lodovico Carracci. Lanfranco also showed a deep sensitivity to color and light, which was combined with derivations from Correggio's work and became an element in the grand decorative style of the baroque, in which foreshortening, dynamic masses, and aerial perspective were dominant features. From about 1630 Pietro da Cortona (q.v.) was the greatest exponent of this style, in which virtually all the monumental frescoes of the baroque age were created. Pietro da Cortona was more influential than Lanfranco, who nevertheless had some influence on such followers of Pietro as Simon Vonet and Mattia Preti. Among the numerous followers of Pietro da Cortona were Ciro Ferri and Giovanni Francesco Romanelli (PL. 220).

In opposition to this trend was the work of a Roman follower of Albani, Andrea Sacchi, whose works include a handsome altarpiece in the Vatican Museums (*Vision of St. Romuald*; PL. 220) and the ceiling of a room in the Palazzo Barberini. In the latter work, the search for monumental simplicity in a classically balanced composition shows a conscious attempt to avoid the numerous figures and the dynamic foreshortenings of Pietro da Cortona's work. Yet Sacchi and Pietro, despite this opposition of styles, were related by their interest in the color tones of the Venetians, so that some scholars are inclined to speak of a "Neo-Venetian" phase in the Roman painting of this period. Nicolas Poussin (q.v.) was living in Rome at this time, while the Lombard Pier Francesco Mola returned to Rome from Venice with a rich and colorful palette. Pietro Testa, known as Il Lucchesino, was guided by the examples of Pietro da Cortona and Poussin. This so-called "Neo-Venetianism" was particularly evident in the picturesque and almost preromantic treatment of landscape. Salvator Rosa (q.v.), who was related to Mola and Testa in some respects, settled in Rome about 1650; Rosa had grown up in Naples and spent some time at the court of the Grand Duke of Tuscany.

Landscape painting had a distinctive and important development in Rome. The genre was initiated by the Fleming Paul Brill, and his concepts contributed to the formation of Annibale Carracci's "ideal" or "heroic" landscape. The German Adam Elsheimer brought a Caravaggesque luminism to landscape painting. Agostino Tassi followed the lead of Brill and Carracci and transmitted their ideas to the young Claude Lorrain (q.v.), who worked in Rome until his death in 1682. Claude's luminous visions, transmitted by the English landscape painters, were influential until the time of the impressionists. Poussin gave a humanistic intensity and a comfortable warmth to the heroic landscape; Gaspard Dughet (G. Poussin), his brother-in-law, who was born and lived in Rome, imbued the heroic landscape with a romantic passion that was evident even in his choice of subjects.

In the second half of the 17th century, the antithesis between Pietro da Cortona and Andrea Sacchi continued to influence the evolution of the two stylistic tendencies. The one tendency brought baroque decoration on the grand scale to its ultimate consequences in the work of two artists from Lucca, Giovanni Coli and Filippo Gherardi (frescoes in the Palazzo Colonna), and in that of Giovanni Battista Gaulli, known as Bacciccio or Baciccia (II, PL. 171; III, PL. 303), and Andrea Pozzo, a Jesuit from Trent (II, PL. 172). The other tendency continued to adhere to the theories of classicism. This tendency was repre-

sented by Carlo Maratti (or Maratta) of the Marches, a pupil of Sacchi who was hailed by Bellori as a new Raphael (II, PL. 204). Through the work of his numerous followers, who were active even in the 18th century, the balance and harmonious correctness of Maratti's art found its logical conclusion in the neoclassic movement.

One of the most faithful followers of Maratti was the Roman Giuseppe Chiari. Of this older generation, the principal artists were the Florentine Benedetto Luti (who turned from the tradition of Pietro da Cortona to the puristic ideal of the tradition centered around Maratti) and Francesco Trevisani (called "Romano") of Istria, who represented a new source of Venetianism in Roman painting. His style was not classicistic but adhered, rather, to the occasionally affected decorative taste of the rococo. At the same time, Rome received contributions from the Neapolitan school, which was based in the art of Luca Giordano, once a collaborator of Pietro da Cortona. Neapolitan influence was brought to Rome by Francesco Solimena (PL. 227) in 1701, and Sebastian Conca worked in Rome from 1706 to 1750 (PL. 220). Of greater importance was the intermittent, though artistically more vital, contribution of Corrado Giaquinto (PL. 227). The dominant trend in painting, however, was the more academic style of such painters as Placido Costanzi, Marco Benefial, and Pompeo Girolamo Batoni (III, PL. 307). The Roman Benefial had an almost veristic, bourgeois spirit; Batoni, of Lucca, showed considerable assurance in handling his decorative, courtly creations and cultivated classical talents, one factor which contributed to his fame as a portraitist. In direct contrast to the work of Batoni were the caricatures of Pier Leone Ghezzi (III, PL. 422), whose position in the art of the time was relatively isolated. The French classicism of Pierre Subleyras, who settled in Rome in 1728, was characterized by breadth of conception and clarity of vision. The decorative vein, on the other hand, was exploited by the virtuoso Roman fresco painter Gregorio Guglielmi, who also worked in Germany, Austria, and Russia, where in 1769 he entered the service of Catherine II.

The same two tendencies were evident in landscape painting. The Fleming Jan Frans van Bloemen and the Roman Andrea Locatelli continued the tradition of the ideal landscape, following in the line of descent from Dughet and Lorrain, while Gaspar van Wittel, known as Vanvitelli, was the first in Italy to produce views of city life based on Dutch models. Giovanni Paolo Pannini (PL. 228) adapted the scenographic ability acquired in the circle of the Galli Bibiena family to an extremely animated rendition of real and imaginary ruins. His art greatly influenced Claude Joseph Vernet and the picturesque and preromantic style of Hubert Robert. Robert was also acquainted with the engravings of Piranesi (q.v.), who transformed archaeological motifs into vivid poetic reality.

Anton Raphael Mengs' work in Rome (e.g., *Parnassus*, 1761, Villa Albani) marked a melancholy return to 16th-century idealism and, thus, in a sense, to the puristic Sacchi-Maratti tradition, as well as a decided inclination to the coolness of neoclassicism. Such able painters as Ludwig Stern, Domenico Corvi, and Giuseppe Cades could not alter the trend of the times, to which a decisive contribution was also made by Jacques Louis David and Canova (qq.v.). The lively personalities of Felice Giani and Vincenzo Camuccini (VII, PL. 268) could not prevent the incipient decline of Rome's artistic position. In the Napoleonic period Paris supplanted Rome as the artistic center of Europe.

Vaticana, IV, 1933, pp. 303–04; A. Rava, Gabriele Valvassori: Architetto romano, Capitolium, X, 1934, pp. 385–98).

THE TUSCAN SCHOOL FROM THE MANNERIST PERIOD ON. Leonardo, Michelangelo, and Raphael (qq.v.) gave to the art of Tuscany and central Italy the all-embracing idealism that characterized the 16th century, allowing Florence and Rome to become complementary centers. Tuscan artists, who were gravitating toward the mannerist style (see MANNERISM), carried the influence of 16th-century Florentine art throughout Italy and abroad, and were instrumental in widening Europe's artistic horizons.

The older Florentine painters of the 16th century (the generation born about 1475), usually schooled in the methods of Ghirlandajo and Piero di Cosimo (qq.v.), were most strongly influenced by Leonardo and Raphael, who dominated the culture of the time. The artists of the time also felt the influence of Umbrian, German, and Flemish art. The Dominican Fra Bartolommeo (q.v.; PL. 209) sought to achieve effects of monumentality in his handling of color masses that emerge from chiaroscuro backgrounds and contributed to the development of 16th-century ideals of painting. A more pictorially vibrant vision animated the work of Andrea del Sarto (q.v.), who also worked in France. Despite the fact that Andrea's handling of pictorial form was always controlled by a classicist moderation, his style formed the point of departure for the two principal Florentine mannerists, Pontormo and Il Rosso (qq.v.).

This phase of painting closely paralleled the idealized character of the sculpture of Andrea Sansovino (q.v.), who returned to Florence after a decade in Portugal. The pictorial qualities of Leonardo's style influenced both painters and sculptors, including Andrea Sansovino (and, more particularly, his pupil Jacopo Sansovino), Baccio da Montelupo, and, most notably, Giovan Francesco Rustici (bronze statue of John the Baptist, Florence, Baptistery, 1506–11), who later worked in France. Andrea Ferrucci and Benedetto da Rovezzano (Benedetto di Bartolomeo de' Grazini) maintained more traditional positions; both artists worked outside Italy as well, the former in Hungary, the latter in England and France.

Many minor artists, especially painters, belonged to this phase of 16th-century Tuscan art. Among them were Mariotto Albertinelli (collaborator of Fra Bartolommeo), Franciabigio (collaborator of Andrea del Sarto), Giuliano di Piero di Simone, Bugiardini, Francesco Granacci, Ridolfo Ghirlandajo, and such younger artists as Giovannantonio di Francesco Sogliani, Domenico Puligo, and Francesco Ubertini (Francesco d'Ubertino Verdi), known as Bachiacca.

In the third decade of the 16th century, other artists challenged the vitality of 16th-century classicism, departing from its theory of proportions and dissolving its formal language. Michelangelo's influence, abetted by the innovations of the younger artists of this period and a new taste for northern art, exerted the major force in this transformation. Among the leaders of the anticlassical trend was Pontormo, an artist of extraordinary imagination (IV, PL. 201; IX, PL. 289). Il Rosso compressed intense color into almost sculptured forms (IX, PLS. 290, 291), and the sensitive Sienese painter Domenico Beccafumi undertook similar experiments (PL. 86; IX, PL. 295). Bronzino (q.v.), court painter of Florence, cultivated closed, compact forms and was especially successful in portraits (IX, PL. 296).

The creative phase of mannerism was followed by an academic one, which, although it maintained a superficial fidelity

UP State Museum, Lucknow

CC-O. In Public Domain. Digitized by Sarayu Trust and eGangotri

to the principles of Michelangelo, was characterized by literary and rhetorical subject matter and by virtuosity of design and iridescent color. The final period of Il Rosso in France (1530–40) was essentially academic. Academicism was more evident in the work of Francesco Salviati, Giorgio Vasari, Daniele da Volterra (Daniele Ricciarelli), and Jacopino (Jacopo) del Conte, all of whom worked in Rome, as well as in Tuscany; Salviati, the liveliest of the group, also worked in Venice. Typical of this period was the decoration of various halls in the Palazzo Vecchio (including the *Studiolo* of Francesco I de' Medici; PLS. 102, 103). Vasari's numerous pupils assisted him in the execution of this work; among them were Battista (Giovanni Battista) Naldini, Tommaso d'Antonio Manzuoli (Maso da San Friano), Jacopo Zucchi, and two artists distinguished for their fresh ease of painting, Girolamo Macchietti (Girolamo del Crocefissaio), and Mirabello di Antonio Cavalori (Mirabello da Salincorno). An exotic note was contributed to the decoration by Jan van der Straet, known as Stradano, who went to Florence from Bruges.

With the loss of its skilled, formal elegance, Tuscan painting sank into tedium, notwithstanding the influence of Venetian painting, which was transmitted by the Veronese immigrant Giacomo Ligozzi and such Tuscan artists as Passignano (Domenico Cresti), who spent time in Venice. The tradition of decorative fresco painters was continued by Alessandro Allori, his son Cristofano, and Bernardino Poccetti (Barbatelli); they were followed by Santi di Tito (PL. 209), Lodovico Cigoli (Cardi), Passignano, the Circignanis, and Cristofano Roncalli, called "Il Cavaliere delle Pomarance (Pomarancio)," all of whom also worked in Rome and formed an easily recognizable current. Of notable originality in decorative fresco painting were Andrea Boscoli, who also worked extensively in the Marches, and Jacopo Chimenti. Another tendency, which derived from Federico Barocci (q.v.), appeared in Siena in the paintings of Francesco Vanni, Ventura Salimbeni, Alessandro di Agostino Casolani (called "Alessandro della Torre"), and Pietro Sorri.

In the early 16th century Tuscan architects, including the two Sangallos and Baldassarre Peruzzi, as well as Michelangelo, were attracted chiefly to Rome. The numerous Sangallo family formed the so-called "Sangallo party." Jacopo Sansovino spread the Roman taste to Venice. The influence of Michelangelo was absorbed in a decorative style of rational elegance in the architecture of Giorgio Vasari (q.v.; IX, PL. 312), Giovan Antonio Dosio (Florence, Palazzo Giacomini, now Larderel), and Bartolommeo Ammanati (q.v.), who was also a sculptor and worked with Sansovino in Venice. The style of Michelangelo was adapted with theatrical and fanciful inventions by Bernardo Buontalenti (q.v.; PLS. 430, 431; Florence, Casino di S. Marco, now Corte d'Appello, 1574; Signa, Villa di Artimino). Characteristic of this period in Florence was an interest in gardens and fountains, in which Niccolò Tribolo specialized, as well as a predilection for ephemeral decorations for public holidays, weddings, triumphal processions, and funerals.

In sculpture, mannerism was expressed in two trends. On the one hand, it found expression in the decorative exuberance of Tribolo (fountains for the Medici villas of Castello, PL. 431, and La Petraia; project for the Boboli Gardens, 1550) and Giovanni Angelo Montorsoli, who worked in Messina (fountains of Orion, 1550, and of Neptune, 1557), both former assistants of Michelangelo. On the other hand, mannerism developed into the refined elegance of certain works of Bandinelli (*Bacchus*, Pitti, 1547), Cellini (q.v.; *Narcissus*, Florence, Mus. Naz., 1548), and Giambologna (q.v.; *Mercury*, Bologna, Mus. Civ., 1564; Venus Fountain, Florence, Boboli Gardens, 1573). This manifestation of a subtle and intellectual classicism, combining virtuosity and sensuousness while avoiding the negative effects of Michelangelo's tortured monumentality, formed the most valid poetic element in the work of these sculptors. Cellini's long stay in France (1540–45) and Giambologna's northern European training established another link between Italian and European mannerism, with the school of Fontainebleau in particular. The art of Giambologna was influential in Germany and the Low Countries; in Italy it was successfully followed by the art of the Frenchman Pietro Francavilla (who worked on the bronze doors of the Cathedral of Pisa), the Florentine Taddeo Landini (Rome, statues of the Fontana delle Tartarughe, PL. 206), and Giovanni Battista Caccini, and in the 17th century by Pietro Tacca from Carrara, who also worked in Spain (Madrid, equestrian monument to Philip IV; Leghorn, statues of the Four Moors in the monument to Ferdinand I; IX, PL. 308).

Others instrumental in the diffusion of mannerism were Leone Leoni (of Tuscan family, though born and active in Lombardy), who traveled extensively as the official artist of Charles V, and Leoni's son Pompeo, who worked chiefly in Spain. The Tuscan Stoldo Lorenzi did work in Milan, while Michelangelo Naccherino and Pietro Bernini, father of Gian Lorenzo, went to Naples. Francesco Camilliani (PL. 225), Andrea Calamech, and Montorsoli traveled to Sicily, as did the painter Filippo di Benedetto Paladini (Paladino), who popularized the facile elegances of Florentine mannerism, the last important movement of a Tuscan school.

In the following two centuries, some Tuscan artists overcame their regional limitations, preserving little more of Tuscany than their origins. The sculptor Francesco Mochi (II, PL. 164; X, PL. 149) and the painter Orazio Gentileschi (q.v.; a follower of Caravaggio) were such artists. In their work, the clearness and elegance derived from their mannerist training was still evident. Other Tuscans were Pietro da Cortona (q.v.), a pupil of Cigoli, Sebastiano Mazzoni, who settled in Venice, and in the 18th century, Alessandro Galilei, who formed his style in England, and Ferdinando Fuga, a pupil of Foggini, all of whom worked outside Tuscany. Among other Tuscan artists who worked abroad were Count Bartolomeo Carlo Rastrelli and his son Bartolomeo Francesco, two Florentine architects who settled in Russia.

Local work in Tuscany, marked by a certain constitutional reluctance to accept the criteria of the baroque, became much less important. In architecture, Matteo Nigetti, a pupil of Buontalenti, retained a linear clarity (PL. 210; Florence, S. Gaetano, begun in 1604), and Gherardo Silvani maintained an acute sense of balance and measure (Florence, reconstruction of S. Gaetano, 1633–48, and of Corsini palaces). The only architect who accepted the baroque (in the field of sculpture as well) was Giovanni Battista Foggini, an artist who followed Roman models (II, PL. 169; Florence, Feroni Chapel, SS. Annunziata). The complex of buildings most characteristic of the 18th century, albeit timid in style, was the Monastery of the Filippini (S. Firenze, PL. 210), on which Ferdinando Ruggieri, and Zanobi del Rosso worked.

The attempt to revive the mannerist tradition in painting, following Emilian and Venetian models (Cigoli, Passignano, Cristofano Allori), met with small success. The diligent Matteo Rosselli fathered a populous though undistinguished school, from which the majority of 17th-century Florentine painters descended. The influence of the Fleming Justus Sustermans, a portraitist for the court of the Medici, also contributed to the unimpressive mannerist revival. His pupils included Jacopo Vignali, the affected Carlo (Carlino) Dolci, Lorenzo Lippi, who was influenced by Tirolese and Bavarian art, and Francesco Furini (PL. 209), known for his hazy and ambiguous female nudes. The more gifted Giovanni da San Giovanni, who also began as a student of Sustermans, later came to know the works of the Carraccis and Lanfranco in Rome and created a style of luminous color (Pitti, Sala degli Argenti, 1634) that had an important influence on 18th-century painting as well. Baldassarre Franceschini, called "Il Volterrano," who acquired his dexterity from Giovanni, later became a follower of Pietro da Cortona (dome of SS. Annunziata, 1680–83). By the time Pietro da Cortona returned to Florence to renovate the Palazzo Pitti and fresco its rooms (1637–47), he had become a Roman master whose international style was almost unrelated to that of the Florentine painters. His influence, together with that of Luca Giordano (dome of the Corsini Chapel, S. Maria del Carmine; frescoes in the Palazzo Medici-Riccardi, 1682–83) and Sebastiano Ricci (Palazzo Marucelli, later Fenzi, 1706), swept away what little remained of Renaissance tradition. In the 18th century Tuscan painters adopted the rococo style and were subject to Roman, Bolognese, and Venetian influences (Giovanni Camillo

Sagrestani, Pietro Dandini, Anton Domenico Gabbiani, Alessandro Gherardini, and Sebastiano Galeotti). A notable representative of this style was Giovanni Domenico Ferretti.
